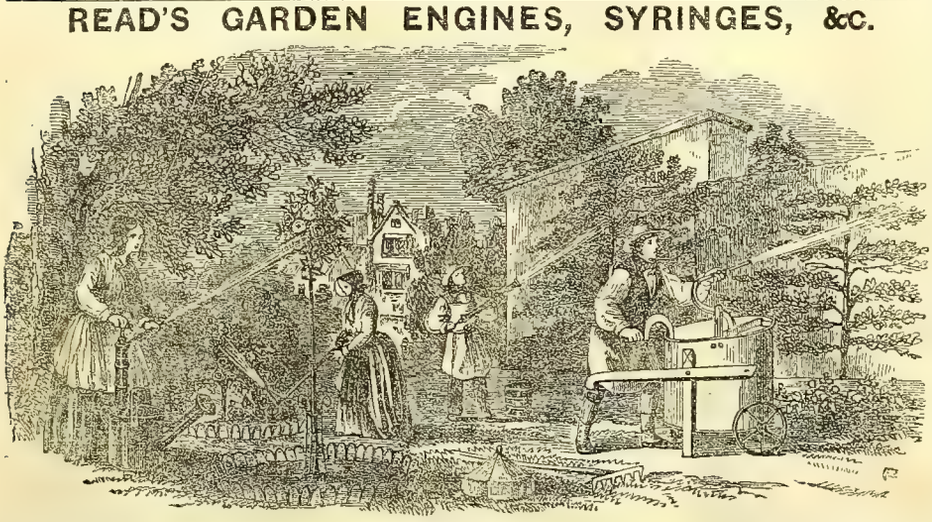
AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

READ'S GARDEN ENGINES, SYRINGES, &c.



WHEN an article of real utility attracts public attention, IMITATORS start into the field to snatch from the inventor the just reward of his labours. It has now become a daily practice of exhibiting in the windows of ironmongers and others, Syringes of the VERY COMMONEST DESCRIPTION, with the words "READ'S PATENT," as an inducement to purchasers. This, as an eminent writer on Horticulture has recently remarked on the subject, is indeed "living upon another man's fame."

READ'S Instruments have the ROYAL ARMS, with the Address—**35, REGENT CIRCUS, LONDON.**

*** A liberal discount allowed to Nurserymen, Seedsmen, &c., &c.—Descriptions sent Post Free.

WHEELER'S SHORT SELECT SEED LIST.

J. C. WHEELER AND SON'S SEED LIST *is now ready, and will be forwarded free on application. We have tried to make it as short and as select as possible, leaving out all inferior varieties, so that it is really a List of the best Seeds in cultivation. Grasses and other Agricultural Seeds, Garden and Flower Seeds, all described, and prices put to every article. We deliver our Seeds Carriage Free to almost every Railway Station in the kingdom, and take especial care that every sort we send out is true to name, and of the best quality.*

J. C. WHEELER & SON, Seed Merchants, Gloucester.

NEW ILLUSTRATED CATALOGUE,
WITH NEWSPAPER STAMP, POST FREE.
AGRICULTURAL SEEDS.

RENDLE'S NEW FARMING PRICE CURRENT, and AGRICULTURAL DIRECTORY for 1854, *Illustrated with several Engravings, is now in the Press, and will be Published shortly.*

It will be the same size as the "Garden Directory," containing 52 pages crown quarto.

This will be a good Farm Almanac and List of Fairs and Great Markets held during the year in the Western Counties.

Descriptions will be given of all the best varieties of SEEDS USED IN AGRICULTURE, and the prices of every article will be fixed, so as to be a Price Current in the true sense of the word.

It will contain a Descriptive Catalogue of all the best NATURAL AND ARTIFICIAL MANURES, with several useful remarks relating thereto.

It will also contain an Original Article, written by J. B. LAWES, Esq., of ROTHAMSTED, HERTS; and another by J. C. NESBIT, Esq., F.G.S., the celebrated Agricultural Chemist.

Also the reprint of a Lecture on Guano, by PROFESSOR WAY, the Consulting Chemist to the Royal Agricultural Society.

The Directory will be embellished with several illustrations of some of the best Agricultural Implements of the day, with letter-press descriptions of the same.

In a few words the proprietors have endeavoured to make it a useful companion to all engaged in Farming operations, and those who take an interest in the cultivation of the soil.

The "FARMING PRICE CURRENT AND AGRICULTURAL DIRECTORY," is now in the press, and will be ready shortly, and can be ordered from any bookseller, price 6*d.*; through the London Publishing Office, 294, Strand; or from the Proprietors, WM. E. RENDLE & Co., Seed Merchants, Plymouth.

RENDLE'S PRICE CURRENT.—*Opinion of Mr. James Barnes, the well-known Gardener to the Right Honourable Lady Rolle, Bicton:*—

"Dear Sir,—Your Price Current has just come safe to hand, and I beg to return my best thanks for the same. It contains a great deal of useful information for all classes, more particularly for the Amateur and those who cultivate their own Gardens and Allotments.—Yours, &c.

"JAMES BARNES."

RENDLE'S PRICE CURRENT.—*Opinion of Mr. W. Tillery, Gardener to His Grace the Duke of Portland, Welbeck:*—

"My dear Sir,—I beg to return many thanks for the copy of Rendle's Price Current and Garden Directory for 1854. As far as my experience goes, I think your Calendar of Operations excellently planned, and the Directions are judicious and quite up to the mark for the present progressive period. The remarks on the systematic rotation of vegetable cropping are likewise excellent, and will do much good if carefully put into force.—Yours truly,

"To Mr. Errington. "W. TILLERY."

RENDLE'S PRICE CURRENT.—*Opinion of the Editor of the "Midland Florist and Suburban Horticulturist:"*—

"We had last year to praise the very excellent Descriptive Catalogue of Seeds issued by Messrs. W. E. RENDLE & Co., of Plymouth. We have had the one for the present year just sent us. It certainly is the best of the kind which has ever come under our notice, and to proprietors of gardens, whether large or small, must prove eminently useful. Under the head of each Vegetable are enumerated the best varieties, with its native country, proper mode of cultivation, &c., combining the most improved systems up to the present time; added to which are Lists of Flower Seeds, proper modes and hints on sowing, with a very complete Calendar of Operations by Mr. Robert Errington, gardener to Sir P. Egerton, a sufficient guarantee of its excellence."

RENDLE'S PRICE CURRENT.—*Opinion of the Editor of the* Mark Lane Express:—

"An annual publication or Trade Catalogue of Horticultural Seeds, with lists and prices of sorted collections proper for large, moderate-sized, and small gardens; containing also various excellent hints and practical observations on the best modes to be pursued in the proper cultivation of general garden productions."

RENDLE'S PRICE CURRENT.—*Opinion of Mr. George Glenny, the Editor of many of the leading Horticultural publications of the day:*—

"THE TRADE CATALOGUE.—No documents are more interesting to the gardener than the catalogues of the trade, when such documents are original. They have ceased to be plain lists like each other, and already assume more important forms.

"RENDLE'S Price Current is a complete work, containing, independently of the lists and prices of everything, a history of the leading subjects, with directions for Culture, a general Calendar of Operations for the year, and a mass of information appertaining to the garden. The Seed Catalogue is on a plan of selection, giving assortments at various prices for large and small establishments, and there are many pages of Advertisements. It is a great improvement on the one last year."

RENDLE'S PRICE CURRENT.—*Opinion of the Editor of the* Ladies' Newspaper and Pictorial Times:—

"RENDLE'S PRICE CURRENT FOR 1854.—This is one of those publications which, from their practical utility, are sure to recommend themselves among the large class to which they appeal. Their usefulness is their great recommendation, and no one connected with gardening or horticultural operations can do without such works. The proprietors of RENDLE'S Price Current have received so much encouragement from the great success of their publication in former years, that it has stimulated them to make the present in every way worthy of the distinguished patronage enjoyed, as well as to support the high position they have gained in connection with it. Messrs. RENDLE not only give a complete catalogue of prices of the various seeds, but much useful and practical information connected with gardening. Generally, and in practice also, we may refer to the operations of the month; the present one (January) we extract in another portion of our paper, as a sample of the useful matter contained in the work, which is heartily recommended to all our fair readers who take a pleasure in the pursuits of gardening."

RENDLE'S PRICE CURRENT.—*Opinion of the Editor of the "Florist" for February* 1854:—

"RENDLE'S Price Current and Garden Directory for 1854 contains elaborate descriptive lists of vegetable and flower seeds, in addition to much other useful matter, not the least of which is a Calendar of Operations by Mr. Errington. We can only hope the information Mr. RENDLE puts before his customers may meet with a hearty response."

RENDLE'S PRICE CURRENT.—*Opinion of Mr. Wm. Ogston, Brentwood, Essex:*—

"I received your Price Current and Garden Directory for 1854. I beg to return you my most sincere thanks for the same. In looking over its contents, I find, as usual, it contains a great deal of useful, judicious directions and rotations of vegetable cropping for every person who cultivates a garden."

RENDLE'S PRICE CURRENT.—*Opinion of Mr. Hamilton, the well-known Author of the "Hamiltonian System of Pine Culture," &c.:*—

"Your descriptive remarks in RENDLE'S Price Current, together with the mode of handling the subject, eclipses everything of the kind ever published to the gardening world in that form. It will be invaluable to the young gardener and the amateur, and every practical gardener should have it as a reference. My opinion is that it will be exceedingly useful to seedsmen, and I believe that when it is known, almost every seedsman in the kingdom will purchase it."

RENDLE'S PRICE CURRENT.—*Opinion of Mr. Jennings, Head Gardener to Earl of Derby, Knowsley Hall, Prescot:*—

"Your arrangement of the Calendar reflects great credit on you, and must have proved a heavy task. The remarks about rotations, preparers, &c., will lead to much good. You really deserve the best wishes of all gardeners for the task you have performed in so masterly a manner."

RENDLE'S PRICE CURRENT.—*Opinion of Mr. D. Beaton, Surbiton, Kingston, Surrey, one of the most popular Horticultural writers of the day:*—

"I have a copy of Mr. RENDLE'S Price Current for this year, and I can tell you at once that it is the most useful Catalogue and Calendar that was ever sent out from any house of business in our line, and I do not see what more you could add to it by way of usefulness. How different from the bare-bone lists to which you and I had access, when we first took to the spade on our own account!".

RENDLE'S PRICE CURRENT.—*Opinion of Mr. Charles M'Intosh, Dalkeith Park, the Editor of the "Book of the Garden," the most sterling work on gardening extant:*—

"I am much obliged to you for your attention in sending me your nicely arranged Price Current, which is well got up, and must be of much use to your customers and purchasers generally."

RENDLE'S PRICE CURRENT.—*Opinion of the Editor of the "Southern Florist," February*, 1854.

"This work or pamphlet, as the title indicates, constitutes a Descriptive Catalogue of Vegetable and Flower Seeds offered by the Firm of RENDLE & Co., of Plymouth; but while it contains all the useful matter found in a Catalogue, copious descriptions of the newest and most approved Seeds are given, together with a mass of sound and useful information, which cannot but be valuable to the Amateur as well as the practical Gardener. It contains an Almanack for the year, a copious Calendar of Operations for each month, directions for Rotation, Cropping, &c. &c., and is stamped to go post free to any part of the United Kingdom—forming a complete newspaper of over 50 pages of useful matter."

RENDLE'S PRICE CURRENT *has been already favourably noticed by the following Newspapers and Magazines:*—

"Mark-Lane Express," "The Lady's Newspaper and Pictorial Times," "The Florist, Fruitist, and Garden Miscellany," "The Gardener's and Farmer's Journal," "The Agricultural Magazine," "The Plough," "Lloyd's Weekly Newspaper," "Plymouth Herald," "Exeter Gazette," "Bristol Mercury," "Western Luminary," "Somerset County Herald," "The Clerical Journal," "Cornish Telegraph," "Plymouth Mail," "Devonport Telegraph," "Somerset Gazette," "Western Courier," "Teignmouth Gazette," "West Briton," "Portsmouth Times," "Naval Gazette," "Southern Florist," "Midland Florist," "Stockport Advertiser," "Liverpool Advertiser," and several other Newspapers and Magazines.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church Row, Stoke Newington, both in the County of Middlesex, Printers, at their Office, in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED to THE EDITOR.—SATURDAY, FEBRUARY 18, 1854.

A remittance or reference is expected from unknown correspondents. Post-office orders made payable at Westerham.
Nurseries, Westerham, Kent.

JOHN COLE begs to inform the lovers of CALCEOLARIAS that he has a few choice Seedlings to dispose of, having succeeded in raising more than he has convenience to grow, and offers them, strong plants, at 4*s.* per dozen, or 25*s.* per 100. J. C. begs to state the seed was saved from choice impregnated spotted and striped varieties. A remittance solicited from unknown correspondents.
Keyfield Nursery, St. Alban's, Herts.

SUPERB DOUBLE HOLLYHOCKS.
WILLIAM CHATER has now ready a fine healthy stock of young plants of all the leading sorts. For price and description see General List, which also contains hints on their culture, with observations on the exhibition of Hollyhocks, &c. &c., and may be had by inclosing a postage stamp.
Saffron Walden Nursery, February 25.

"WELLINGTONIA GIGANTEA."
MESSRS. VEITCH, of EXETER and CHELSEA, have much pleasure in stating that their Seeds of the above magnificent Tree are vegetating satisfactorily. They therefore hope to be able to send out well established seedling plants during the ensuing summer and autumn. They are now taking orders for them at the following prices:—

For a Single Plant ...	2 guineas	For 8 Plants	... 10 guineas
For 4 Plants ...	... 6 guineas	For 12 Plants	... 12 guineas

And all orders will be executed strictly in the rotation in which they are received.—Feb. 25.

DOUBLE ITALIAN TUBEROSE ROOTS, 4*s.* per dozen.—The annual importation of the above-named beautiful and fragrant Flower has just been received, and large and well selected Bulbs may be obtained, without disappointment, at A. COBBETT'S Foreign Warehouse, 18, Pall Mall.
N.B. Printed regulations for treatment sent; also, just arrived, very moist and open Parmasan Cheeses.

WILLIAM NICHOLSON still continues to send out very strong well-rooted Plants of his four new and distinct varieties of STRAWBERRIES, viz., AJAX, dessert Fruit; RUBY, ditto; CAPTAIN COOK, Market Fruit; FILL-BASKET, ditto, at 15*s.* per 100, or 25 each of any two sorts for 10*s.*, box included. Post-office orders payable at Yarm, Yorkshire. For a full description, see Advertisement *Gardeners' Chronicle* Jan. 28, 1854.—Eggleseliffe, near Yarm, Yorkshire.

THE BLACK BARBAROSSA,
"A GRAPE THAT DON'T KNOW HOW TO SHANK."
JOHN BUTCHER begs to state that a Certificate of Merit was awarded to this Grape at the Horticultural Society's Meeting last Tuesday, as a mark of its excellent qualities, one of which was stated to be that "it will hang longer in a ripe state without shrivelling than any other black Grape in cultivation."
Fine Fruiting Plants, 10*s.* 6*d.*; good plants, 5*s.* 6*d.*, may be obtained of the above splendid Late Grape. London Agent, Messrs. DAWE, COTTRELL & BENHAM, 36, Moorgate Street; and JOHN BUTCHER, Nurseryman, Stratford-on-Avon.

THE EARLIEST PEA is "FAIRHEAD'S EARLY CONQUEROR." To be had of C[illegible]BEE AND Co., Borough, London; 2*s.* per quart (price per bushel on application).

SEEDS.
W. AND S. GAINES beg to offer to Gardeners, Farmers, and Nurserymen, the following seeds:—WHITE SPANISH ONIONS, 4*s.* 6*d.* per lb.; Deptford do., 4*s.* per lb.; Reading do., 4*s.* 6*d.* per lb.; quantities not less than 1 lb. SCARLET RUNNERS, 21*s.* per bushel; quantities not less than one peck. GOOD RHUBARB PLANTS: Albert, Linnæus, and Victoria, 40*s.* per 100; 6*s.* per dozen. Also collections of ANNUAL FLOWER SEEDS, packets of 60 varieties, 10*s.*; 30 do., 5*s.*; 15 do., 2*s.* 6*d.*—Post-office orders payable to W. & S. GAINES, Covent Garden Market London.

FIRST CLASS PRIZE VERBENAS.—The set of six, advertised by J. KEYNES in his Catalogue will be ready to send out the 21st of March, in fine well-established Plants, by post, free, for 20*s.*
These are six of the most beautiful Verbenas ever offered, and were much admired in the Surrey Gardens, the only place they were exhibited, and obtained First Class Certificates. Only a few sets left unordered.
JOHN KEYNES, Nurseryman, Salisbury, Feb. 18.

CONQUEROR OF THE WEST CUCUMBER.
JAMES LAKE, NURSERYMAN, &c., Bridgewater, begs once more to offer the above Cucumber. Having tested its merits against many other sorts highly spoken of, can with confidence recommend it as the best for general frame culture. Packets containing 12 good Seeds sent post free on the receipt of 12 postage stamps.
N.B. The Trade supplied with the genuine article.
J. L. also begs to state that he will be prepared to send out, the first week in May, strong Plants of his beautiful Seedling LOBELIA ST. CLAIR, so universally admired last summer and autumn, at 12*s.* per dozen. The usual discount to the Trade.

"NORFOLK HERO" CUCUMBER.—Without exception the very best Cucumber for open ground cultivation that has yet been offered. It is a most prolific bearer, as handsome as any frame variety, and is as delicate in point of texture, the fruit measuring from 16 to 20 inches in length. It is in the sole possession of YOUELL & Co., who will forward per post free (on receipt of postage stamps) packets containing six Seeds, 1*s.*; 18 Seeds, 2*s.* 6*d.*—"To Market Gardeners the above will be found a great acquisition."
Royal Nursery, Great Yarmouth.

THE FINEST BALSAMS IN EUROPE, in Six Classes; Seed saved by Mr. GLENNY from flowers three inches across: the six, 37 stamps; Mixed Seeds, 13 stamps, in Sealed Packets only, signed and sealed. The finest seeds that can be had procured to order, and all other choice Horticultural subjects.—420, Strand.

MANGOLD WURZEL SEED.—Purchasers of large quantities of Mangold Wurzel liberally supplied for cash price.—Apply (stating quantity required) to SUTTON and SONS, Seed Growers, Reading, Berks.

JOHN JEYES, NURSERYMAN and SEED-MERCHANT, Northampton, begs to offer Agricultural Seeds of every kind, and the best quality: Horticultural and Floricultural Seeds in great variety and of the choicest selection; Ornamental Shrubs and Trees of various sizes and immense variety; a Fine Collection of Roses; Fruit Trees carefully selected from the finest proved sorts; a large Stock of Forest Trees; Russian Mats.
Plans and Estimates given for making Pleasure Grounds, Cemeteries, &c. Seeds selected and packed for Exportation.
Experienced Gardeners recommended.

BASS & BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

ESTABLISHED ABOUT HALF A CENTURY.

HIGHGATE NURSERIES, NEAR LONDON.

JAMES CUTBUSH, with deep regret, begs to inform his Customers and the Public generally of the sudden and lamented death of his Father (WILLIAM CUTBUSH), and offers his sincere thanks for the kind and extensive Patronage he received for upwards of 33 years. J. C. also acquaints them that the business will be conducted as hitherto under the name of "WM. CUTBUSH & SON" by himself, and humbly solicits a continuance of their esteemed favours; and by unremitting attention hopes to merit their support and recommendation.

EDWARD GEORGE HENDERSON AND SON beg to inform their Patrons and the Public that their Catalogue of Seeds for 1854 is now ready, and will be forwarded post free on application.

E. G. H. & SON take this opportunity of stating that none but the most popular and improved kinds of Vegetable Seeds appear in their List; and among the Flower Seeds only those whose beauty and merit are universally acknowledged, together with a carefully selected stock of the principal new varieties.

E. G. H. & SON beg respectfully to call particular attention to the following choice Seeds of Florist Flowers, which have been saved from a fine collection of named sorts, and also the annexed new Annuals, which they can confidently recommend.

CHOICE FLORIST FLOWERS.

Wellington Nursery, St. John's Wood, London, Feb. 25.

EDWARD GEORGE HENDERSON AND SON, Wellington Nursery, St. John's Wood, London, begs to inform their Patrons that they have purchased the stock of that beautiful HYBRID CYCLAMEN, exhibited at the Horticultural Society's Rooms, Regent Street, in 1852, and again last Tuesday, a Certificate on each occasion being awarded. The Plants can now be seen at the Nursery in bloom, and orders booked for the following season, when flowering plants will be supplied at 10s. 6d. each.—February 25.

PRIMULA SINENSIS MAGNUM BONUM.—Was raised by Mr. Hayes, of Edmonton, by whom it was named and exhibited at the Horticultural Society's Rooms in Regent Street, the entire stock of which we purchased. The colour is far superior to the finest fimbriated purple variety; indeed, it has the richest shading of purplish crimson one can imagine. The eye is large and very conspicuous, of a beautiful yellow. The fimbriation of the flower is so fine that it has more the appearance of a double flower. The habit of the Plant is very robust and vigorous; the leaves have a remarkably stout footstalk with thick leathery foliage, and instead of the plant degenerating after the first season's flowering the fimbriation of the flower is much improved and the foliage of a handsome formation. One surprising feature of this plant is, that the Seedlings have all flowered correctly for three generations. Young Plants are now ready for delivery, price 10s. 6d. each.

N.B. On account of the seed being sown late, the plants are too small to be allowed to flower this season, as the consequence would be a very poor flower, not distinguishable from the ordinary varieties, but the plants should now be potted and grown on freely from this time for the ensuing winter, by which time they will produce splendid specimens of the most gorgeous coloured flowers in cultivation.

E. G. HENDERSON & SON, Wellington Nursery, St. John's Wood.—Feb. 25, 1854.

NEW PLUMS.

HENRY DOWLING, FRUIT-GROWER, Woolston Lawn, Southampton, most respectfully begs to return his sincere thanks to the Nobility, Gentry, and Public generally, for the most liberal patronage he has received, and informs them that he has none of the Standard of England, but can supply good strong plants of the Angelina Burdett and Black Gage, which can be obtained at Mr. C. TURNER'S, Royal Nursery, Slough, or from the Grower. See the *Florist* for December, or *Gardeners' Chronicle* of November 5th or 12th for testimonials and particulars.

Woolston Lawn, February 25, 1854.

THE ROYAL MOSS-POD PEA.—The attention of horticulturists and of the public in general is called to this new and peculiar PEA, as being surpassed by none in exquisite flavour and colour on table; it is at the same time highly productive. To be had only of Mr. DENNIS, West Court, Detling, Maidstone, at 2s. 6d. per quart, and will be forwarded in any quantity (not less than a quart), to all parts of the kingdom, on receipt of postage stamps or post-office order for the amount.

SEED TRADE AND OTHERS.

W. J. EPPS begs to offer the following SEEDS, received direct from the Growers. Excellent samples and prices sent on application.

PEAS.

Early Emperor (very true)	Scimetars (true)

Maidstone, February 25.

MELON SEED.—All the newest and best varieties warranted true to name, at 1s. per packet, including MATCHLESS, a superb scarlet flesh (new); GOLDEN PRINCE unequalled, green flesh (new); LONDON IMPROVED green flesh Melon (new); and all the leading kinds in cultivation, at J. BURLEY and Co.'s, Acacia Nursery, Acacia Road, St. John's Wood, London.

NURSERY, BANBURY.

THOMAS PERRY begs most respectfully to inform the Nobility, Gentry, and those who are in want of unusually fine Evergreens, of a size that will produce immediate effect, and yet transplant with perfect safety, that he has a fine stock of the best kinds. He has also a large quantity of well transplanted Forest trees suitable for planting where profit is an object. His Rose trees, of the most beautiful and select new kinds, are, as usual, very fine. His general Nursery Stock is of such a character as he flatters himself would well repay the trouble of inspection; he therefore solicits that honour of all those who, having to plant or form new gardens, are desirous of taking advantage of the present suitable weather for the purpose. He begs to add that he has made such important reductions in his scale of charges as he trusts will completely meet the views of his patrons.

CHARLES ALEXANDER (late of DICKSONS & Co.), SEEDSMAN and FLORIST, 32, West Register Street, Edinburgh. His Descriptive Catalogue of Select Garden and Flower Seeds is just published, and will be forwarded free on application.

SUTTON'S GRASS SEEDS.—EXTRACT OF A LETTER FROM DR. LINDLEY:—

"Messrs. SUTTON,—*We have already made a trial of your Lawn Grass Seeds, and it is but justice to say they have proved the best we have sown for many years.*

(*Signed*) "JOHN LINDLEY.

"*Horticultural Society*, 21, *Regent Street, London, Nov.* 9, 1853."

Messrs. SUTTON are continually receiving similar letters of commendation of their Lawn Grass Seeds. Price of seed, 1s. 3d. per lb., 3s. per gallon, or 21s. per bushel, CARRIAGE FREE, except very small quantities. The quantity required is 40 lbs. per acre, in forming new lawns, or from 10 to 20 lbs. per acre for improving old lawns.—JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

WHEELER'S SHORT SELECT SEED LIST.

J. C. WHEELER AND SON'S SEED LIST *is now ready, and will be forwarded free on application. We have tried to make it as short and as select as possible, leaving out all inferior varieties, so that it is really a List of the best Seeds in cultivation. Grasses and other Agricultural Seeds, Garden and Flower Seeds, all described, and prices put to every article. We deliver our Seeds Carriage Free to almost every Railway Station in the kingdom, and take especial care that every sort we send out is true to name, and of the best quality.*

J. C. WHEELER & SON, Seed Merchants, Gloucester.

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY FOR 1854.—*The opinions of the following gentlemen, well known in the Horticultural world, will be found in the back page of the* GARDENERS' CHRONICLE *of February* 18 :—

Mr. JAMES BARNES, the well-known Gardener to the Right Honourable Lady Rolle, Bicton.

Mr. W. TILLERY, Gardener to his Grace the Duke of Portland, Welbeck.

The Editor of the "Midland Florist and Suburban Horticulturist."

The Editor of the "Mark Lane Express."

Mr. GEORGE GLENNY, the Editor of the "Quarterly Review of Horticulture," the Gardening department of *Lloyd's Weekly Newspaper*, and several other periodicals.

The Editor of the *Lady's Newspaper and Pictorial Times.*

The Editor of the "Florist, Fruitist, and Garden Miscellany."

Mr. WILLIAM OGSTON, Brentwood, Essex.

Mr. HAMILTON, the well-known Author of the "Hamiltonian System of Pine Culture."

Mr. JENNINGS, Head Gardener to the Right Honourable the Earl of Derby, Knowsley Hall, Prescot.

Mr. D. BEATON, Surbiton, Kingston, Surrey, one of the most popular Horticultural writers of the day.

Mr. CHARLES M'INTOSH, Dalkeith Park, Editor of the "Book of the Garden," the most sterling work on gardening extant.

The Editor of the "Southern Florist."

It has also been favourably noticed by the following Newspapers and Magazines:—"The Cottage Gardener," "The Gardener's and Farmer's Journal," "The Agricultural Magazine," "The Plough," "Plymouth Herald," "Exeter Gazette," "Bristol Mercury," "Western Luminary," "Somerset County Herald," "The Clerical Journal," "Cornish Telegraph," "Plymouth Mail," "Devonport Telegraph," "Somerset Gazette," "Western Courier," "Teignmouth Gazette," "West Briton," "Portsmouth Times," "Naval Gazette," "Stockport Advertiser," "Liverpool Advertiser," and several other Newspapers and Magazines.

DILCOCK'S BRIDE BROCCOLI.

BAINBRIDGE AND HEWISON (late Jas. Edward), have the pleasure of again offering to their friends and the public their DILCOCK'S BRIDE BROCCOLI, at 2*s.* 6*d.* per packet; and while returning their thanks to their numerous patrons of last season, they beg to refer them to the following extract, taken from the *Yorkshireman* newspaper of the 30th of April last, when it was exhibited at York, for the fourth time:—"Mr. Dilcock deservedly obtained all the three prizes for Broccoli with his seedling—the 'Bride.' Taking the season into account, these vegetables were really remarkable specimens." It was equally successful the two previous years

B. & H. are prepared to send out their Catalogues of Kitchen Garden and Flower Seeds, post free, on application, and also their Catalogue of Plants early in March, containing Stove, Greenhouse, &c., including many of the newest and choicest of the season. Their Seeds will be of the very best quality, and in the greatest possible variety.

Sold Wholesale by NOBLE, COOPER, & BOLTON, Fleet Street; CHARLWOOD & CUMMING, Covent Garden; and by all respectable Seedsmen in town and country.—York Nurseries, Feb. 25.

SUPERB LATE WHITE BROCCOLI—"EMPEROR."

EDMUND PHILIP DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletson, Market Gardeners, Thorngumbald, near Hull, begs to announce that he is prepared to send it out in sealed packets at 2*s.* 6*d.* each. This Broccoli has been raised by the Messrs. Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. Is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

May be had of Messrs. NOBLE, COOPER, & BOLTON, 152, Fleet Street; and Messrs. HURST & M'MULLEN, 6, Leadenhall Street, London. Also of the Advertiser, 57, Queen Street, Hull.

PEAS! PEAS! THE BEST VARIETY IN CULTIVATION.

CHAMPION OF ENGLAND, a blue wrinkled Pea, very productive, of quick growth, and of a most delicious flavour. This extraordinary Pea combines in one the merits of all others, and has none of their demerits; for, although a wrinkled Pea, it is both hardy and early, and being of quick growth, it is the best kind to plant throughout the season for each crop. It is highly productive, bearing very long pods of a lively green, which are well filled, and the Peas are generally as large as small horse Beans, of a deep green colour, and beyond all others of a most delicious flavour. Height, 3 ft. to 3½ ft.

Price, in quantities of not less than 1 peck ... Bag included 6*s.*
" " " 1 bushel ... ... " 16*s.*
" " " 1 sack (4 bushels) " 60*s.*
" " " 8 bushels (1 qr.) " 106*s.*
" " Delivered, freight paid by Railway to London.

Orders, with remittance or satisfactory reference, will have immediate attention on application to

H. AND A. WALLIS, SEEDSMEN, Ipswich.

HAWKES' CHAMPAGNE RHUBARB.—This most desirable variety is now for the first time offered to the public. It has stood the severest test that can be applied, and has beaten everything in Covent Garden and other London Markets in realising higher prices, from its magnificent colour and size. It has been seen by the very highest authorities and pronounced to be a most valuable introduction. In earliness it equals the Prince Albert, but of a deeper colour, and much greater bearer. It forces remarkably well, and is very hardy out of doors. Mr. HAWKES has placed the entire sale in the hands of Duncan Hairs.

One-year-old plants, strong, 5*s.* each. A few two years old, very strong, for sale.

LAING'S MAMMOTH RED CELERY.—This is considered the largest yet grown, attaining the extraordinary weight of from 10 to 12 lbs., and at the same time perfectly solid. It is nearly perennial in its habit, as it will not, under any circumstances, run to seed the first season, and it is difficult sometimes the second when planted out for that purpose. In colour it is a bright red. In flavour unsurpassed, if equalled.

It has been seen growing by many practical gardeners, who deem it a new feature in the garden, from the fact that it may be had nearly all the year. Packets 2*s.* 6*d.* each.

MITCHELL'S HARDY EARLY CAULIFLOWER.—This is grown precisely as the handglass variety, but when removed from the frame does not require the same protection, and comes in immediately after. This is particularly recommended for gentlemen's establishments. The head is not large, but handsome and compact, and is so firm that you may let them stand from 10 days to a fortnight and they will not get frothy or loose. This is quite a distinct variety. Packets 2*s.* 6*d.* each.

DUNCAN HAIRS, Seedsman, 109, St. Martin's Lane. Post Office orders to be made payable at Charing Cross.

NEW POTATO—DEAN'S SEEDLING.

ABRAHAM STANSFIELD, in sending out the above Potato, would particularly recommend it to the attention of all growers of this useful esculent, as being, all properties considered, the best sort yet raised. Like its parent, the Fluke, it is less liable to be diseased than any other variety, remaining vigorous and healthy when all others are cut down. It is about three weeks earlier than the Fluke, much superior in its farinaceous properties, has shallow eyes, a slight roughness of the skin, and is every way a superior variety for the table. It was exhibited at the Hapton and Padiham Exhibitions in 1852 and 1853, at each of which it received the first prize; it was also exhibited at the East Lancashire Horticultural Exhibition, and received a certificate of merit. It also received the following testimonial:—

"Burnley, Sept. 22, 1853.

"We, the undersigned, beg to testify to the merits of a seedling Potato raised by James Dean Hapton, as being a very useful table variety, good keeper, and hitherto free from disease."—Signed, H. Walton, Florist, Marsden; R. Taylor, Gardener to Le Gendre Starkie, Esq., Huntroyd, near Burnley; T. Whitham, Gardener to J. Hallam, Esq., Marsden Hall, near Burnley; J. Redman, Gardener to Charles Townley, Esq., Townley, near Burnley; J. Lewis, Gardener to W. Thursby, Esq., Ormerod House, near Burnley; J. Dean, Gardener to Rev. W. Masters, Burnley, and many others.

The *Preston Guardian* of Sept. 24, 1853, in noticing the East Lancashire Exhibition, says, "Amongst the roots shown we particularly noticed a splendid sample of Potatoes—Dean's Seedling—which possessed the recommendation of a rough skin and being free from eyeholes. Several had been boiled, and they appeared all that could be wished in a Potato."—The same paper of Oct. 1st says, "That important desideratum, a Potato free from disease, has been raised by Mr. Dean, near Burnley." Mr. Glenny, in the "Gardeners' Almanack" for 1854, says "We ought to mention a capital and very handsome new sort of Potato, Dean's Seedling, handsome and well flavoured, and moreover an excellent boiler." Mr. Edwards, secretary to the National Floricultural Society, in a private letter, says Dean's Potato is a perfect gem.

A. STANSFIELD will commence sending out the above Potato the second week in February, at 7*s.* per stone of 14 lbs., sacks and bags included. Early orders are respectfully solicited, as the stock is very limited. Post Office Orders or reference are requested from unknown correspondents.

A. S. can also supply the genuine Fluke Potato, at 9*s.* per bushel of 56 lbs., sacks and bags included.

Vale Gardens Todmorden, Lancashire.

NEW FUCHSIAS AND DAHLIA PLANTS, AND CUCUMBER SEEDS.

J. BATTEN, FLORIST, will send out, after Feb. 20, strong plants of the following FUCHSIAS:—

GRANDISSIMA—Deep claret corolla, long white tube, good habit.

MR. CHARLES PALMER—Scarlet corolla, white tube, broad inverted sepals, fine habit; first-class certificate at Hackney.

ADMIRAL—Light crimson corolla, light tube, free bloomer.

At 7*s.* 6*d.* per plant, or the set for 20*s.*

BUSHELL'S LONDON DON DAHLIA—Colour scarlet orange, rivalling the Duke of Wellington, at 5*s.* per plant, in May next.

BATTEN'S CUCUMBER SURPRISER—Black spine, fine flavour, and first-rate for exhibition. Sealed packets of six seeds for 2*s.* 6*d.*—Brook Street, Clapton, Feb. 18.

RARE AND CHOICE FLOWER SEEDS.

WM. P. AYRES begs to recommend the following as of first-rate quality.

	Per packet.—*s.* *d.*
Fancy Pelargoniums, from the choicest impregnated varieties	2*s.* 6*d.* to 5 0
Sweet-scented Pelargonium, impregnated with fancy kinds	2*s.* 6*d.* to 5 0
Fuchsia, from the best varieties	1*s.* to 2 0
Tigridia, four varieties, mixed	1 0
Forget-me-Not, pure white, a splendid bedding plant	2 0
Forget-me-Not, from Russia, splendid blue bedding plant, for spring	2 6
Intermediate Stock, true scarlet	1 0
Dwarf Late White Celery, the finest in existence	1 0
Cole's Crystal White	1 0
" Dwarf Red	0 6
Broccolies, six proved kinds for succession	4 0
Cox's Prolific Cucumber, the finest flavoured kind grown, and very hardy	1 6

A Post-office order payable at Greenwich, or postage stamps, indispensable from unknown correspondents.

*** See Advertisement of Fancy Pelargoniums in last week's *Chronicle*.

IMPORTED GERMAN FLOWER SEEDS.—

	s. *d.*
QUILLED DOUBLE GERMAN ASTER.—Assortment of 24 splendid varieties, containing of each colour 100 seeds	5 0
Ditto, 12 splendid varieties	2 6
DWARF DOUBLE GERMAN ASTER.—Assortment of 16 most splendid varieties, of each colour 100 seeds	3 6
Ditto, 12 splendid varieties	2 6
DWARF GERMAN STOCK.—Assortment of 36 most splendid varieties, each colour separate	7 6
Ditto, 24 ditto ditto	5 0
Ditto, 12 ditto ditto	2 6
NEW LARGEST FLOWERING DWARF TEN-WEEKS' STOCK.—This new acquisition has been greatly admired. The flowers are exceedingly large. The colours are rose, purple, blue, light blue, and white, per packet	1 0
DWARF GERMAN WALLFLOWER-LEAVED TEN-WEEK STOCK.—Assortment of 12 splendid varieties, containing of each variety 100 seeds	3 0
BRANCHING GERMAN TEN-WEEK STOCK.—Assortment of 12 varieties, containing of each variety 100 seeds	3 0
NEW ROSE PURPLE EMPEROR STOCK, per packet	1 0
WALLFLOWERS.—Collection of eight splendid varieties	3 0
DWARF DOUBLE LARKSPUR.—Collection of 10 most splendid varieties, containing of each colour one-eighth of an ounce	5 0
TALL DOUBLE LARKSPUR.—Collection of 8 splendid varieties, containing of each colour one-eighth of an ounce	3 6
ZINNIA ELEGANS.—Collection of 6 beautiful varieties	2 6

We can strongly recommend the above as being of first-rate quality. They will be forwarded postage free.

J. C. WHEELER AND SON, GLOUCESTER.

CORN MARKET, WISBEACH, CAMBRIDGESHIRE.

CHARLES SHARPE begs to call the attention of the nobility, gentry, and trade to the undermentioned choice collection of SEED POTATOES, grown with great care upon marsh land near the sea, which is the most appropriate soil for the culture of the Potato, as it is less affected by the disease, and of finer quality. The undermentioned prices include hampers and package. Smaller quantities can be had if required. The Trade Price can be had on application.

POTATOES (FOR FORCING AND EARLY PLANTING).

Per bushel of 4 stones.		Per bushel of 4 stones.	
Early Ash-leaf Kidney	12*s.*	Early Flourball (Rylott's)	12*s.*
" (Jackson's)	12*s.*	" Round Frame	12*s.*
" Emperor	12*s.*	" Cockney	12*s.*
" Fox's Seedling	10*s.*	" Oxford (very true)	12*s.*

POTATOES (FOR SECOND PLANTING AND LATE CROP).

Per bushel of 4 stones.		Per bushel of 4 stones.	
American Native	10*s.*	Kentish Kidney	8*s.*
White Rough	8*s.*	White Kidney	8*s.*
Yorkshire Regent	8*s.*	British Queen (this is the largest producer and best quality in cultivation)	12*s.*
Forty Fold	10*s.*		

SUPERB FLOWER SEEDS for early sowing, sent post free at the annexed prices:—Antirrhinums, from 50 best striped and spotted kinds, 1*s.*; Aquilegia, from select kinds, 6*d.*; Auricula, fine, 1*s.*; Balsam, extra double, from 30 best varieties, 1*s.*; Cineraria, new kinds, 1*s.*; Calceolaria, choice kinds, 1*s.*; Carnation, fine, 1*s.*; Digitalis, from large spotted kinds, 6*d.*; Delphinium, fine, 6*d.*; Double Daisy, fine, 6*d.*; Gloxinia, from 30 kinds, 1*s.*; Hollyhock, from show flowers, 6*d.*; Mimulus, from 12 kinds, 6*d.*; Petunia, fine, 1*s.*; Phlox Drummondi, from 30 fine kinds, 6*d.*; Potentilla, fine, 6*d.*; Pentstemon, from 12 kinds, 6*d.*; Polyanthus, fine, 6*d.*; Verbena, from 100 best kinds, 1*s.*; Sweet William, fine large, 6*d.*; Zinnia elegans, from 12 fine kinds, 6*d.*; 12 fine varieties hardy Perennials from America, 3*s.*; 50 fine varieties of hardy Annuals, 4*s.*; 30 do., 2*s.* 6*d.*; 12 do., 1*s.*—WM. KNIGHT, Florist, 53, High Street, Battle, Sussex.

NEW VARIEGATED PLANT—DAHLIA MACULATIFOLIA.—This magnificent Hybrid was raised by Mr. J. Cordery, Florist, Porma Place, Kent, and is pronounced by all growers who have seen it to be a grand acquisition to the section of plants employed for ornamental purposes; its height is from 3 to 4 feet, with dark green foliage, thickly blotched with a creamy white; lively rose coloured flowers, with the petals striated with deep red, which gives it a very striking and handsome appearance, and whose merits will not fail in obtaining the admiration of all who are lovers of the beautiful tribe of variegated plants (for opinion, see Harrison's "Cabinet," for Dec. 1852 and Dec. 1853), will be offered to the public, the 1st May next. Strong plants, 7*s.* 6*d.* each.—All orders addressed to Mr. J. COURCHA, Florist, Wellington Row, Hart's Lane, Bethnal Green Road, London.

*** Orders from unknown correspondents will not be attended to unless accompanied by a Post-office Order, made payable at the Post-office, Shoreditch.

KNAP HILL NURSERY, WOKING, SURREY.

WATERER AND GODFREY, Nephews and Successors to the late HOSEA WATERER, respectfully invite the attention of parties engaged in planting to the following list:—

Araucaria imbricata, 2, 3, 4, 5, and 6 feet high, in the open quarters, regularly removed every year, and as robust and handsome as it is possible to get them. We have a large stock.

Cryptomeria japonica, 2, 3, 4, 5, 6, to 8 feet.

Cedrus Deodara, stout handsome plants from seed, in any quantity, and of all heights from 1 to 7 feet. A few splendid specimens 10 to 15 feet; warranted to transplant with perfect safety.

Cedar of Lebanon, 2, 3, 4, 5, 6, 7 to 10 feet. These large Cedars of Lebanon are also very handsome trees.

Cupressus macrocarpa, or Lambertiana, 2, 3, 4, 5, 6, and 8 feet, all from seed.
" Goveniana, 2 to 3 and 4 feet.
" Funebris, 2 and 3 feet.
" thyoides variegata, 2, 3, and 4 feet.
" Variegated White Cedar, a scarce but most beautiful variegated plant, seldom seen except at Elvaston Castle. We hold a large quantity.

Juniperus Bedfordiana, fine plants, 3, 4, and 5 feet.
" Chinese, 2, 3, 4, 5, 6, 8, and 10 feet.
" repandus, 3, 4, 5, to 8 feet.
" Upright Irish, 3, 4, 5, 6, 7, and 8 feet; perfect columns.
" and, except at Elvaston, unequalled.
" Virginiana, the Red Cedar, 4, 5, 6, and 8 feet.

Taxodium sempervirens, 2, 3, 4, 5, and 7 feet.

Yew, common, 3, 4, 5, to 8 feet high.
" Irish, 3, 4, 5, to 10 feet. A splendid lot, all being trimmed to one stem; it adds much to their appearance and value.
" Gold striped, 1, 2, and 3 feet.
" do. worked on the Common, with fine heads, 4, 5, 6, and 7 feet high; very handsome.
" elegantissima (new striped) standards. The golden Yews are very ornamental, and we have a large quantity of fine plants.
" Dovaston, or Weeping Yew, fine standards.

Pinus Douglasi, 3, 4, 5 and 7 feet; a few magnificent plants, 10 to 12 feet high.
" insignis, 2, 3, 4, 5, 6, and 7 feet; all from seed.
" cembra, 3, 4, to 6 feet.
" Canadensis (Hemlock Spruce), 3, 4, and 6 feet.
" morinda, 3, 4, and 6 feet.
" Menziesii, 3, 4, 6, and 8 feet.
" cephalonica, 3 to 4 feet.
" Pinsapo, large and handsome, 3 and 4 feet.
" Nordmaniana, from seed, 1½ foot; a few larger, 2 feet.
" nobilis, stout plants, with perfect heads, about 1½ foot; a few larger specimens, 3 and 4 feet. We hold a fine stock of this beautiful Fir, none of which are grafted.

Thuja Arbor-vitæ, American, 3 to 6 feet. We recommend this plant for hedges.
" Weareana, 3 to 6 feet, one of the few really hardy and most useful evergreens.
" aurea. This is perhaps one of the prettiest plants of the day; it was first sent out from this Nursery, and our stock, for size and beauty, is unsurpassed.

Libocedrus chilensis, 1½, 2, and 3 feet. This is a very distinct and beautiful plant, of recent introduction. Our stock is large and good.

Independent of the foregoing we are very large holders of the most useful Evergreens, Deciduous and Ornamental Trees, and of large size. Priced Catalogues will be forwarded on application, enclosing two postage stamps, which will also include a Descriptive Priced Catalogue of the celebrated collection of American Plants grown at this Nursery.

The Nursery is near the Woking Station, and about an hour's ride from London. A visit is earnestly solicited from all who intend planting during the forthcoming season.

NEW AMERICAN WHITE-FLOWERED FLAX.

FREDK. AD. HAAGE, JUN., NURSERYMAN and SEEDSMAN, Erfurt, Prussia, offers Seed of the above at 3*s.* per lb. This species was discovered by Sir Robert Schomburgk, at the source of the Orinoco. It supersedes the common cultivated Flax in size of growth, fineness and whiteness of fibre, which is extremely strong and silk-like. Its great importance cannot too strongly be recommended. Specimens of the plant fibres may be had on application. Orders will be received by Mr. JAMES CARTER, Seedsman, High Holborn, London.

Erfurt, February 25.

The Gardeners' Chronicle.

SATURDAY, FEBRUARY 25, 1854.

MEETINGS FOR THE ENSUING WEEK.

		Botanical	8 P.M.
FRIDAY,	— 3	Royal Institution	8½ P.M.
		Asiatic	2 P.M.
SATURDAY,	— 4	Medical (Annual Election)	7 P.M.

At the meeting of the Horticultural Society last Tuesday, there were some highly interesting illustrations of the quality of the timber of DEODAR and CEDAR OF LEBANON. Now, for the first time, has some really good evidence been produced in Europe concerning a most important question, hitherto involved in doubt, or elucidated only by testimony upon which it has not been found difficult to throw distrust. The beauty of the Deodar or Indian Cedar has rendered it so universal a favourite, and has led to such extensive plantations of it in this country, that everybody is desirous of knowing whether its quality as a timber tree at all corresponds with its value as an ornamental object.

That Deodar wood is of high value in India, we know from a great variety of evidence, which we need not now repeat. Such of our readers as are uninformed upon the subject will find it fully stated in Dr. ROYLE's able report to the Woods and Forests, which was lately transferred to our own columns (see p. 20). But it has been suggested that in the first place, its value may be over estimated in India, in consequence of the inferiority of the other kinds of timber with which the natives have to compare it. This idea was shown on Tuesday by Dr. ROYLE to be founded upon misapprehension, the districts where Deodar is largely used abounding in other kinds of wood of great excellence. It was also still

more effectually disposed of by the exhibition of a slab of this timber, 18 feet 6 inches long, 4 feet 6 inches wide, and 4 inches thick, recently imported by the East India Company for the express purpose of submitting it to European criticism. Four such slabs have arrived from India at the cost of the Court of Directors, to whose princely liberality the country has been indebted, year after year during many years, for an ample and gratuitous supply of the seeds of this invaluable tree. No one conversant with such subjects could look at the huge specimen without recognising in it a description of timber ranking among the highest of its class, that is to say among Firs or Deals. Clean from end to end, massive, free from knots, towards the outside so close grained that it was difficult to count its rings of growth, and fragrant as sandal wood, it completely realised in appearance all that had been expected from the tree. But what was much more important, Dr. Royle produced a report from Mr. Wilson Saunders, and other gentlemen of Lloyd's, pronouncing it to be admirably adapted to shipbuilding. In their estimation it ranked between the best kind of Larch and hard woods. Some of the fastest clipper ships now afloat are constructed of Hackmatack or American Larch, and the Deodar timber was, in their opinion, superior to Hackmatack itself.

It has also been urged upon those disposed to plant Deodar for profit in this country that, although its timber possesses high value in India, it is not likely to be good in the North of Europe, because of the unfavourable nature of the latter climate. Of this Dr. Royle disposed by pointing out that there is in reality no such difference between the climate of the Indian Mountains upon which the finest Deodar is produced, and that of our own islands, as can justify such an hypothesis; and he showed that more especially in dampness, coldness, or mere exposure, the Deodar districts of India are essentially the same as Great Britain.

Another great hypothetical argument against growing Deodar in this country for profit has been drawn from the supposed difference between the wood of the Cedar of Lebanon on Lebanon, and that produced in England. It has been said that though the Cedar of Lebanon may be of great excellence on the Syrian mountains, yet it is perishable and comparatively valueless with us. And hence it has been inferred that Deodar, however good it may be on the north-western mountains of India, must not be expected to possess any importance with us. There is no doubt, however, that this is merely begging the question. It is not certain that Cedar of Lebanon is of much value when wild; on the contrary, travellers assert that it is no better than coarse Deal; nor has a particle of proof been hitherto produced of its quality being affected by cultivation. The general use of it in ancient days in constructing oriental palaces and temples, if indeed it really was as generally employed as is alleged, might only serve to show that in the interior of buildings, in a very dry climate, where wood has little tendency to decay, Cedar of Lebanon could be advantageously employed. But the name Cedar is believed by the best authorities to have been applied by the ancients just as loosely as it is in our own days, when it is given to such different woods as those of various Junipers, Deodar, Taxodium, and even Cedrela itself. We understand, too, that some of the wood found at Nimroud by Mr. Layard has been ascertained to be Yew. In the next place, it was demonstrated at the meeting in Regent Street that there is no appreciable difference between the quality of Cedar from Lebanon and from Middlesex. The means of proving this were supplied by N. B. Acworth, Esq., of the Hook, near Barnet, who was on Lebanon eight years ago, and who brought thence a part of a limb of one of those remains of the primæval forest which must have been ancient trees in the days of St. Jerome. This gentleman had with great liberality forwarded the specimen, in order that it might form a part of the day's exhibition; and by its side was placed a similar portion of another branch taken from an old tree in the Duke of Devonshire's grounds at Chiswick House. The first was about 80 the second about 40 years old, and it was impossible to point out any difference whatever in their quality, or in the appearance of their sections. It being now, therefore, certain that the quality of the Cedar of Lebanon is in no degree affected by English climate, as has been supposed, we are justified in concluding that neither will Deodar Cedar be so affected.

One of the advantages which planters may look to in the Deodar is the rapidity of its growth. The Indian slab produced on Tuesday, although 4 feet 6 inches in diameter, was not more than 190 years old. Its rate of growth had been somewhat as shown in the following table, as far as could be ascertained from an imperfect uncleaned section:—

Age, as indicated by Concentric Circles.	Diameter.	Increase in Diameter every Ten Years.
Years.	Inches.	Inches.
30	26	—
40	29½	3½
60	35	5½
80	38½	3½
100	42	3½
150	48½	6½
190	54	6

Supposing, then, that Deodar wood grows as fast in England as in the north-west of India, the trees will be fit to fell in 30 years, at which time they would be 26 inches in diameter. According to the tables of Mr. Brown, of Arniston, Larch in Scotland, on favourable soil and site, is only 9½ inches in diameter, on an average, at the same age.

The subject before us cannot be concluded without a word as to the distinction between Cedar of Lebanon and Deodar. A strong belief is entertained by gentlemen whose opinion commands respect, that the one is a mere variety of the other. This point has already been so fully discussed (*Gard. Chron.* pp. 99, 117, 131, 1853) that we need not again go into the argument. But it is important to state that the timber of the Deodar is in one most essential particular distinct from Cedar of Lebanon. The latter is not only soft but very slightly scented, not much more so than some kinds of Deal; on the other hand, the fragrance of Deodar is so powerful that while the workmen were planing it in the meeting room in Regent Street, not only was the house filled with its sweet odour, but the smell was distinctly perceptible in the street when the door was left open. The shavings of it torch and flare with a great flame, but those of the Cedar of Lebanon, whether English or Syrian, burn with no more fierceness than shavings of Pine wood—in fact, they are as dry to the touch; while, on the contrary, those of Deodar are remarkably unctuous. Here, at least, is a great practical distinction, which is of itself sufficient to account for the different quality of the two woods, and strongly indicates a real specific difference. We learn, too, from Mr. Acworth, that the old trees he saw on Lebanon were gnarled like our own old forest trees, while the forests of Deodar which he had visited in India reminded him of a mass of gigantic Larches.

In these remarks we have wished to avoid all speculative questions, confining ourselves to what is not only certain, but has a practical bearing. For ourselves, the only conclusion which we can draw is that the Deodar deserves all that has been reported of it, and has a higher claim upon the attention of the planter for mere profit than any Coniferous tree yet discovered. As a nurse, it will probably ere long entirely supersede the Larch.

Few queries are more frequently made by our correspondents than such as relate to the several galls which occur on the leaves, twigs, or even on the roots of Oak trees, as will be seen in our answers to correspondents, where several of them have been illustrated with figures. Some of these are remarkable for their resemblance to different fungi; and indeed, on superficial examination, have been figured as autonomous vegetables, as, for example, in the "Flora Danica;" while others are very generally known either for their beauty or singularity, as Oak Apples, or for their economical importance, as Nutgalls. These have been made very lately the subject of a particular memoir by Dr. Lacaze-Duthiers in the "Annales des Sciences Naturelles," though not to the complete neglect of such galls as occur on other plants.

In all the kinds of gall examined by this naturalist, several orders of cells succeed each other with a few vessels occasionally intermixed, and with slight variations according to the particular kind of gall, communicating with a stratum of indurated thick-walled strongly punctate cells, and succeeded by a mass of parenchym whose cells are, more or less, richly filled with fecula. In the midst of this soft tissue protected by the hard layer just mentioned, the larva nestles surrounded by the nutriment which is requisite for its transition into the pupa stage, and from thence to the perfect insect.

Dr. Lacaze-Duthiers has not, however, confined his researches to mere structure, but in conjunction with M. Riche, has taken occasion to illustrate the interesting question as to the origin of fat in animals, whether this is formed in the animals themselves, or is merely a deposit from matter taken up with the food. In the solution of this question, it is manifestly necessary to take into account the composition of the whole animal, which is obviously impossible in the case of large animals. Bees have been examined with this view, and clearly indicate the fact, that fatty matters are formed in the animal which do not exist in their food; but no animal could afford better conditions for the solution of the question than the little tenants of galls, which live solely at the expense of a mass of starch and its containing cells, with which they are in immediate contact. The eggs are extremely small when deposited, so that the quantity of fatty matter originally present bears no appreciable proportion to that of the full-grown larvæ, and may safely be neglected, and the whole considered as derived directly or indirectly from the nutriment supplied. The little animals, moreover, are placed under conditions which experience has shown to be most conducive to the deposit of fat in animals raised for the supply of food, viz., complete quietude, abundant nutriment, and isolation from external influences. It is well known that infants fed on starch will grow very fat, though at the expense of muscular development, and the natural inference would be that the fat is secreted in the human frame, since it does not exist in the starch. The analysis of the little larvæ from the galls is completely confirmatory of this view, and opposed to those of Boussingault and others, who from the examination of higher animals, have come to a contrary conclusion.

There are very much stranger matters in physiology than are dreamt of in modern philosophy, and convincing proofs arise daily, indicating how unwise it is to consider organisms, endued with life, as mere chemical laboratories, if we wish to arrive at sound and satisfactory results. *M. J. B.*

VEGETABLE PATHOLOGY.—No. VIII.

21. As in many cases it is requisite that vegetable cells should maintain their peculiar functions in perfect activity for a considerable time, and the tendency of the accession of new layers of matter within the original cell-wall, and the gradual solidification of those already deposited, is to hinder the ingress and egress of fluid matter and the reciprocation between contiguous cells, the additional layers in those parts which rest upon neighbouring cells are very generally perforated with tubular cavities leading to the original cell-wall, or more or less funnel-shaped pits communicating with an orbicular or oblong disc, which corresponds with a similar disc in the neighbouring cell, except in the case of the medullary rays and some other instances. Between the two contiguous discs, there is a peculiar cavity, which in some stages of growth contains fluid.

22. As it is only where the cells are in contact that the layers are perforated, it frequently happens that the two sides of a cell present a very different appearance, the one being perfectly continuous, while the other is perforated.

23. As all plants, even the largest, consist in their very earliest condition of a single cell, the whole of the cells, whatever be their structure, functions, or denominations, are modifications of one form. Such being the case, though it is necessary for the purposes of science to classify the different cells, it is clear that such classification cannot always be very definite, and that doubts must occasionally arise as to the nature of particular modifications.

24. The species of ordinary cellular tissue differ from each other principally in their form being more or less globose or elongated, and the degree or mode of incrassation of their walls. Some plants consist entirely of subglobose tissue, and in some entirely or nearly so of elongated cells. In some moulds and Algæ (*Vaucheria*) the whole plant before fructification consists of a single cell, variously branched and elongated, without any septa, and in *Caulerpa*, where the fruit arises in the protoplasm, however large or complicated the plant may be, and though exhibiting forms which simulate higher productions, but one cell branched and anastomosing in every direction. In general, however, several forms of tissue are combined, and in phænogamous plants, which are more especially in view, these may be reduced to a few principal divisions.

25. The parenchym of which some plants are entirely composed is in all a most important element. The cells vary extremely in size and thickness, their walls being sometimes extremely thin, sometimes, on the contrary, as in the albumen of certain seeds, of considerable thickness, and in such cases their internal coats are traversed by tubular canals, but not communicating with a distinct disc or intercellular cavity. The parenchym secretes those matters which are most important for the purposes of continued nourishment and reproduction, such as gum, starch, chlorophyl, &c., and forms a considerable part of the tissue of the leaves, pith, bark, &c., and is in fact the parent of all organs, however different. Particular names have been given to the different forms which it assumes, but it is not necessary to specify them here.

26. The woody tissue consists of elongated cells, generally ending acutely and sometimes branched, with the walls for the most part highly incrassated, and exhibiting canals communicating with a disc and intercellular cavity. They do not form new cells, and do not contain nutritive matter except in a very early stage of development. A variety of this tissue, which is called woody parenchym, is distinguished by its shorter obtuse cells, and by its containing nutritious matter, and in some cases resin. Both these tissues have a vertical

direction, but in exogens the vertical woody cells are separated by radiating plates consisting of horizontal cells, which are known by the name of the medullary rays. They retain their activity longer than the neighbouring woody cells, and frequently contain nutritive matter. In neither of these forms of tissue are new cells produced. New woody tissue is formed by the division of the external cells only, and in the direction of the bark. What is called cambium is not a distinct tissue, but merely the nascent woody tissue; or, in its most extended sense, includes the younger tissue of the bark. *M. J. B.*

SWAINSONIAS.

The different species of this genus are all well worthy of a place in every greenhouse, producing, as they do, under proper treatment, a profusion of pretty blossoms for some two or three months in succession.

As regards propagation, this is readily effected, either by means of seeds, which are produced in abundance, or by cuttings of the half-ripe wood. The shortest-jointed firmest bits which can be obtained should be selected, and planted in a light sandy, peaty soil, covered with a glass, and placed in a shady part of a cool house for three weeks or so, and then removed to a slight bottom heat, where they will soon emit roots. It will be found however, that the cuttings are impatient of too much damp, hence water should be applied carefully, leaving the glass off until the foliage gets dry, and removing it occasionally, to wipe out damp. As soon as the cuttings are sufficiently rooted to bear handling, pot them singly in 4-inch pots, and place them in a nice moist growing atmosphere, till well established in their pots. Supposing the cuttings to be potted off and established by the end of May, which, if a plant is started early in spring to supply cuttings, may easily be the case, remove them to a cold frame, which can be kept rather close and moist and shaded from the mid-day sun. Attend to watering as may be required, and sprinkle the plants over-head on the afternoons of bright days, shutting up the frame rather early in the afternoon with a moist atmosphere, but give air before night. When the pots are found to be moderately well filled with roots, give a liberal shift, say into 7-inch pots, and water cautiously until the roots get hold of the fresh soil. Tie out the shoots, and stop any over-luxuriant ones, so as to keep the plants dwarf and well furnished, for they are of a somewhat straggling habit, and unless stopping and tying out are persevered in, compact specimens will not be obtained. Expose the plants freely to sunshine and air, after the middle of August, in order to get the wood well ripened before winter, and if this cannot be conveniently done in the frame, remove the plants to a sheltered sunny situation out of doors. During winter they will require merely protection from frost, and a very spare supply of water, provided the wood has been well ripened, and they may be placed in any cold frame where they can be guarded from frost. As soon as they show signs of growth in spring remove them to a close part of the greenhouse, and cut back the shoots rather freely, in order to cause them to break close; and when free growth commences shift into 12-inch pots, and maintain as close and moist an atmosphere as can be conveniently done, until the roots lay hold of the fresh soil. When this is the case the plants will grow vigorously, and will require attention to train the shoots so as to secure handsome specimens. Persevere in bending down strong shoots, and tie them so as to equalise the flow of the sap, and preserve compact specimens. Expose the plants freely to light and air, giving a liberal supply of water at the root, and syringing over-head on the evenings of fine days. By the middle of July the plants should be nice-sized specimens, and covered with blossoms, and they may now be removed to any light airy part of the greenhouse or conservatory, where they will be objects of considerable beauty till late in the autumn. After their beauty for the season is over, cut the shoots back to the well ripened wood, thinning them out pretty severely, and water very sparingly during winter. In spring, when they show indications of growth, turn them out of their pots and reduce the ball, taking care to injure the roots as little as possible, and repot in the same sized pots. By annual disrooting, and a free use of the knife to keep them dwarf, the specimens will last many years. Manure water in a weak state, given two or three times a week, when the pots are full of roots, will be of service.

Good sandy, turfy loam, and rich, fibry peat, broken up into small pieces, adding a liberal quantity of sharp clean sand, and some small lumpy charcoal or potsherds, will be found the most suitable compost in which to grow Swainsonias. *Alpha.*

FORCING SEAKALE.

This plant I need scarcely say is indigenous to many of our sea-shores, where it grows in fine drifted sands, and is sometimes partially covered with small stones and gravel. Few esculents are more improved by cultivation than Seakale. When forced at mid-winter it is far superior to any other vegetable that can be obtained at that season. Possessing such merits it is not astonishing that various methods have been tried to bring it to its uttermost possible perfection. The following will be found a very excellent mode of forcing it, provided the plan is judiciously carried out.

Dig a hole about 3 feet deep, the breadth and width of your intended frame; fill it up with well prepared dung and leaves, upon that place your frame; put in 6 or 8 inches of soil. Then proceed to lay in your roots. With this plan it is necessary to cut away all superfluous large roots, and to leave only such as have buds at their extremity. If each piece having a bud is separated from the rest of the mass of roots, and is 8 or 10 inches in length, it will be found under good management to produce as good a crop as if all the mass of roots was left undisturbed. By thus reducing the roots, a greater number can be got into the frame. And each of these parts will be found to contain sufficient organisable matter to perfect the crop. Lay them in tolerably thick, and cover them up to their crowns with soil; then place your lights on, which will require a thick covering of mats or straw, in order to bleach the Kale; if lights are scarce, wooden shutters will answer the purpose well enough. By this method the roots of course are of no more use after the crop is gathered, therefore sow annually sufficient seed to produce the quantity of plants you require, these will make fine plants for forcing at two years old.

Very good plants may be obtained by taking up old roots, and by dividing them into several pieces, and planting every piece that is from 3 to 6 inches in length; each piece will form a crown, and if this is done in March, these will make very good plants for forcing the following winter; therefore, by sowing a little seed and planting a few roots yearly, a very good supply may be kept for forcing; but I prefer the former plan.

Much of the well doing of Seakale, however, depends upon the treatment it receives during the summer months. If it is allowed to flower and exhaust itself in a useless way, the winter produce must not be expected to be good, for the flower uses up that nutriment which otherwise would have been stored in embryo for the succeeding crop; therefore, let no plants seed, except a few to produce the quantity you require for sowing the following spring. *A. Bundy.*

Home Correspondence.

My Orchard House.—I have now (Feb. 16) finished top-dressing my trees, and have made a station for each pot by taking out two or three shovelsful of the earth from the border, and replacing it with some of the compost used for the top-dressing, and placing the pot upon it so that each potted tree stands upon a little mound; this will soon sink to the level of the border. They have been kept perfectly dry all winter; I shall not give them water till the end of the month. The blossom buds have swelled rapidly lately, so that I have been able to discern the triple buds and prune back to them without any difficulty. Many short shoots or spurs are full of single blossom buds with a terminal leaf bud; some of these spurs I have thinned out, but have not shortened any. And now I cannot help looking over my trees with much pleasure; every shoot is full of promise in the shape of blossom-buds, and no gum or canker is to be seen. My orchard house is a little more than 60 feet by 20, and contains something over 100 trees, placed about 3 feet apart stem from stem. Some of my trees have been six years in pots, and they seem to become more sturdy, healthy, and prolific every year. All this is really very nice and gratifying, and agreeably disappointing; for I remember about three years ago a clever self-sufficient gardener—some are apt to be so till a very mature age—telling me "that it was all nonsense to think of keeping fruit trees in a healthy state in pots." But it seems that in Russia Proper, according to M. Masson's report, all fruit trees are grown in pots and tubs, and "most especially Peach and Apricot trees (were exhibited) of an extraordinary size for plants whose roots were cramped in wooden boxes." Why is it that our nurserymen and gardeners are so prone to condemn, often without trial, any practice or thing at all novel in its character. This should not be, and is much to be regretted. Reverting to orchard houses, I was told when I first commenced operations that my fruit would have no flavour, and that a first-rate gardener, who had filled a house with trees, was ordered by his employer to sell them all, as the fruit they produced was deficient in flavour; but I was firm (what some folks call obstinate) and persevered; I am richly rewarded, for my orchard house is an inexhaustible source of gratification. A near neighbour has a house in which he cultivates from 30 to 40 trees—last season was the second; he gathered nearly 500 fine Peaches and Nectarines, all well ripened, and from the trees on his walls—not a dozen. *Hortulanus.*

Burnt Clay a Material for Walks.—Will you allow me to ask whether any one has employed burnt clay for the purpose of making roads or garden paths, and what is the process of burning it and probable expense per load of 24 bushels? I have heard of it being so employed, and should think where stones are difficult to obtain it might be advantageously used in the construction of roads, &c.[; the expense of stones where I am situated is 9*d.* per load, and 2*s.* 6*d.* the carting them. Being now about to make some length of road and several garden paths, I should feel much obliged to any of your correspondents if they would kindly give me some information on the subject. *A. F. B.* [This kind of material is largely employed in the formation of walks in the park belonging to the new Crystal Palace at Sydenham, where great quantities of clay are burned for the purpose; but we know nothing of the expense attending the process.]

America a Field for Gardeners.—I observed in your columns some time ago that young gardeners imagined they could get plenty of work by going to America. I felt at the time inclined to state that, amongst others from this neighbourhood who have returned to England in disgust, the brother of my gardener went, and he was months before he got a good place, and then had to work long hours. * *Birmingham.*

Broccoli and Corn Salad.—Permit me to ask your counsel in distress about my Broccoli. Under the rude assaults of the snow and frost at the beginning of the year, out of some 300 all but three dozen have perished. Of some the heart rotted out; others rotted through the stalk, about half-way up. As to their situation in the garden, it is neither much exposed nor specially protected; and my soil is heavy clay, well drained. What would you advise in the case? whether for the preservation this season of the few survivors, for which the return to-day of severe weather makes me tremble, or as a safeguard for future years? [Endeavour to procure hardy sorts.] I never have so suffered before all the 12 years I have been in this district. Have you, from other quarters, similar complaints this year? [More than in any year since 1838.] In Belgium, some years ago, in the month of April, I met with, in the hotels, a very nice salad made of what they designated to me as Corn Salad plant. I should like to grow it if I knew anything about it. Please instruct me as to its cultivation; *i. e.*, when should the seed be sown, whether in ground richly manured; and if the plants are afterwards to be transplanted; and at what age is it ready for use? *Olitor.* [Sow in rich garden soil, broadcast, or in drills 9 inches apart, at any time; but chiefly at intervals from the end of August till the end of October. The leaves are used when nearly full grown, but still tender.]

Storing Apples in dry Sawdust.—I have a dark closet in my house, or rather I live in a row with windows back and front. The house is four stories high, and the length from front to back is so great, that we have three rooms on a floor, the centre one dark. On the third story the floors are plaster, and I find the temperature so even that I use it for a wine store in preference to the cellar, and have it fitted with binns. In this room I put some hampers of Apples (like Pearmain). I wanted one of the hampers, and turned the Apples on one of the binns, amongst the dry sawdust (Pine sawdust). A fortnight ago we looked at them, having used up the others gathered at the same time and from the same tree, all of which were much wrinkled, but on taking those off and from amongst the sawdust, I found them in a most beautiful condition; those covered with sawdust were as plump and fresh as when gathered, while those partially buried were only so to the extent covered with the sawdust, the upper portions being wrinkled. I am so pleased with the discovery that I shall pack them in binns next year, for I have no doubt they will keep in this way until next Christmas. *Anon.*

Cost of Garden Walls.—If Mr. Daniels will consider the difference in the price of both materials and labour in 1852 and 1854, and if he will also allow for labour, at London prices, as compared with Sussex, he will find that my calculations, for using the best materials and the best workmanship, are not much beyond the mark. At the present time the materials alone could not be purchased for the sum he quotes, in this neighbourhood. *W. P. Ayres, Blackheath.*

The Manetti Rose Stock.—"This Rose stock is condemned." I read this (see p. 102), with some surprise, but it appears to be the sentence passed on it by Mr. W. Paul. I am very glad, however to be able to raise my voice in its favour; for, happening to live in a district where sand is predominant, I was at my wits' end to grow my favourite—the Rose, until some 10 or 12 years ago I received this stock. Roses budded on the Dog Rose would not grow. In two years at most they were all dead and dying. Now, to my great delight, my Hybrid Perpetuals, in particular, seem not to know when to leave off growing and blooming, and one of my neighbours, who has just enclosed a piece of ground from the heathy waste of Surrey, is in like manner delighted with his success in the cultivation of Roses budded on this stock. I have seen it growing with the same success in the sandy districts of Kent, Sussex, and Hampshire; and in the north I remember seeing Roses growing with remarkable vigour at Darlington, which were stated to be budded on this stock, so that it seems to me to be very valuable for light soils. I have never seen it at Mr. Paul's nursery, so I presume his soil is too deep and rich for it. Nevertheless, in my opinion, it is a very valuable stock. *An Old Rose Amateur.*

Cheap Fuel.—In connection with food, firing is, of course, a first consideration. Now, at every pit's mouth, breeze or small coal is to be had for nothing, or very little; if this were mixed with clay, as is done in Wales, it would, of course, make it go much further. I cannot see why (where a clay "pug" is to be had) saw-dust and clay, barky refuse and clay, or coarse litter and clay, should not be much used; the coals and clay do not, however, require a "pug," being mixed in Wales with a shovel. *Somerset*, 1, *Hyde Park Street.*

Orchard Houses.—I am obliged by Mr. Duncan's corrections. It appears that I had mistaken the length of rafter for width of building, but at the same time I must remark that my calculations of cost and produce were calculated for a promenade such as I should build, and which even at the present time could be erected for what I have stated. In Mr. Duncan's case he has covered very elegantly and substantially a garden wall; my calculations are for a promenade, without a wall at all. *W. P. Ayres, Blackheath.*

Railways.—I beg to call attention to the necessity of having some legislative measure prepared to compel

railway companies to forward perishable plants as quickly as possible; and whilst baskets containing stove and greenhouse plants are under their charge, to keep them under cover, also when on their journey to protect them from the frost by coverings, &c. It would surprise the public to hear of the immense losses sustained by individuals, and the great injury done to trade generally by the delays and destruction of plants, which might be prevented with common prudence and care. *A Nurseryman.* [Why don't you bring an action against the directors ?]

Woods and Plantations.—In your paper of the 14th of January there appeared an article headed "Advantage of Draining Woodlands before Planting," in which the writer, "W. R. A.," constituting himself an instructor of foresters, states a few very good reasons in support of his text, and immediately digresses from the all-important subject in hand, which forms what he very appropriately terms "the keystone of future success," in all "arboricultural operations," to the advantages attendant on the use of small sized trees, and the preference due to the Larch as a nurse for Oak. From a perusal of this article, as well as that which followed it (see p. 70), it is evident "W. R. A." has got the idea into his head that foresters are a profoundly ignorant class—ignorant of the most common-place and self-evident facts; and that they will swallow anything or everything that anybody professing to write for their improvement may be pleased to place before them. I shall not venture to say that "W. R. A.'s" abilities are unequal to the task he has undertaken; at the same time, judging from the two articles in question, I must confess that, if he is equal to the task, their ignorance is assuredly notorious, and that "as ignorant as a forester" may with propriety be added to the adages of our country. "Thirty years ago it was," he says, "thought sufficient to drain only the decidedly wet portions of land at about 50 feet apart," whereas, so far as I have observed, the fallacy of "that time" did not consist so much in the distance apart, as in the dimensions and direction of the drains—often being as close as 12 feet, and not above as many inches in depth and width. To remedy the defect of "that time," "W. R. A." "would urge on all foresters" the "necessity for thorough drainage at about 25 feet apart, and 30 inches deep;" but, seeing that he anticipates his readers to be so devoid of common sense as to require to be told they must have "a proper outlet" for their drain, I think he ought to have given, at least, a hint as to the requirements of the different soils with respect to the depth, the distance apart, and the direction of the drains—for he acknowledges that efficiency in this department "forms the keystone of future success;" and there is no doubt that, as there is a difference in soil, so also should there be a corresponding difference in the distance and depth of drains. As to planting, it is true that Oaks 2½ or 3 feet high, on exposed situations are not so apt to suffer from high winds as those of 5 feet; still I cannot agree with him that "it is a long time before they (the 5 feet ones) begin to grow, and that they never afterwards make such vigorous growths as they formerly did:" who that has had the management of forest trees in a nursery has not observed, on the same quarter, plants 5 feet high, and perhaps the very next plant not more than 18 inches; and I would ask any practical man whether he would not prefer those 5 feet high—that height evidently being the result of a more vigorous state of health—every organ being in the best possible condition for the change, and for enabling the tree to adapt itself perfectly to its new site. Let me not be misunderstood; I am no advocate for tall trees, but the contrary; what I mean to assert is that some other criterion than height—age—is necessary to guide inexperienced persons in the selection of their plants, so as to secure "a future healthy crop" rather than "a sickly and unpromising one." In his second article "W. R. A." proceeds with his instructions, stating that "next in order to drainage and selection of plants," and of course getting them to the spot, "comes planting." What an original idea!—showing in what estimation he holds the intelligence of foresters, and the meagre opinion he has of their judgment. I shall not question that the "best method of planting Oak and Larch on sheltered situations is to have them put in at 4 feet over all;" but how this is to be done after the Oaks have been put in at 10 feet I cannot comprehend; for who cannot perceive that 10 is no multiple of 4; even the labourer with spade in hand would find the execution of the work at more distance an impossibility. I admit the propriety of making pits in all cases for Oak, on account of their generally having large roots; but, attaching as your correspondent does so much importance to the size of trees, it is a very vague mode of stating a fact to say, with reference to the nurses, that "when the plants are small" they may "be put in with what are termed notches;" and that, "when they are comparatively large, pits are necessary." "W. R. A." is doubtless aware that it is the custom in many parts of our island to plant no Larches permanently till they have been transplanted three or four years in the public nursery, and are from 3 to to 5 feet in height, while in other parts they would be considered large enough after standing one, or at most, two years in nursery lines, and not more than 2 feet high. From this it is clear that the small trees of one district will be the large ones of the other, and that inexperienced planters (unhappily a too numerous class) in their respective localities, who might be inclined to follow the advice of "W. R. A.," would, from his mis-stated fact, misapply the practice he recommends. As I have never seen the instrument invented for the "notching system," I cannot speak decidedly as to its merits; but from the explanation given, I could imagine it to be a very efficient tool on level, clean, Grass land, but on stony, hilly, or on that sort of land which prevails on many of our hills, I think it must be disadvantageous rather than otherwise. Though the mismanagement of the Woods and Forests of the Crown, and the inexperience of the surveyors exemplified by the "deaths" and "failures" on "210 acres" planted in the New Forest in 1852, are notorious, almost proverbial, yet I opine that "W. R. A.'s" remarks upon them will neither tend to their improvement nor merited exposure. I can agree with him in condemning their system of planting alternate rows of Oak and Scotch Pine as a practice "wholly contrary to the attainment of beneficial results," but not on the ground that no "thinning can be done to perfection, as their future health demands;" for grant that the future health of wood demands the execution of this operation in perfection, and we soon arrive at the conclusion, that the want of this corner-stone is the grand cause of the unhealthy aspect of so many of them. Relative to his criticisms on the Woods and Forests, I would ask "W. R. A." one question, viz.:—How the removal "of every other Oak and Scotch Pine" can be done with a hope of, or "view to their future health" seeing that to attain this desirable object the "thinning must be done in perfection" and "with regularity" in woodlands, when the disposition of the plants over the ground is "wholly contrary to the attainment of beneficial results?" I shall postpone further strictures on "Planting Woods," in the hope that the writer will, in his next article, improve his position, show himself worthy the confidence of a discerning public, and deserving the thanks of those for whose benefit he writes; in fact I would not have entered upon the subject at all but to protest against the assumed ignorance of foresters, and at the same time advise "W. R. A." that unless he has confidence in his own ability to instruct he would do well not to occupy the pages of your Paper with valueless matter, but leave an open field for men like Mr. Bailey, whose "No. 1" on "Woods and Plantations" is, we have reason to hope, the beginning of a series which will prove "strong drink for men and milk for babes." A few articles like that just mentioned would edify he young, and interest, if they did not instruct, the old; but your correspondent's remarks are not calculated to do either the one or he other. *J.*

Societies.

Horticultural, *Feb.* 21.—Dr. Royle, Secretary, in the chair. S. Dickenson, H. Pouncey, and W. Wilson, Esqrs., were elected Fellows. The great interest belonging to several of the subjects exhibited on this occasion drew together an unusually large number of Fellows and their friends. Of Pears there was a very fine collection from Mr. Snow, gr. to Earl de Grey at Wrest Park, Beds, consisting of Chaumontel, Easter Beurré, Beurré Rance, Glout Morceau, Old Colmar, and Ne Plus Meuris. These were all perfectly sound, and in every way as fine specimens as could possibly have been ripened even in the best of seasons. A Banksian Medal was awarded.—J. Abell, Esq., sent from Limerick examples of Easter Beurré, Beurré Rance, Spring Beurré, Fortunée Parmentier, both from Pear and Quince stocks; Susette de Bavay, Rouse Lench, Crassane d'Hiver Brunneau, Catillac, and some Royal Russet Apples; the latter, though not very fine specimens, were in good condition, but the Pears had begun to spoil.—Some very fine Pears of foreign growth were furnished by Mr. Lewis Solomon, of Covent Garden. They consisted of Easter Beurré, Belle Angevine, St. Germain, Winter Nelis, Passe Colmar, and Bon Chrétien; and along with them were the following kinds of Apples, viz., the White Calville, Reinette du Canada, and the pretty little Lady Apple, or Pomme d'Api of the French. These were all beautiful fruit, more especially the two first named Apples, which possessed a transparency and brightness of colour such as they never attain in the climate of Britain. Of foreign vegetables, the same exhibitor produced some very fine white Asparagus and "green sprew," French Beans, very good Early Horn Carrots, Globe Artichokes, large white Cauliflowers, and young Spinach. A Banksian Medal was awarded for the vegetables, and Mr. Solomon also received another medal of the same kind, for the following salad vegetables of French growth, viz., Cos and Cabbage Lettuces, Batavian and curled Endive, Radishes, Taragon, and Chervil—all fresh and in excellent condition.—From Mr. Freeman, gr. to W. O. Hunt, Esq., came Royal Nonpareil, Hunt's William Shakspeare, and Hunt's Duke of Gloucester Apples. Of these, the latter very much resembled the Sturmer Pippin. Of other fruit, Mr. Ingram sent from the Royal Gardens, Frogmore, two beautifully grown specimens of smooth-leaved Cayenne Pine-apples, forming perfect cones in shape, and weighing respectively 6 lbs. 4 oz. These were stated to have been ripened on suckers planted on a bed of leaves last March. It was mentioned that this kind of Pine-apple is a much more valuable sort for winter use than the Enville. A Banksian Medal was awarded.—Of Grapes, Mr. Butcher furnished bunches of Black Barbarossa, so plump and sound as to be easily mistaken for new Grapes. One point of the greatest importance connected with this variety is that it will hang longer in a ripe state without shrivelling than any other black Grape with which we are acquainted, West's St. Peter's not excepted. A Certificate of Merit was awarded.—Of Plants, Messrs. Veitch showed a new Cypripedium from Moulmein, for which a Knightian Medal was awarded. In some respects it resembled the common C. insigne; but it was, nevertheless, materially different from that species, and altogether much handsomer.—From Messrs. Jackson, of Kingston, came Barkeria elegans and Skinneri, both remarkable, but more especially the latter, for the length of time they continue in bloom.—Messrs. Lee furnished a new and very handsome species of Vallota, which certainly must be regarded as a very great acquisition. The plant just exhibited had a flower-scape about a foot high, crowned with numerous vermilion flowers, in form like those of Vallota purpurea. A Banksian Medal was awarded.—Of Cyclamens there was an interesting group from Messrs. E. G. Henderson, of Wellington Road. They were essentially all varieties of C. persicum, but they differed very much from that species in colour, varying as they did from deep purple to pure white. A Banksian Medal was awarded.—Mr. Atkins, of Painswick, Gloucestershire, produced two large masses of a very dwarf, pale-coloured hybrid called Cyclamen Atkinsi. It was stated to have been the result of crossing C. coum with persicum. It is certainly a most profuse flowerer, and very pretty. The specimens shown were reported to have been bloomed in a cold frame where they were frozen hard during the late storm; but from which they apparently sustained no injury; for they were said to push and grow vigorously as soon as the weather had become milder. Of seedlings raised, it may be mentioned that about two-thirds had the pale lilac flowers of C. Atkinsi, whilst the remainder had the dark purple blossoms of coum. A Certificate of Merit was awarded.—From Mr. Buck came a well bloomed specimen in a small pot of Cyclamen persicum.—From the garden of the Society came a very showy striped Crocus called Sir Walter Scott, the handsome scarlet Thyrsacanthus rutilans, a very free flowering hybrid Begonia raised between B. manicata and B. hydrocotylifolia, and a variety of the lilac Azalea squamata, which was stated to differ in several respects from the race of Indian Azaleas now in cultivation; with one or two other plants.—Of vegetables, the garden furnished Laitue Romaine Verte Maraîchère, the sort of Cos Lettuce grown by the French in winter; Laitue Chou de Naples, one of the sorts of Lettuces distributed by the Society, and which is esteemed the best Cabbage Lettuce in cultivation; Marshall's Black Spine Cucumber, which answers well for early forcing, requiring plenty of heat; Persil à grosses racines, a kind of Parsley, whose long Carrot-shaped roots are cooked; it resembles the Hamburgh Parsley, but differs in the leaves, which are more curled than those of the Hamburgh, or broad-leaved. The flavour of Parsley can be obtained from this just as that of Celery is from the roots of Celeriac, in climates and under circumstances where the stalks and leaves could not exist. The plants are easily grown, and the roots might form part of the vegetable stores of shipping.

In adverting to subjects of a different kind, the Vice-Secretary observed that a great deal of interest had lately been excited respecting the Deodar and the Cedar of Lebanon, and the quality of their timber. No one had ever yet seen Deodar timber produced in this country, and therefore it was uncertain whether it would have the qualities ascribed to it in India, or remain merely as a tree of very great beauty, but of very little use. With a view to extend a knowledge of the real quality of the Deodar wood, the East India Company had caused some enormous planks of it to be imported, one of which was placed in the room for the inspection of the meeting.

Dr. Royle, referring to the magnificent specimen just alluded to, stated its dimensions to be about 4 feet 6 ins. in diameter, and 18 feet in length. Much interest, he observed, had lately been felt, and much inquiry raised about the quality of this kind of timber. He would endeavour, from his own knowledge of the native country of the tree, to answer this inquiry. The Deodar grows at an elevation of from 5000 to 12,000 feet, in a climate very changeable and often very cold. The natives of the Himalayas, he said, have a great variety of timber to choose from, but they invariably prefer the Deodar for all purposes. The Himalaya climate is very variable from March to June, and very fine and dry from the middle of June to the middle of September. The winter is very cold, and the mountains are for a considerable time covered with snow; so that there is as much variety as in a northern climate. If Deodar wood, he remarked, was used only in covered places, there would be no test of its durability, but it is used in the construction of temples, houses, and bridges, in damp and exposed situations; and by the peculiar mode of building adopted, it is as much exposed to the action of the weather as the stone which it is employed as an outside framework to support; and some of these erections have stood for centuries. It had been doubted whether the timber would be as good in this climate as in that of India; it was his (Dr. Royle's) opinion that it would. On this subject he read a letter from Mr. Wilson Saunders, of Lloyds, confirming his belief. That gentleman had examined the timber along with two other experienced gentlemen, who coincided with him in giving a favourable report. Mr. Saunders had no hesitation in stating that it appeared to be superior to American Larch, or any other coniferous tree, and would be very useful for naval purposes. But if only as useful as the Larch and its allies, it must still be considered an article of great value. As a proof of the estimation in which American Larch is held, he mentioned that 20,000 tons of shipping are now building in North America of that wood alone. The Larch may be considered as intermediate between the hard woods and the soft woods, and he thought the Deodar should rank higher than the Larch. Dr. Royle thought this testimony highly satisfactory. As it regarded the question whether the timber would be equally good grown in this country as in India, he said an argument to the contrary had been based on the fact, that while great excellence was always accorded in ancient times to the wood of the Cedar of Lebanon, that wood appeared, as grown in England, to be destitute of such good qualities. The argument is founded, however, on an error, inasmuch as ancient descriptions of the excellence of Cedar wood did not necessarily refer to the Cedar of Lebanon, but might have been applied to Junipers and other trees. The conditions essential to the growth of the Deodar in this country, he remarked, are free drainage, free ventilation, a low temperature, and considerable moisture. The mechanical condition of the soil did not appear to be very essential, but along with free drainage, a slow supply of nutriment is necessary to prevent the tree growing too rapidly. He considered that the Deodar was a valuable addition to our timber trees, and that every encouragement should be given to its culture in situations adapted to it.

Some observations were made by the Vice-Secretary on the recent statements that the Deodar and Cedar of Lebanon are the same species, as well as on the arguments against the goodness of Deodar wood grown in England, founded on the alleged fact that the Cedar of Lebanon wood grown in England is inferior to what it is in its native climate.

The attention of the meeting was next directed to representations of Wellingtonia gigantea (see p. 819, 1853), from Messrs. Veitch, and to portions of bark and wood, and a cone of that gigantic tree, which were also supplied by the same eminent firm. The cone was very small for a tree of the dimensions of the Wellingtonia, being scarcely larger than a hen's egg, and bearing considerable resemblance to that of a Cupressus. The wood was clean, light, and the colour of Red Cedar.

Roots illustrative of the effects of lifting large trees by Mr. M'Glashen's machine were again exhibited. They belonged to a Sycamore, more than 50 feet high, which had been transplanted by this contrivance at Cramond House, near Edinburgh. It was stated that, on care-

fully removing the earth from one side of the old ball, the cut roots were found to have thrown out a mass of young fibres fully equal to the task of supplying the demands made on them by the top. Thus it is finally shown that large trees, as well as small ones, may be safely lifted by this machine.

The following cuttings of fruit trees were distributed to Fellows, viz. :—Cerise Reine Hortense, a juicy, sweet Cherry, whose synonyms are Cerise Monstrueuse de Bavay, Hybride ou Belle de Lacken, Louis XVIII., Morestru, Rouvroy, Guigne de Petit Brie, and Reine des Cerises. Donna Maria, said to be a large Cherry, of first-rate quality, ripening in Belgium, in the end of July. Bigarreau d'Octobre : fruit not large, but very late ; it is the latest sweet Cherry. Josephine de Malines Pear : middle sized, turbinate, brownish red next the sun. Flesh melting, buttery and sugary, with a flavour somewhat resembling that of the Passe Colmar. Ripens, January—March. A valuable late Pear.

Notices of Books.

Des Substances Alimentaires, &c. (on the Varieties of Food ; and the Methods of Improving and Preserving it, or Recognising the Changes it Undergoes.) By A. Payen. 12mo. Paris : Hachette. Pp. 403. Bibl. des Chemins de Fer.

A more experienced man than M. Payen, or one who to high scientific rank adds more sound practical knowledge of subjects of this kind, is not to be found in the brilliant corps of modern chemists. We therefore, knowing for how long a time the properties of food have been his especial study, opened the little volume before us in full expectation of finding in it all that sound science can say with certainty upon this all important subject ; nor have we been disappointed. Brevity was a necessary condition in providing a railway book ; but perspicuous arrangement, methodical treatment, and the power of condensing without reducing facts to a bundle of dry bones, has enabled the author to prepare one of those little manuals which the world infinitely, and wisely, prefers to formal learned disquisitions.

M. Payen includes within his limit the general principles to be taken as guides to wholesome or unwholesome feeding, and thence proceeds in a logical sequence to consider their application to meats of all kinds, under all the varied forms in which such food is presented to the cook ; then follow chapters on skin, tendons, milk, eggs, and caviare ; butter, lard, oil, and other fatty matters ; sugar and honey ; farinaceous substances, such as arrowroot, tapioca, sago, and all the varieties of flour ; rice, maize, potatoes, and the races of leguminous seeds ; bread and its many peculiar forms, not forgetting the frauds of bakers ; fruits ; esculent vegetables ; chocolate, coffee and tea ; wine, cider, beer, and spirits ; the series being finally closed by an exposure of some of the quackeries which simple people are persuaded to accept as substitutes for cheaper food.

M. Payen strongly insists upon the absolute necessity of a varied diet, if man is to enjoy good health ; he regards meat, fruit, vegetables, and the wholesome forms of fermented liquors to be essential, in due proportion, to maintain animal force ; and therefore he is by no means a friend to vegetarian habits. It is England, he says, a country whose eccentricities are universally known, and whose civilisation, of a high order, moves in almost all directions attended by a train of barbarisms —it is this England which has produced a numerous sect, excluding animal food from the diet of man, and even succeeding in making converts to such a doctrine. These good people are unable to perceive the final tendency of their faith and practice. They cannot see that if the world were of their mind, many species of animals would cease to be reared, especially those which are carnivorous, and that this must tend directly to the extinction of breeds, to say nothing of the gradual reduction of the strength of man, and the consequent degeneracy of his species. Such a revolt against all laws, divine and natural, could only lead to the ruin of the human race. M. Payen, however, does us the justice to admit that he does not think such absurdities likely to lead to much mischief in Great Britain, or to make us other than what we are, the greatest consumers of meat in the world.

It is a capital book, and should be immediately translated ; but it requires to be rendered into English by a man of science, not by a mere linguist. We therefore rejoice to see that the French publishers have done their best to secure that object, by reserving the right of translation to themselves.

Black's Library Edition of the Waverley Novels has reached the 22d volume, and continues to deserve the commendation which we bestowed upon the commencement of this beautiful issue.

New Plants.

47. Vallota ? miniata.

V. tubo brevissimo, laciniis perianthii sepalinis angustioribus et paulò brevioribus, staminibus subdeclinatis.

A beautiful greenhouse bulbous plant, with fleshy narrow pale green leaves, resembling those of Clivia (*Imatophyllum*), and the inflorescence of Vallota purpurea, from which it differs in the flowers being much smaller, of a clear delicate brilliant vermilion colour, passing into Indian yellow in their lower half, and in the tube not exceeding 4 lines in length. The sepaline divisions of the perianth are about one-third narrower, and slightly shorter than the others. The stamens are somewhat declinate, and nearly as long as the perianth, in which respect this differs from the previously known species of Vallota, as it also does in the want of a membrane connecting the segments for full half their length. The ovules are six, attached to the axis of each cell. These circumstances would perhaps justify the creation of a new genus ; but in the absence of information concerning the fruit, and considering moreover the great resemblance of the plant in habit to Vallota, it seems better to leave it for the present in that genus. Messrs. Lee received a Banksian Medal for a specimen of it exhibited on the 21st inst. to the Horticultural Society, and it richly deserved that mark of value. It was purchased some years ago from Messrs. Backhouse, of York, who are said to have received its bulbs from Caffraria.

Garden Memoranda.

Messrs. Veitch's Nursery, King's Road, Chelsea. —Several important alterations have been effected here since our last visit. The show house at the entrance has been entirely remodelled. The dead flat roof with which it was previously covered has been removed, and in its stead a neat triple span of glass has been erected, supported by trellised uprights, to which are to be added wire arches for tender climbers. On either side of the centre walk is a low stage for flowering plants, among which we remarked Ghent and Indian Azaleas, the pretty little Deutzia gracilis, Chinese Primulas, and the beautiful little Himalayan P. denticulata, which, although perfectly hardy, makes an interesting greenhouse plant at this season of the year ; together with various Hyacinths and some well flowered specimens of the showy Rhododendron Nobleanum. It may be mentioned that this is one of the best of all the Rhododendrons for purposes of early decoration, as it requires very little heat to bring it into flower, and then it lasts a long time in beauty. The flowers on the plants we noticed here varied from crimson to a pale pink, according to the rate at which they had been forced into bloom ; those brought forward most slowly being the deepest coloured. For the stone platforms which were wont to run up either side of this house, for plants to stand on, beds of earth have been substituted, in which are planted large Camellias, with a view to cover the back walls, and in front of them are various Araucarias, fine plants of Libocedrus Doniana, and Chilensis ; Fitz-Roya patagonica, and Saxe-Gothæa conspicua, both of which have been found to stand the severe frost of last winter in some places uninjured ; Dracæna indivisa, Berberis Nepalensis, and other plants, forming altogether an extremely interesting and agreeable glass covered promenade, of some 70 feet in length, which it is intended to keep gay with flowering plants both winter and summer. The adjoining central house has been cleared of the tall plants of different kinds, which it contained, and is now occupied with Aphelexis, specimen Azaleas, which are well set with bloom buds, and numerous very fine standard and pyramidal Portugal Laurels, which of late years have been so much sought after as a substitute for Orange trees. The new beds in the small open square here, surrounded by the glass houses, are finished and ready to receive the American plants, with which they are soon to be planted. The two long houses on the east and west sides of this square have been new roofed and heated with hot water in 4-inch iron pipes. Both are filled with Orchids, which are kept here in three different houses, viz., the East Indian, South American, and show-houses. In the latter compartment are brought together all plants in flower, which are kept in a temperature sufficiently cool to enable visitors to inspect them without inconvenience. Among others which were blooming nicely here, at present, was a recently imported plant of Saccolabium Blumei, with no fewer than 20 spikes of flower on it. A compartment at the other side of the square just alluded to is filled with Pitcher-plants, of which, we need scarcely say, Messrs. Veitch have a very fine collection, and we must not forget to mention the beautiful species of Anæctochilus which occupied an end of one of the Orchid-houses. They comprised fine specimens of all the kinds in cultivation. In the stove were examples of Medinilla, Rhodoleia, Hexacentris, Ixoras, and Hoyas ; but of plants in flower by far the most striking was Conoclinium ianthemum, which is found to be extremely useful for winter and early spring decoration. In what is called the New Holland house were some well grown specimens, among which we remarked the charming Jasmine-flowered Rhododendron, Pleroma elegans, Tropæolums, the beautiful Veronica variegata which was exhibited at Chiswick in June last, various Epacrises, Erios emons, and Boronias, together with a fine stock of Lilium giganteum, and other interesting plants, among which must not be forgotten the new and beautiful Philesia buxifolia. In the stove aquarium, on either side of whose entrance is to be formed a bed of Yuccas intermixed with the handsome Dracæna indivisa, we observed, standing over the water, a fine example of the tree Fern Dicksonia squarrosa, and several other plants of a striking character, so arranged as to give a varied and good effect to the house. The tank is well stocked with Nymphæas, among which were numbers of N. Devoniana and preparations are being made in it for the reception, of the Victoria regia. In the propagating house were several seedling plants of Wellingtonia gigantea, the enormous Californian tree which is now everywhere occupying so much attention, and also an example of the Rice-paper plant from China. Out of doors, a broad border the whole length of the grounds has been planted with specimen Conifers ; new walls have been put up, to block out from view the packing sheds and other unsightly objects ; and altogether this nursery has of late been very greatly improved.

FLORICULTURE.

Specimen Calceolarias.—In order to grow large specimens, when the plants are done blooming and cut down, place them in any sheltered situation out of doors, and water sparingly. About the end of August, turn them out of the pots, and shake away all the old soil from their roots. Prune and regulate these a little, and repot in as small pots as can conveniently be done, in a light, rich soil. Place them in a close, warm situation afterwards, admitting air by degrees, as they begin to grow. When taken into the greenhouse, let them have a situation near the glass ; they will keep growing less or more all winter, and if the pots fill with roots, give them a shift to keep them on, and, about the middle of February, give them a final shift into the flowering pots, in a compost of two parts good, turfy loam, one of leaf-mould, and one of well-rotted dung ; to this add another part of sand and broken charcoal. These must be well mixed, but not made fine, for the roots delight to ramify in rough, lumpy material. Use 9-inch pots for large plants ; these must be perfectly clean, and properly drained ; pick off a leaf or two from the neck of the plant, and keep it well down in the pot ; make the soil moderately firm, and leave plenty of room for supplying water to the plant ; keep them near the light, and draw a syringeful or two of water over them occasionally ; this will keep them fresh and clean ; and, by having the surface of the soil always a little moist, they will grow vigorously and send numerous roots out of the sides of the stem, and from underneath the leaves ; at the same time, see that the mass of soil does not get too dry, for, although the surface of the earth may be thus kept moist, the interior part may be quite dry, and the plants consequently receive a check. A practised ear will know when a plant requires water by giving a rap on the pot. As the flower-stems lengthen, gradually widen and arrange them, so as to allow full benefit of light and air, keeping them in place, by tying neatly to small stakes. While in flower, they must be kept shaded, cool, and airy. The dry weather of May and June will soon rob them of their beauty, if attention is not paid to shading from bright sun, and the atmosphere kept moist by now and then watering the paths, under the stages, and all vacant places ; if this is properly attended to, they will flower for six or eight weeks in the warmest of seasons, and display beautiful masses of their variously mottled, purse-like flowers. Plants intended for hybridising should be placed by themselves ; any two flowers of different colours, when crossed, will produce innumerable intermediate varieties. With a small piece of wood, sharpened thin, scrape the pollen from the anther of the one, and apply it to the stigma of the other ; and, when several crosses are effected on one plant, distinguish them by threads of different colours, carefully noting down the same, so that there may be no confusion when the seed is ripe. Assist the plants with frequent waterings of liquid manure, while the seed is ripening ; this will ensure fine, plump seed, and gather it before the pods are fully ripe, as they are then liable to burst, and the seeds to disperse. *S.*

Pelargoniums for Exhibition.—As specimens for exhibition in some respects require different management from small plants for the home stage, inasmuch as they must be had in bloom at a given time, I take this opportunity of recording the proper course of treatment to ensure a good head of bloom in May. To manage this nicely requires some forethought and experience. In addition to a judicious selection of plants for early work, they should have had their last shift not later than the beginning of October ; and by the present time the pots should be becoming full of roots, and the plants have made strong growth. They will now require encouragement, by putting on a little fire early in the afternoon, just sufficient to raise the temperature of the house ; when warm, syringe the flues if the weather is open. The steam excites the plants to make growth. Increase this as the season advances. Tie out the shoots singly, so as to admit light and air to every part of the plant. Water more freely ; but care must be observed not to make them too wet, and so induce a weak, sappy growth ; give air on all possible opportunities, but avoid cold draughts. The general stock and specimen plants intended to flower in June and July should not be excited at present ; they should have received their final shift, and should be growing gently on ; use heat only on special occasions, as, for instance, to exclude frost and dry the house, giving air at the same time. These plants may now be tied into shape, as the old wood, as well as young, can at this stage be twisted with less danger than later in the season, when t is full of sap. As I have already stated, great care must be taken not to water too freely, as it is not quick growth that is wanted, so much as short strong shoots, which will ensure fine flowers, as well as a good head of bloom. *W.*

Carnations : *F.* The soil which some of the best florists use for these flowers is the top spit of a meadow taken off long before it is wanted, and frequently turned, in order to clear it of wireworms : it is by no means heavy soil ; the only addition it receives is about one barrowful of good decayed stable-manure to three of loam. Sufficient material for the following year

is mixed every August, and, as we have stated, the loam is always in store some time before it is wanted. Rather a plentiful supply of weak manure is given the plants during June, if the weather is hot, with a view to assist them in throwing up their blossom-shoots.

Miscellaneous.

Flowering of Mammillaria senilis.—The specimen of Mammillaria senilis which produced four flowers last year and which has again flowered, is nearly round in form, $4\frac{3}{10}$ inches high, and about the same in diameter. It has three hooked inner spines, $\frac{8}{10}$ of an inch in length. The flower springs from between the bosses, at about an inch from the centre of the plant. Tube, 1 inch in height, $\frac{4}{10}$ in breadth at the base, and $\frac{6}{10}$ at its other extremity, of a beautiful satin-like appearance, orange red, and formed of imbricated sepals. Petals spreading, 14 in number, forming a surface about $2\frac{3}{10}$ inches in diameter; they are inserted at right angles with the axis of the tube, are narrower at the base than at the top (width $\frac{2}{10}$ to $\frac{3}{10}$ of an inch), distinctly denticulate, orange-red, like the Phyllocactus Ackermani, marked along the middle with a dark red line, margin nearly transparent. Filaments extremely numerous, strong, white, or somewhat orange, extending about three-fourths of an inch beyond the tube; anthers as well as pollen of a dingy orange. Style slightly exceeding the length of the stamens, and terminating in a stigma having six rather deep divisions, but which do not open. The flower lasts about seven days; it opened on the 8th of May, and withered on the 15th of that month. It remains always open, contrary to the habit of nearly all the flowers of Mammillariæ and Echinocacti. *Schlumberger, in Revue Horticole.*

Hardy Aroideæ.—The following list may be useful to those who wish to cultivate these curious things. All the species here enumerated are procurable; but several are more likely to be had in South of Europe gardens than in our own:—Arum maculatum, italicum, do. variegatum, corsicum, Dracunculus, crinitum, Dracontium, triphyllum, do. zebrinum, virginicum, Arisarum, proboscideum, tenuifolium; Calla palustris, æthiopica; Pothos fœtida; Ambrosinia Bassi, reticulata, maculata; Rohdea japonica; Houttuynia cordifolia.

Pyrola rotundifolia.—Abundant evidence was still visible of the ruin occasioned by the storm of the previous day in the loose earth, broken fragments of rocks that were scattered around, and in the marks of terrible concussions that had taken place between the projecting rocks and the larger fragments in their descent, the point of contact being surrounded by a stratum of smoke-like dust, where the smell of fire was still apparent. I had penetrated to a considerable distance among the cliffs near the summit, at a place where one of the masses had descended, breaking off pieces of rock and tearing up and grinding the vegetation in its progress. I had just pulled myself up and secured my footing on a green shelf, which had been partly torn from its moorings on the rock; on getting hold of the shelf above and raising myself upon it, my astonishment and delight may be better conceived than expressed, on perceiving the whole shelf covered with a dense mass of Pyrola rotundifolia, flowering profusely, and literally loading the air with its delightful fragrance. No one who has not witnessed such a scene can form an idea of the beauty of this lovely alpine gem; and the pleasure was no doubt considerably enhanced by the reflection that on this spot, perhaps, the foot of man had never stood, that no sacrilegious hand had ever culled these floral gems before. *Croall, in Hooker's Journal of Botany.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Luculias and other winter blooming plants in beds or borders, should be cut back, after flowering, as freely as may be necessary to keep them close and well furnished, and this should not be deferred so as to permit the energies of the plants to be wasted in the production of useless wood. The small-leaved weaker growing varieties of Citrus are invaluable for winter flowering, and considering that they are plants of very easy culture, it is surprising that more of them are not grown for this purpose. If a batch of healthy young plants can be placed in a moist growing situation at once, and allowed to remain until the young wood becomes rather firm, then removed to a shady place out of doors for the summer months, and fully exposed to the sun after about the middle of August, they will flower profusely during the winter months, if placed in a temperature of about 45° or even 40°. The Mandarin, Myrtle-leaved, and Otaheitan, are the most suitable kinds; the last of these flowers and fruits in a very small state. Get Camellias and Azaleas for early flowering next season started into growth without loss of time. Securing early growth, and allowing the plants a full period of rest, is the way to secure a good display of blossom without either loss of time or injury to the health of the plants arising from forcing them when the blossoms are required. Camellias may be had in bloom early in September by placing them in heat in February so as to get the buds set early, and when once the plants acquire an early habit of starting into growth they make as fine wood as those grown in summer, but, unless plants with prominent wood buds can be selected, there may be some little difficulty in getting them to make free growth the first season. Let the temperature range about 45° at night, and give air freely on fine days, which will tend to make the permanent specimens in the house break their buds slowly and secure close strong growth. Lose no time in repairing the drainage of any specimens which require it, and endeavour to secure a healthy vigorous root action, which is of great importance, especially in the case of hard-wooded plants. Admit air freely on every favourable occasion to greenhouse plants generally, and persevere in the destruction of insects immediately they are perceived. Shift and tie out Pelargoniums as may be required, and allow them plenty of space after this time, with all the light possible and a free circulation of air whenever the weather will permit, but avoid cold north-easterly winds, which are very injurious to plants in active growth. Do not allow Calceolarias to suffer for want of pot room, as any check at the present season will throw them prematurely into flower. Never allow aphides to gain a footing on them, but fumigate whenever one is perceived. Stove.—Attend carefully to plants in active growth, stopping any over luxuriant shoot, in order to equalise the circulation of the sap, and keep them as near the glass as convenient. Persevere in shifting such as require more pot room, as fast as possible. Keep early Gloxinias and Achimenes growing freely; they enjoy a gentle bottom heat, but the Achimenes should be kept near the glass; they make better specimens when they can be afforded a free circulation of air on mild days. Proceed with the potting and rearranging, &c., of Orchids, and be careful to have every plant clear of insects, and the foliage clean before it is passed through hands. Those in flower should be placed in groups in the most conspicuous positions, and where their beauty will be most advantageously seen. Maintain a moist healthy atmosphere, by sprinkling the passages, &c., frequently, and see that specimens on blocks and in baskets commencing growth are kept properly moist.

FORCING DEPARTMENT.

Pinery.—Recently potted stock will not require much water at the root for a few weeks, and it should not be heavily syringed until the plants get hold of the fresh soil, and start into free growth. Keep the atmosphere soft and moist by gentle syringing on the mornings of bright days, and sprinkle the passages, &c., frequently. Plants swelling their fruit will be greatly benefited by manure water, in a clear state, which may be given as often as the soil requires watering. With plenty of moisture in the atmosphere a night temperature averaging from 70° to 75°, allowing it to rise to 85° with sunshine, and a gentle circulation of air, will be beneficial to these. Vineries.—As soon as the berries are fairly set, cut off all superfluous bunches at once, and get those left thinned as speedily as possible. It is a very common practice with young gardeners to over-crop Vines, and the result is small, ill-coloured, ill-flavoured fruit, and disappointment. Aim at securing fruit of first-rate quality, which will be more satisfactory than any quantity of inferior stuff. But depend upon it, that the way to do this is to thin early and severely. The quantity proper to be left must be regulated by the strength and vigour of the Vines, &c., but it should be remembered that it is quite possible to over-crop the most promising Vine. If the border is covered with fermenting materials, see that the heat is not allowed to decline. The buds will now be breaking in the succession house, and when this is the case, the night temperature may range from 55° to 60°. Take advantage of bright days to shut up early in the afternoon with a moist atmosphere, allowing the glass to rise to 75° for about two hours. Figs.—Watch carefully for any indications of red spider or brown scale, both being terrible pests when allowed to gain a footing on the foliage. See that the borders are in a moist healthy state, and attend to stopping the shoots before the fourth or fifth leaf, so as to get the wood matured, in order to secure a second crop. Peaches.—If there is the least apprehension of red spider play the syringe freely on trees where the fruit is fairly set, and commence the process of disbudding. If greenfly makes its appearance fumigate at once. See that the inside borders are properly supplied with water. After the fruit is set let the temperature range about 60° at night, but rather under than above this on cold nights, and with sunshine and a circulation of air it should range about 75° during the day.

FLOWER GARDEN AND SHRUBBERIES.

Give lawns a good rolling after wet, and if it may be necessary to take up any of the turf for the purpose of levelling the ground this should be done as soon as possible. Proceed with edging the walks, and keep these clean and roll frequently to make them firm for walking upon, and also to prevent the growth of weeds. Where it may be necessary to increase the stock of any of the varieties of Dahlias these should be placed in heat at once, in order to secure cuttings. Look to Crocus bulbs, &c., planted in the beds, and protect them from the depredations of mice.

HARDY FRUIT DEPARTMENT & KITCHEN GARDEN.

Prune and nail Peaches and Nectarines, and as soon as this is done, if it is intended to apply a covering for the protection of the blossoms, bring it into use at once, to shade them from the exciting influence of the sun. If the covering can be so arranged as to be easily let down on sunny days, and the trees exposed at other times, it will considerably retard their flowering, and thus will probably be of more service than any protection which can be afforded after the blossoms expand. Where the early crops of Peas have been injured by frost or mice, get some planted in turves with which to make good the deficiencies in the lines. The turves should be cut in widths of about 5 inches, and 3 or 4 inches deep, cutting out a shallow channel about 3 inches wide, and on the under side, in which to place the seed. The turves should then be laid, with the green side under, in a moderately warm house, planting the Peas, and covering them with light soil, where they will soon vegetate. As soon as they are fairly in leaf, remove them to a cool place, and gradually prepare them for planting out. Managed in this way, the Peas will not sustain the slightest check, and will root through the turf into the soil, and grow away freely. If not already done, clean and dress Strawberry beds. A moderate dressing of good rotten manure applied between the rows, and lightly forked in will be of great service to two year old plants; see to keeping up a supply of French Beans, and give those bearing in pots a liberal supply of manure water, and endeavour to keep them in vigorous health, so as to avoid having them infested with red spider.

COTTAGERS' GARDEN.

Where not already done, the main crop of Potatoes should be planted as soon as ever the state of the ground will admit. In the present uncertain state of this crop, the cottager should not plant a great breadth, and should use only early sorts. For, notwithstanding that the Potato is to the cottager the most useful of all vegetables, yet when the third or fourth of a crop cannot be depended upon, the ground may be more profitably occupied. By planting early, and only early kinds, and this on light, and not over-rich soil, there will be a good chance of the crop being pretty well matured before the period when disease has usually commenced its ravages. See that a bed is prepared for Onions, and also that every spare bit of ground is manured and turned over.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Feb. 23, 1854, as observed at the Horticultural Gardens

February.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Of the Air. Min.	Of the Air. Mean	Of the Earth 1 foot deep.	Of the Earth 2 feet deep.	Wind.	Rain.

Feb. 17—Cloudy; uniformly overcast at night.
— 18—Sudden fall of snow, early A.M. to the depth of an inch; clear; boisterous.
— 19—Very clear; bright sun; overcast.
— 20—Uniformly overcast; rain at night.
— 21—Clear and fine; slight frost at night.
— 22—Fine; cloudy; overcast; rain.
— 23—Fine; clear; very clear at night; frosty.
Mean temperature of the week, 2° deg. below the average.

RECORD OF THE WEATHER AT CHISWICK,
During the last 28 years, for the ensuing week, ending March 4, 1854.

Feb. and March.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sunday 26	47.2	33.6	40.4	16	0.48 in.	4	2	3	4	1	8	4	2
Mon. 27	47.6	34.3	41.0	15	0.40	3	5	3	2	5	6	3	1
Tues. 28	48.6	34.6	41.6	11	0.34	1	6	5	1	2	5	3	7
Wed. 1	47.1	35.0	41.1	12	0.62	1	5	2	1	1	5	7	3
Thurs. 2	48.8	36.6	42.7	10	0.45	3	3	3	1	2	9	6	2
Friday 3	49.3	33.6	41.5	13	0.28	2	6	1	1	3	7	6	2
Satur. 4	49.1	32.1	40.6	10	0.48	3	8	1	3	3	5	5	1

The highest temperature during the above period occurred on the 28th, 1846—therm. 64 deg.; and the lowest on the 4th, 1852—therm. 15 deg.

Notices to Correspondents.

Fruit Trees: *S G.* The soil in which the very large Jersey Chaumontels are grown is a deep rich loam; but a fine climate and excessive thinning of the fruit has much to do with its large size. Quince stocks are much employed in Jersey.‖

Galvanised Iron Wire: *D. Manchester.* The Peach tree has been affected injuriously by contact with the above. The wire should certainly be painted.‖

Guano: *An Old S.* The liquid made from this substance should be very weak, and frequently applied. Put a double handful into a pail filled with water. Stir it well two or three times at intervals of not less than two hours. Then let it stand till clear, and pour off the fluid. The solid remainder may be used as ordinary weak manure. Give a quart of the fluid to a Rose tree when it is first beginning to leaf; and repeat the dose occasionally while growth continues. You may apply the clear fluid in the same manner as water. No exacter rules can be given, or, indeed, are needed.

Kitchen Garden: *Grateful.* An acre of kitchen garden is not sufficient for a full supply of vegetables for a large family, together with 20 or 30 servants. There ought, at least, to be two acres allotted; and in that case general crops of Potatoes and Peas should be grown outside.‖

Names of Fruits: *Roaldus.* The Apple purchased in Covent Garden Market is the Court-pendu Plat, and a very good specimen of the sort, most probably a foreign one.‖

Names of Plants. We have been so often obliged reluctantly to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Erzeroum.* 198, Ranunculus illyricus; 1206, Adonis vernalis; 1252, Adonis dentata; 1009, 1023, Rhus Cotinus; 467, Peganum Harmala; 1009, 1023, Rhus Cotinus.—*G O.* Some Catasetum, and probably the common C. tridentatum.—*F.* Zygopetalum Mackaii.—*C F.* It is the Lycopodium involvens, *alias* lepidophyllum, one of the same hygrometrical race as the Rose of Jericho.—*A G.* Begonia dipetala.

The Calendar: *Lucubratory's* letter is sent to the author of the Calendar. It was very ingeniously directed to "Charles Street, Middlesex;" and as there are some dozen Charles Streets, he has given a great deal of unnecessary trouble to the Post-office.

The Vine: *Vitis* and *J H B.* There are plenty of modern treatises on the cultivation of this tree. Hoare, Sandars, Roberts, and many more, can be had through any bookseller.

Misc.: *A Constant Sub.* We do not know the address of Mr. Laing, whose Mammoth Red Celery is advertised by Mr. Duncan Hairs.—*A E*, in the long run will, we hope, find the change a convenient one.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained from the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 60*s.* per ton, and in quantities less than half a ton, at 4*s.* per cwt., for ready money only, and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, and from all the other Agents of the Company. Recommendations and Testimonials may be seen at the Works.

PERUVIAN GUANO, the guaranteed import of Messrs. ANTONY GIBBS AND SONS, Lobos Island Guano, Superphosphate of Lime, and all Artificial Manures, Linseed and Rape Cakes, &c.—WM. INGLIS CABNE, 10, Mark Lane, London.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec. Bridge Street, Blackfriars.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analysis and Assaying, will find ample facility and accommodation at the College.

PEAT MOSS CHARCOAL, AND OTHER MANURES.—The Undersigned are appointed sole Agents by the Peat Moss Charcoal Company, for the sale of this valuable fixer and distributor of ammoniacal matter.

Also on Sale, Peruvian Guano, Superphosphate of Lime, Gypsum, Nitrate of Soda, Bone-Dust, Sulphuric Acid, and all other Manures of known value.—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

SUPERPHOSPHATE OF LIME MANUFACTURED BY MR. J. C. NESBIT'S IMPROVED STEAM MACHINE. The following is the analysis of an average sample.

"College of Chemistry, Agriculture, and General Science, 38 & 39, Lower Kennington Lane, London.

Analysis of Sample of Superphosphate of Lime from Mr. Jolliffe:

Moisture	13.97
Organic Matter, &c.	21.98
Silica	6.05
Phosphate of Lime	35 27
SOLUBLE 16.10	
INSOLUBLE 19.17	
Sulphate of Lime, &c....	22.73
	100.00
Nitrogen (equal to)	1.16
Ammonia	1.41

(Signed) J. C. NESBIT."

Delivered free at a Wharf or Railway Station in London at 6*l.* per ton.—Apply to E. Y. JOLLIFFE, 70, Mark Lane, or the Works, Lavender Dock Wharf, Rotherhithe.

Agents wanted in all the principal towns.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

TO LANDOWNERS, SOLICITORS, ESTATE AGENTS, ETC.

THE LANDS IMPROVEMENT COMPANY, incorporated by special Act of Parliament, 1853, having perfected their organisation, are prepared to receive applications for the execution of improvements, under the provisions of their Act.

The Act extends to England, Wales, and Scotland; and empowers persons in the actual possession of lands, or in receipt of the rents, such as tenants for life, trustees, bodies corporate, incumbents of benefices, mortgagees in possession, guardians of infants, &c., to effect substantial improvements on their estates, and to convert the outlay on such improvements into a terminable annuity or rent-charge of from 14 to 25 years, at will.

The Company, acting under the supervision of the Inclosure Commissioners, will undertake and execute improvements, or will supply the capital to landowners preferring to execute improvements themselves, or will grant the powers of their Act to landowners seeking merely to charge the inheritance with the outlay on improvements from their own funds.

The Agricultural Works of Improvement particularly specified in the Company's Act, are:—

1. The Drainage of any Lands by any such means as the Inclosure Commissioners shall approve.
2. Irrigation, and Warping of Lands.
3. Embanking of Land from the Sea, or Tidal Waters, or Rivers, in a permanent manner.
4. Enclosing or Improving the Drains, Streams, or Watercourses of the Land, under the Inclosure Commissioners.
5. Reclamation of Land lying waste.
6. Making Farm-roads to the extent of one-half of the outlay for such roads.
7. Clearing Lands.
8. Erection of Farm-houses, and other Buildings required for farm purposes to the extent of three-fourths of the outlay for such Farm-houses and other Buildings.

In effecting the above Improvements there may be erected any Engines, Machinery, Engine-houses, Mills, Kilns, Sheds, Yards, Shafts, Tanks, and Reservoirs, Pipes, Conduits, and Watercourses for Irrigation, Tram-roads and other ways, Bridges, Weirs, Sluices, Flood-gates, and Hatches.

For Forms of Application and further Information apply to the Hon. W. NAPIER, Managing Director, 2, Old Palace Yard, Westminster London.

MORNING FROSTS.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

PATENT ROOT GRATING MACHINE.

BUSHE & BARTER'S PATENT ROOT GRATING MACHINE, Manufactured and Sold by ALEX. SHANKS & SON, Arbroath, Forfarshire, from whom particulars, with prices, may be had.—Arbroath, Feb. 18.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d.
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water; Fire Engines, &c.

An Illustrated Book sent on application post free.

REDUCTION IN PRICE.

WEIR'S IMPROVED GALVANISED WROUGHT IRON LIQUID MANURE PUMP.

The Fittings of these Pumps are wholly of Brass, and there is no leather or other matter which can be affected by the manure.

Price, complete, with 10 feet of Flexible Suction Pipe, 4*l.* 15*s.* Terms, cash on delivery.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, London. Removed from Oxford Street.

Catalogues, with Illustrations, sent free by post.

TO AGRICULTURISTS, GARDENERS, ETC.

BENNETT AND NAYLOR, GENERAL IRONMONGERS, and FACTORS, Sole West End Agent for PARKES', late WINTON PARKES' CELEBRATED STEEL DIGGING FORKS and TOOLS. Also for the only efficient Stove, with or without a flue, suited particularly for Conservatories and Greenhouses, Patronised by her Majesty. Price 12*s.*, and upwards, at the Great Western General Ironmongery Warehouse, 255, Oxford Street, between Park Street and North Audley Street. Established for the sale of all descriptions of Ironmongery at Wholesale Prices. Sheet, Hoop, Rod, and Bolt Iron; Locksmiths and Bell-hangers. Patent Fuel, to be used with the Stove, 2*s.* 3*d.* per bushel.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

HOSE PIPING.

TO ENGINEERS, AGRICULTURISTS, GARDENERS, SHIP-CHANDLERS, AND FIRE BRIGADES.

WAITHMAN'S PATENT FLAX TUBING (1-inch to 3-inch diameter) will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe, and about half the price of either the gutta percha or the seamless hose. It is prepared so as to be anti-rot.

Manufactured only by WAITHMAN & Co., 36, High Street, Manchester.

HOSE PIPING.

GREAT REDUCTION IN PRICE.

WAITHMAN'S PATENT FLAX TUBING, (1 inch to 3 inches diameter).—London Agents: BURGESS and KEY, 103, Newgate Street, and 52, Little Britain, London, who, on application, will forward List of Prices.

IMPROVEMENT OF GRASS LANDS.

SUTTON'S RENOVATING GRASS SEEDS FOR IMPROVING OLD PASTURES, CLOVERS, and the finer and more nutritious sorts of GRASSES.

Quantity of Seed required, 8 lbs. to 12 lbs. per acre. Price 1s. per lb., Carriage Free.

All orders executed in rotation, in strict accordance with priority of our receiving the same.—Address,

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

GIANT SAINTFOIN.—*The true Giant Saintfoin may be had genuine of the undersigned, at 12s. per bushel, or cheaper in large quantities.*

For particulars, address JOHN SUTTON & SONS, SEED GROWERS, Reading, Berks.

RENDLE'S AGRICULTURAL PRICE CURRENT AND FARM DIRECTORY FOR 1854 *is now published, and can be obtained in exchange for six postage stamps, from* WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

THE LABORATORY OF THE ROYAL POLYTECHNIC INSTITUTION is always open for the reception of Pupils under the direction of J. H. Pepper, Esq., F.C.S.A.C.E., &c. Careful Analyses and Assays of Soils, Minerals, Waters, Mercantile or Agricultural Products, are performed with despatch, accuracy, and economy.

For terms apply to R. I. LONGBOTTOM, Secretary.

BATH AND WEST OF ENGLAND AGRICULTURAL SOCIETY, for the Encouragement of Agriculture, Arts, Manufactures, and Commerce. Established 1777.

The next Annual Meeting of the above Society will be held at the City of Bath, on the 7th, 8th, and 9th days of June next, when Prizes to the amount of 702*l.* will be awarded for Cattle, Sheep, Horses, Pigs, Agricultural Implements, Models, and Essays on Agriculture, and 114*l.* for Poultry and Pigeons.

The Trial of Implements will take place on the 5th and 6th days of June next. There will be a Public Dinner on Thursday, the 8th, President WILLIAM MILES, Esq., M.P., in the Chair.

Further particulars will be announced in the Programme, which may be obtained after the 1st of May from Mr. H. St. JOHN MAULE, Secretary, Bath; or of Mr. J. D. BUSH, Secretary to the Exhibition Committee, 10, Fountain Buildings, Bath.

The Agricultural Gazette.

SATURDAY, FEBRUARY 25, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS

WEDNESDAY, March 1—Agricultural Society of England.
THURSDAY, — 2—Agricultural Imp. Society of Ireland.
MONDAY, — 6—Central Farmers' Club.
WEDNESDAY, — 8—Agricultural Society of England.
THURSDAY, — 9—Agricultural Imp. Society of Ireland.

A VERY interesting discussion took place last Wednesday before the Royal Agricultural Society on SUBSTITUTES FOR GUANO. Mr. BULLEN referred to the waste of the Newfoundland fisheries as a source whence either by simple desiccation, or by PETIT'S patent process, large quantities of fertilising material might be profitably drawn. Mr. SLANEY laid before the meeting facts drawn from his own experience, as a commissioner under the Health of Towns Act, illustrative of the great value of sewage matter as manure. Mr. WAY referred to blood, as a source, now disregarded, from which considerable quantities of a manure, equal in value to Peruvian guano, might be derived; and Mr. CAIRD referred to the waste of our sugar refineries, as a source also nearly disregarded, from which 50 tons per week in London alone of a soluble manure might be obtained.

On the availability of fish refuse for agricultural purposes we regret to say that this discussion did not present any very encouraging prospect. Mr. BULLEN considered that unless the waste could be had for nothing, no profit would arise from its conversion. If it were to cost from 30*s.* to 2*l.* a ton, as it was expected to do on the west coast of Ireland, that would be fatal to its use in agriculture; for, according to Mr. WAY, 3 tons, and according to other speakers, 4 or 5 tons of the raw material, were needed to make 1 ton of the dry manure, which would thus cost from 5*l.* to 8*l.* in raw material only. In Newfoundland it was stated that very large quantities of refuse fish, and of the refuse portions of the useful fish, are thrown away, and *could*, therefore, be had for nothing; and Mr. BULLEN therefore looks there with greater hopefulness than to the Irish coast as the source of our artificial guano. Mr. WAY, however, pointed out that in Newfoundland wages are very high, and that, supposing hands could be got in that locality, they would be more profitably employed in curing edible fish for the unlimited market which exists for them, than in converting waste fish into manure, even though it were to be had for nothing. Besides, though nominally valueless at the places where it is now wasted, a considerable cost would be incurred in carrying it to the localities where the manure manufactories would

have to be established. And if Mr. Caird was correctly informed, on the occasion of a previous meeting of the Society, we may well ask, if, below the depth of improbability that we shall ever find our guano in fish, to which Mr. Bullen reduces us by his admission that the fish must be had for nothing for the purpose, there be not a lower deep still at which the truth of the matter really stands. For Mr. Caird stated that the original importers of Ichaboe guano were ruined by the speculation, though the article for which they went really too, to be had for nothing—the article in that case, *was* being not merely the raw material of a manure—but the manure itself ready made, and in the condition in which the farmer applies it to the soil. The utilisation of waste fish, except in the immediate localities of the waste, is, we fear, still an unsolved problem, and likely to remain so; and that not merely owing to imperfections in the process of manufacture—though these, according to Mr. Caird, are still considerable—but also owing to the existing relations between the cost of raw material and the value of the manufactured article.

On the subject of sewage manure, the difficulties were wholly of the former class — for the raw material was in this case to be had for nothing; but these difficulties had been sufficient, nevertheless, to spoil almost every plan which had hitherto been adopted for rendering it agriculturally useful. To some of them we shall hereafter refer; meanwhile, we make one remark on that particular scheme about to be tried at Glasgow to which Mr. Caird referred as so successful in abstracting both the suspended and the dissolved substances contained in sewage, that gold fish would live in the clear water running to waste. The process consists in successive filtrations through burned clay and peat charcoal.

Now, a very interesting paper was read by Dr. Stenhouse at the meeting, on the same day, of the Society of Arts, in which the disinfecting properties of charcoal were explained. But here it was as a filter of air, not as a filter of water, that it was treated; and while its powers in the former capacity were most ably discussed and illustrated, those which it possesses as a filter of water seem still to stand in need of explanation. We were informed that charcoal is not an antiseptic, as it is generally called. In fact, it greatly *facilitates* those processes of decomposition in which the oxygen of the air exhibits its influence on organic matter. All that it does in the way of purifying the substances to which it is applied is, by the condensed oxygen which it holds in its pores, to complete that process of oxidation; so that, instead of the offensive and unwholesome intermediate products of imperfect oxidation, we have only the comparatively harmless and inoffensive carbonic acid, water, and nitric acid, resulting from perfect combustion; just, in fact, as in some of the smoke consuming processes, the object is attained by the mixture of pure atmospheric air with the heated smoke, so that a supplementary process of combustion is effected, by which all the smoky products of imperfect combustion are converted into clear gas.

Charcoal thus becomes an admirable filter for air, and Dr. Stenhouse brought under our notice a respirator in which the substance was well applied as a defence for medical men, to disinfect the often fatal air of hospitals, more especially in the West Indies, New Orleans, &c., during the continuance of fevers. That it also possesses powers as a filter for water has long been known; but though its use in this way, whether in farm-yards or in towns (see the paper on the Manchester Sewage Company's operations in another column) has long been understood, how far it is able to detach the soluble as well as the mechanically suspended foreign matters there present in the water, we are unable to state. We believe chemists do not think so highly of its powers in this respect, and we should be very glad if these remarks should elicit from any one who may have studied the subject information on a matter which is likely to be of such agricultural importance.

We have received a note from Dr. Voelcker in reply to the second letter of our correspondent "C. L.," on the Management of Manure—the substance of which we shall state in this place, as the misunderstanding (for that is all that it amounts to) may thus be more satisfactorily removed, at the same time that the important subject to which it relates may be more prominently brought under the notice of our readers.

It appears that two statements occur in the article "Manure," in the "Cyclopedia of Agriculture" now publishing by Messrs. Blackie & Son, which at first seem irreconcileable—the one asserting (page 338) that "well-fermented or perfectly-decomposed manure contains much more nitrogen than fresh;" and the other detailing the losses of ammonia during the fermentation of manure in a manner which, it is said, leads one to an entirely different conclusion. For, three periods are spoken of in the process of fermentation, and "chemical analysis," it is said, "has shown that 100 cwt. of common farm-yard manure contain about 40 lbs. of nitrogen; and that during fermentation in the first period 5 lbs. of nitrogen are dissipated in the form of the volatile ammonia; in the second, 10 lbs.; and in the third, 20 lbs." Our correspondent "C. L." concludes from this, that 35 lbs. out of the 40 have been lost; and that although during these periods the manure may have become reduced in substance to the extent of 50 per cent. by the loss of other things, yet, as it retains only one-eighth or 12½ per cent. of its nitrogen, it must now be greatly poorer proportionally in that element than it was originally—a conclusion directly the reverse of that intimated in the extract from p. 338. That the writer himself did not admit this conclusion is plain from the words which follow this statement of the losses sustained respectively during these three periods. He does not gather from it that 35 lbs. of nitrogen out of the original 40 have been lost, for he says:—"Completely decomposed common manure has thus lost about *one-half* (only 20 lbs.) of its most valuable constituents." And though there were no other indication of the author's meaning, this, one would think, might have sufficed to show that the periods referred to were not consecutive periods, but periods commencing all at the same point of time; the third, therefore, including the others.

The meaning, if we assume actual dates, would therefore be to this effect:— that 100 cwt. of common farm-yard manure, fresh on the 1st of March, contained 40 lbs. of nitrogen; that during the first period (March 1 till April 1) it lost 5 lbs. of nitrogen; in the second (March 1 till June 1), 10 lbs. of nitrogen; in the third (March 1 till October 1), 20 lbs.; this being the total loss since the commencement, and corresponding, as the writer estimates, to "one-half of the most valuable part of the manure." "First," "second," and "third" are, no doubt, consecutive numbers, and if taken apart from the concluding sentence, the passage might have led the reader to the conclusion which "C. L." had gathered from it, were it not that the "periods" named are not indefinite portions of time mentioned for the first time in this place: they are not "periods" merely, but "*the*" periods referred to in an immediately preceding passage, where it is said:—"Direct experiments have shown that 100 cwt. of fresh farm-yard manure are reduced to 80 cwt. if allowed to lie till the straw is half rotten; 100 cwt. of fresh farm-yard manure are reduced to 60 cwt. if allowed to ferment until it becomes fat or cheesy; 100 cwt. of fresh farm-yard manure are reduced to 40—50 cwt. if completely decomposed;" and then follows the remark about the loss of nitrogen during *these* periods. The meaning obviously is, as we have now explained in detail, and as we think it plainly appears in the passages quoted, that the losses of nitrogen must be referred to the very times which are mentioned here as witnessing these great losses of weight; so that 20 cwt. of the latter disappear with 5 lbs. of the former, 40 cwt. of the latter with 10 lb. of the former, 50 to 60 cwt. of the latter with 20 lbs. of the former; the rapidly diminishing nitrogen in each case (at least if the 60 cwt. in the last be taken) being present with a still more rapidly diminishing gross weight of manure, so that the truth of the original passage as to the increasing proportional quantity of nitrogen as fermentation proceeds is made out, and Dr. Voelcker's consistency throughout is maintained.

Of course this, in the case of a teacher of such high reputation, is matter of sufficient importance to have made "C. L." anxious for the explanation which has been now, we submit to him, satisfactorily given—but the facts of the matter in their bearing on farm practice are more important still, and we are therefore glad that we next week shall be able to direct the reader to one fruit of this discussion in an excellent practical article on the subject of it by our valued correspondent "S."

While food for man, as well as food for plants, is so scarce and dear—economy in the manufacture of bread, and economy in the manufacture of manure, are both subjects well claiming the attention of our agricultural societies. We regret, therefore, that we were not able last week to give in detail the information elicited at the meeting of the English Agricultural Society on the important subject of cheap bread. The communication from Calais, transmitted to the Society on this subject by Viscount Palmerston, contained the following recipe:—

1. Economical Wheaten Bread.—Only the coarsest of the bran is to be taken from the Wheat; and the second coat, or what is called pollard, ground with the meal, as is usual for wheaten bread. Five pounds of this bran are to be boiled in somewhat more than four gallons of water, in order that three gallons and three quarts of clear bran water may be poured into and kneaded up with 46 lbs. of the brown flour; adding salt as well, as yeast, in the same way as for other bread. When the dough is ready to bake, the loaves are to be made up and baked two hours and a half in a pretty brisk heat. As flour when thus made up will imbibe three quarts more of this bran liquor than of common water, it evidently produces not only a more nutritious and substantial food, but augments it to one-fifth part of the usual quantity of bread; consequently, it is a saving of at least one day's consumption in every week. If this bread were in general use it could be proved to be a saving to the nation of near ten millions per annum. This bread, too, has the following peculiar property: if put into the oven and baked for 20 minutes, after it is ten days old, it will appear again like new bread.

2. Economical Bread.—In times of scarcity, or when flour is very dear, the price may be reduced by the substitution of a quantity of Turnips. Wash, clean, pare, and afterwards boil, a number of Turnips till they become soft enough to mash. Dress them dry, mix them with an equal quantity of Wheat-meal, and make the dough in the usual manner with yeast. It will rise well in the trough, and after being well kneaded, may be formed into loaves, and baked. Bread prepared in this manner will have a sweet taste, which is by no means disagreeable. It is as light and as white as the wheaten, and should be kept 12 hours before it is cut, when the smell and the taste of the Turnips will scarcely be perceptible, but which can be got rid of altogether by using a little carbonate of soda.

In the report on this subject by the Secretary of the Society, the following references to works where the subject has been already treated, are given:—

1. Parmentier's Essay, which in 1769, the year of general famine, gained the prize of the French Academy for the best account of substitutes for bread.

2. Mrs. Rundell, in her Cookery, gives almost the identical recipe for making what she calls "The Rev. Mr. Haggett's Economical Bread;" her proportions, however, of flour being 56 lbs., instead of 46 lbs., as recommended in the Calais communication.

3. Mrs. Smith, in her "Female Economist," remarks: "Economical bread is made in the same manner as other bread, only the water is boiled with a quantity of fine bran in it; when strained off mix the water with the yeast, and make the dough with it."

4. In the "Magazine of Domestic Economy," Vol. II., p. 366, it is stated:—"We think that a highly flavoured brown bread should be attempted from 24 lbs. of the finest flour, with the addition of one-fourth (6 lbs.) of second toppings, and made up with bran-water; that is, with water in which as much bran has been boiled as will allow of its boiling freely for five minutes, and yet to yield the full quantity of fluid required, after separating the bran by a hair sieve."

5. In James's patent for the manufacture of a very absorbent but good bread, a portion of the flour is in the first instance boiled with the whole of the water, which is intended to form dough with the remaining flour.

6. Dr. Otto, of Brunswick, and Prof. Weppen, Markoldendorf, concur in their opinion of the value of bran, on account of the glutinous and, therefore, nourishing matter which it contains.

7. The original communication on Turnip bread, published in the "Museum Rusticum et Commerciale," and given at length in the "Encyclopædia Britannica," Art. Bread, is evidently the one from which the Calais recipe has been extracted; the latter, however, recommending the addition of carbonate of soda, for the purpose of removing the Turnip flavour from the bread.

BRITISH MANURES.

Referring to the various communications which have from time to time appeared in the *Agricultural Gazette* on the subject of British manures, and the preparation of fertilisers to compete with or supersede foreign guano, I venture to request the favour of your insertion of this communication as a contribution of the results of many years' practical experience in the deodorisation and treatment of sewage and other refuse matters in the preparation of manures. The Manchester Sewage Guano Company commenced operations in the year 1850, in the preparation of manures which they called "sewage guano." The company under the superintendence of two of the directors, one a practical chemist and the other a practical engineer, prepared and sold manures manufactured by the following and other processes, viz.:—1. The filtration of sewage through animal and vegetable charcoal; 2. The precipitation of the solid matters of sewage by lime, lime water, &c.; 3. The evaporation of the water in urine, night-soil, ammonia, water, &c.; 4. The desiccation and deodorisation of fish, blood, flesh, and other animal matters; and, 5. The mixture of these concentrated products and other chemical materials with animal and vegetable charcoal, which absorbs to an extraordinary extent the concentrated liquid thus prepared, and which, when mixed with the solid parts of the fish, flesh, bones, blood, &c., in the manner which experience has pointed out as the best, forms the Manchester sewage guano. Dead horses, sheep, &c., diseased flesh meat, and fish seized as unfit for human food by the City authorities, have been worked up without causing any nuisance by the process. Various chemical analyses have been made of this manure, which is found to contain a larger proportion of ammonia, phosphates, urates, and other fertilising properties, than an equal amount in value of foreign guano. The company have recently erected new works, at a large expense, with the requisite conveniences of steam power, tanks, drying stoves, evaporating pans, retorts, sheds, &c.; and although they have not yet had the gratification of receiving any return in the shape of profit, they feel confident from the fact of the demand for their manures having last year been greater than they could supply, that a reasonable profit may be fairly expected from their future operations.

The company have never taken out a patent; and although they naturally refrain from publishing the particulars of the various processes adopted, they would gladly see a host of competitors arising for the manufacture of a British manure from waste materials, which are now the cause of nuisance, sickness, and excessive mortality. Numerous patents have been taken out for processes which the Manchester Sewage Guano Company have used for some time. Several of the directors of the company have been engaged in

experiments in disinfecting and deodorising sewage and other waste materials of towns for upwards of 14 years, and the company's operations have had the benefit of this extensive and varied experience. The subject is one of considerable difficulty; and to successfully carry out requires the aid of capital, chemical and engineering knowledge, agricultural experience, business habits, and patience. The experience of the Manchester Sewage Guano Company may be valuable in exciting more vigorous efforts in the right direction for the attainment of the desirable object in view, which may with truth be considered the great agricultural and sanitary question of the day, viz., the preparation of a valuable fertiliser from the refuse and injurious waste materials of our towns. There is abundant room for every well directed effort, and I heartily wish success to all who earnestly set about the accomplishment of the desired object, and thank you for the aid you have given to the cause. *John Thompson, Secretary to the Manchester Sewage Guano Company, 3, Watling Street, Manchester.*

Home Correspondence.

Management of Manure.—In reply to "C. L., Cirencester's" rejoinder to my note on the management of manure, I will only say that his calculations are based on entirely erroneous premises. If "C. L." will take the trouble to read carefully my explanations, he will find it distinctly stated that 100 cwt. of fresh manure in keeping until the straw has become half rotten will be reduced to 80 cwt., and will have lost 5 lbs. of nitrogen. That in keeping until it has become "fat and cheesy," 100 cwt. will be reduced to 60 cwt., during which time they will have lost 10 lbs. of nitrogen absolutely, and not as "C. L." presumes, 10 lbs. in addition to 5 lbs. And lastly, that in keeping until it has become perfectly decomposed, the original 100 cwt. will be reduced to 40 cwt., during which time they will have lost 20 lbs., and not as "C. L." represents me to say, 20 lbs. in addition to 10 lbs. and 5 lbs. If fresh manure contains 40 lbs. of nitrogen in a perfectly decomposed state, the 40 remaining cwt. will thus contain 20 lbs. of nitrogen, and not 5 lbs., as indeed "C. L.'s" calculations, but not mine, show. *Aug. Voelcker, Cirencester.*

What has Science done for Agriculture? (see p. 107.)—Your correspondent, who signs himself a "Farming Landowner," ought to be reminded of the distinction between the chemical action of quicklime and of its carbonate. It is the latter which is introduced into the formation of artificial nitre beds, and which is found so useful in fixing the nitric acid generated by the decomposition of the animal matter present. This, therefore, being the object of its application, it would seem a safer practice to mix with our dung-heaps the carbonate than the earth in its caustic condition. In the latter state, indeed, it may accelerate those processes of animal decomposition by which nitrogen is evolved; but until we know more fully by what conditions the generation in our climate at one time of nitric acid and at another of ammonia, is determined, it would be rash to infer, from the apparently successful practice of certain west country farmers, who have been in the habit of mixing quicklime with their stable dung, that the objections to this method of proceeding, founded upon chemical considerations, are to be in all cases set aside. When nitric acid only is produced, the presence of caustic lime cannot be supposed to be prejudicial; but when ammonia is generated, it must favour the disengagement of this latter product; although even here the evil would be counteracted by the addition of a sufficient quantity of some absorbing substance, by which the escape of the disengaged ammonia may be arrested. The practical farmer, therefore, instead of appealing to this apparent discrepancy between theory and practice, as an argument against the use of science in agriculture, should rather consider that this very discrepancy has arisen from the imperfection of our scientific knowledge, and may therefore be best corrected by a more thorough investigation of the principles upon which the success of the practice depends than has hitherto been undertaken. *Charles Daubeny, Oxford, Feb. 21.*

Land Drainage, Stoppage of Drains, &c.—A correspondent in your paper of the 21st of January last asks for some information as to the stoppage of drain outfalls from rootlets, which he has found hanging to the grates of such outfalls. I regret to say, as a practical man, that I am during every flood teased and annoyed with the same incorrigible enemy; in fact, for the last six weeks I have daily found drains stopped near to the outfall, choked up, and the water making its exit, as your correspondent describes, through the masonry, the whole of the drains being at least 4 feet, and the same enemy even where drains are 11 feet deep. With regard to the trouble your correspondent is in, and how to prevent it hanging upon the grate, I can say that the remedy is easy, viz., by hanging the grate loose instead of having it fixed in the masonry of the outfall, so that in a flood, should the bars become clogged, and so prevent the water from freely escaping through the cavities, the grate will open by the pressure of the water, and so make its escape; and as soon as the flood subsides the grate will shut, and so prevent the entrance of vermin. This plan I have adopted, and find it answer exceedingly well. I feel quite convinced the roots spoken of do not proceed from the mouth of the drain; on the contrary, I always find them most at the higher part of each lateral drain (very seldom any in the main). This I account for by the superior pressure of water at the low end of the drains flushing and driving out the roots and sediment before they gain strength to offer much resistance. As to what the root is, or where it originates, I cannot give the least information. It enters the pipes in a small thread, and increases in thickness as it proceeds in distance up the pipes, always growing against the stream. I have not much fear of stoppage if the outfall is attended to and the grate hung in the way I have described. *John Howell, Myddelton, Otley, Yorkshire.*

Stoppage of Drains.—Three years ago I drained a field of 4 acres with 1¼-inch pipes and collars, 5½ feet deep. Two or three weeks since, I observed symptoms of failure in the drains, and last week I had two or three of them opened; I found a growth of roots in many of the tiles, and in one place in particular the drain for several feet in length was thoroughly stopped by a complete felt of rootlets (I enclose a portion), and the particles of sand and earth they had intercepted. These rootlets appear to resemble, at least when wet, coarse human hair as much as anything. The field in question was in Grass when drained and is so still. It is somewhat remarkable, too, that these rootlets have not only penetrated through the collars, but have thriven in the pipes, notwithstanding an impregnation of the drainage water with iron, so strong as to have formed a crust or coating on the interior of every tile. I enclose also a specimen of the plant which I believe to be guilty of the mischief. *A.* [We received the root but not the plant.]

Cost and Returns of Pasture Draining.—I beg to say, for the information of "C. P.," that I have drained permanent Grass land, in Sussex, to great advantage, at *1l. 13s. 4d.* per acre; distance 4 poles from drain to drain, depth 3 feet, soil sandy loam; no main drains were required. I consider the increase of hay and aftermath equal to *12s. 6d.* the first year. *W. H. R., Tunbridge Wells.*

Cattle Feeding.—I would recommend gentlemen who are desirous of really benefiting agricultural science to imitate the careful and painstaking methods pursued by Mr. Lawes, of Rothamsted, in all his valuable experiments, and if they rely upon calculations, to see that they are correct before giving them to the public. I have been led into making these remarks by the publication in the *Agricultural Gazette* of a letter from a gentleman signing himself "Aliquis," who, after handsomely acknowledging the correction of his calculations by another writer, and being apparently convinced against his will, tries to re-establish his favourite theory by the following,—the point under discussion being the profitable gain of certain beasts whose live weight was—

At the conclusion of the experiment	... 4911¼ st.
At the commencement	... 4193½ „
Or total gain during experiment	... 717¾ st.

But "Aliquis," in order to carry his point as to proving the profitable feeding of the beasts, misapplies Mr. Ewart's tables for calculating the dead from the live weight in the following singular manner. The tables he quotes as follows:—

Condition.	Per cent. of beef of live weight.
Half fat	50 to 55
Moderately fat	56 to 60
Prime to very fat	61 to 63

And then, assuming the beasts under discussion to yield 50 per cent. of their live weight at the commencement, and 60 per cent. at the termination of the experiment, instead of, as Mr. M'Culloch the reporter himself reckons, 55 per cent. in each case, he triumphantly makes out his calculation thus:

	Live weight.	Dead weight.
At conclusion of experiment ...	... 4911¼ × .6	= 2946.7 st.
At commencement	... 4193½ × .5	= 2096.7 st.
Increase		850 st.

But the whole gain of the beasts is but 717¾ stones, and a portion of this must be deducted for increase of offal. Where, then, can be the 850 stones? This is a good specimen of the *reductio ad absurdum. H. C.*

Covered Rick-yards in Midland Counties.—About three years since I erected a covered homestall at a farm near Stratford-on-Avon, according to a plan furnished me by Mr. Beadel, of Chelmsford; to this I have since added a covered rick-shed 48 feet square and 22 feet high, into which I put the produce of 50 acres of Wheat the last harvest, being not less than 1500 bushels. It is very useful during harvest, and also as a straw-shed after the corn is threshed; it is built on red Pine supporters, and slated. I have a fixed steam-engine, and also a pair of stones, which are found very useful during the feeding season. *Richard Greaves, Cliff House, Warwick.*

Whole Meal.—Under the present high price of Wheat and prospect of scarcity before the next harvest, it is of the utmost importance to every one that the best possible application should be made of the cereals which are used for family consumption. Every experienced family housekeeper knows that a much larger amount of material for the table arises from Wheat simply ground into bread-meal (that is, the full produce of whatever grain, previous to the bran being extracted therefrom) than from finely dressed flour arising from the same quantity of grain; and there are many of our intelligent people who know that, for the promotion of the health of a family, the loaf made from bread-meal is a better and more healthy diet than the loaf made from flour; and also that the fermented loaf, made either from flour or bread-meal, is a decidedly more economical and digestible article of domestic consumption than the cake so common in the cottages of the labouring population of our country. By the term "cake," I mean the produce of flour kneaded in milk or water with a little butter, and without fermentation. *B.*

The Gulf Stream.—It appears to me that in the article in your Paper, of the 21st ult., you have as much underrated the effect of the Gulf Stream on the climate of England as others have been disposed to over-rate it. I willingly admit that the Gulf Stream would have little effect on our climate were our prevailing wind in winter from the east; but is not the natural temperature of the south-west wind much raised, and the quantity of aqueous vapour contained in it increased by its blowing almost entirely over the large body of comparatively warm water contained in the Gulf Stream? You refer to the remarkable dip of the Isothermal line that passes through the South of England as it approaches the American coast. Surely this dip is increased by the cold current from the Arctic Seas which skirts that coast, first as a divided and important current to about lat. 40°, and thence as a cold counter current between the land and the heated waters of the Gulf Stream (see "Johnson's Physical Atlas" 4to edition, plate 6). While, therefore, the effect of wind upon our climate is doubtless great, I think that it is much increased or modified near the coast by oceanic currents. *A Kentish Landowner.*

On Planting Young Fences.—As this is the season generally chosen for planting young fences, and making alterations in old ones, I thought a few remarks on the subject would not be out of place on a theme which interests most of those engaged in agricultural pursuits; in the first place, the land intended for the fence should be thoroughly cleaned and manured, and if in a wet situation, it ought to be a little raised above the surrounding surface, as quickwood, which most fences are composed of, is not fond of a wet situation. Every person who plants a fence wishes it to become strong and thick in the shortest possible time, and for this object most people require strong Quicks; some plant it and let it remain all the length; others, as soon as planted, cut it down, or do so before planting—this is quite a mistaken idea of making a thick fence in the shortest time; and leaving the plants their whole length is almost as bad, as the energies of the one are destroyed, and in the other the fence is always open at the bottom, and has to be cut and carved all ways to make it anything like a fence. The best way is to thoroughly clean the land, and trench it two spits deep, adding plenty of well-decayed manure; plant at an open season in February, or early in March, leave the plants their whole length the first season, and cut them down to 6 inches above the surface in February of the succeeding season, when they will have got thoroughly hold of the soil, which it is impossible for them to do when planted; the shoots they will produce will be strong and healthy, which is not the case when cut down the first season. When the shoots are of sufficient length they may be stopped with the shears or bill-hook, and by going over them every season the fence will be always thick and strong, and kept so at the least expense. Privet is a capital plant for thickening fences, and will thrive on any soil, and will bear clipping and cutting the same as Thorn. Intermixed with Thorn, say one to every four plants, the hedge will be greatly improved; as it retains its foliage during the winter, it makes a better shelter for stock. *Henry May, The Hope Nurseries, Bedale, February 3.*

The College Agricultural Diploma.—It gives me great pleasure to observe in a late leading article, that the diploma of the Royal Agricultural college is beginning to be estimated at its proper value. As long ago as April, 1850, I opened the subject in the columns of your journal, and I then endeavoured to impress upon landlords the importance it would be to them that some standard of qualification should exist, by which they might judge of the competency of those whom they entrusted with the care and management of their estates. To the commonest understanding it must be apparent that a diploma honourably obtained by punctuality in attendance on the lectures and practice of the college, and by passing such an examination as is there required, is not only the best guarantee to the landlord of the capability of the possessor for an office of trust either as steward or tenant; but it is the surest indication that he is also desirous of raising himself to such a *status* in society as will obtain for him a respect commensurate with his acknowledged acquirements. In the Royal Agricultural College, to a magnificent edifice is attached all the appurtenances necessary to make it a model establishment, and it is presided over by a gentleman qualified in every respect for the post. A brilliant corps of professors superintend instruction in the different departments; and in an extensive farm and farm-buildings the more practical work is carried on, on a scale and in a style which calls for our warmest admiration. But do the students for whose benefit these things are provided, leave the college after the expiration of their terms duly fitted for the important and responsible duties that are to devolve on them? It cannot be denied that some do, and honourably have they acquitted themselves in after life; but simply from the circumstance (and it must operate against real progress in scientific farming), that the possession of the college diploma is optional, and that places of trust can be obtained without it, the great majority of them depart and embark in life with but a very slender acquaintance with those principles on a correct knowledge of which their future success depends. I refer in confirmation of this statement to your own article, which mentions six only in three years who have received the diploma. Assuming the average number of students to be 70 annually; this would be, say 3 per cent. Now, considering the enormous amount of agricultural property annually changing hands, the

responsible nature of the duties attached to its possession, and, besides, the singularly anomalous relation which exists between landlord and tenant (witness the tiresome and ridiculous conditions of many leases of tenure, evincing the low opinion of the landlord for the tenant's judgment and intelligence), I cannot but believe that some plan might be devised that would make it necessary to obtain a certificate of qualification before a tenant occupies the land, or a steward steps into office. And I throw it out as a suggestion worthy the consideration of the patrons and governors of the Royal Agricultural College, whether by setting an example in their own estates when a vacancy occurs, by installing in preference a candidate who possesses the college diploma, they would not be furthering an object of the highest importance to themselves, and to the agricultural interest generally. *Iota, Cirencester.*

What shall we do with our drainage? is a question that excites great general attention, and it involves another equally important to the farming interest, namely, if the sewage of towns be a nuisance which ought to be removed, and may be made so available as a fertiliser as even almost to rival the famed but costly guano, how and in what state could it be used upon the farm with the greatest advantage, *i. e.*, as a liquid, entire as it flows from the drain; or in a solid dry state, and deprived of its water by filtration, or by chemical precipitants? If the reader consider the report of one analysis of a specimen taken from a London sewer as a trust-worthy evidence, he may without difficulty be able to arrive at something like a rational opinion of the chemical state of the question:—"Sewer water from Barrett's Court, an imperial gallon contained of substances in solution 243.30 grains; insoluble substances, 248.96 grains." The soluble substances, which comprise nearly 37 grains of ammonia, and at least 79 grains of salts, pass away, and are lost by the acts of common filtration or of subsidence. And matters remain not much better if peat charcoal be employed as a filter. As to the 248 plus grains of insoluble substances, they comprise only 4 56 grains of ammonia, much flint and lime, and very little phosphoric acid. Having no adequate space for enlargement, it must suffice to direct attention to the vast returns of rich herbage about Edinburgh, produced by the entire sewage of the drains, in order to establish the one leading fact, and thus prove that, by straining off the liquids, the solid matters are rendered little better than an effete, intractable mass of rubbish. *J. T.*

Direction of Drains.—In your Number of Oct. 29 Mr. Bailey Denton observes, "Now that the question of direction of drains is fairly afloat, let it be fully discussed, that the reading of the *Gazette* may have a practical effect." From that time to this, with a slight *hiatus*, the subject has been under discussion, and very interesting, certainly, have several of the communications been. But, from too much of that which I have previously commented upon, we seem to be as far from the "practical effect" as we were before the discussion commenced. The advocate of each "system" still pertinaciously adheres to his pet theories, and fails to be convinced, even by very stubborn facts, that other rules are sometimes most correct. Mr. Hewitt Davis states in your Number for Jan. 7, "Every attempt that I have ever known to drain out of the line of greatest fall has been imperfect." Now, this is such a bold statement on the part of a member of the profession to which I have the honour to belong, that, feeling it demands some notice from those whose practice convinces them that there are instances to which the remarks would not apply, I cannot refrain from again troubling you with a few observations. I presume, from the general tenour of Mr. Davis's communication that his remarks are to be understood as furnishing a practical confirmation of the correctness of the theory in all cases; indeed, his quotation of Mr. Denton's words as a *because*, seem to justify my impression. The communications of Mr. Trimmer are of such recent date, that I need do no more than refer your readers to them, for a proof of strata of soils so conformed as to require for their most efficient and economical drainage, that the drains should be laid obliquely to the line of greatest inclination of surface. A more detailed description of the same will be found in the last Number [Part I.] of the "Agricultural Society's Journal," in which is an excellent paper upon the subject, from Mr. Trimmer's pen. My own practice enables me to confirm the existence of deposits so conformed as Mr. Trimmer describes them, and I could cite other peculiarities of soil and substratum, which demand the same treatment. But it appears to me to be unnecessary, because any one whose practice is tolerably extensive, and whose judgment is not fettered in its action by very pretty certainly, and feasible withal, but still mere theories, will know that such instances are sometimes met with; and it would really be useless to attempt to convince those who appear to write rather to support the theories they have adopted, than to assist in arriving at practical correctness, by admitting to fair consideration the result of others' experience. My chief object is to protest against the dogmatical application of any unbending theory, or system, to all cases. Mr. Davis may not have met with any instance of successful draining obliquely to the line of fall, though such are numerous enough to make it matter of surprise that they have escaped his attention, and Mr. Denton may remain convinced that water will only pass through the soil, even if it meets with a drain, in the direction of the steepest line of fall; but practice tells me that there are soils I cannot drain cheaply and thoroughly, without running the minor drains obliquely. I would ask Messrs. Davis and Denton if they have ever met with a soil and substratum of the following character, namely, about 18 inches of stiff loam overlying a stratum consisting of slate, or indurated clay, in laminæ, lying at a considerable angle with the horizontal line, but with their upper edges in the direction of the line of fall; similar to the leaves of a book on its back, as if to be opened. The simile will be almost complete if we suppose the book still closed, but leaning a little on one side, and the top of it slightly elevated, so as to give the face formed by the front edges of the pages the slope of a hill side, with the leaves in the direction of the line of greatest fall. If they can drain such a soil efficiently and economically by laying the drains in the direction of the steepest line of fall, I should be glad to be informed how it is done, and to acknowledge my own error. Mr. Denton is unquestionably right, abstractly, as to the course of water being regulated by the law of gravity, but that natural course is altered by 50 causes in its percolation through soils. If it were not so, the water which lies between the lines of minor drains, when laid up the steepest inclination, would never reach them, but go on till it met with the main drain running across. This beautiful theory, therefore, is defeated when tested practically. Imagine the water lying midway between two drains laid straight down the slope; surely this finds its way across the slope, even through the soil, or else the drains are comparatively useless. In fact it does so notoriously, and therefore proves that it does not always take the line of greatest inclination. As to water escaping in the lower side of oblique drains: with a proper fall this will not be the case, because, with a few exceptions, drains of proper depth run through earth in that state of moisture that renders it more disposed to yield than to absorb water; independent of which it would never leave the easy cylindrical passage it had once obtained, for one through a material it has just left, more difficult of passage, certainly, than the drain itself. There is only one kind of subsoil on which this would occur, and in that the upright would be as subject to it as the oblique drain, namely, where the drains cross deep porous strata, and then, perhaps, the water would be lost altogether, as I have known it to be. I have tested oblique drains in many soils, but I have never found the water to ooze out again on the lower side; nor do I think it will, unless such drains are laid too much across the slope, and in a soil in which oblique drains should not be; and here I may explain, that I seldom lay them at an angle greater than from 10° to 15° from the line of steepest fall. In the foregoing remarks, I must not be misunderstood as advocating oblique drains always; on the contrary, I believe my experience justifies me in stating that in the majority of cases, the plan of pursuing the greatest line of fall should prevail: but this does not prevent me seeing the error of doing so in all cases, without discrimination. *A Draining Engineer.*

Societies.

ROYAL AGRICULTURAL SOCIETY.

A Weekly Council was held on Wednesday, the 22d of February: Mr. Pusey, President, in the Chair.

Nitrate of Soda.—The President read to the meeting the following extract from a letter addressed to him by Mr. Stevenson of Edinburgh:—

February 16, 1854.

Yesterday, Mr. A. Howden, Lawhead, East Lothian, informed me that he had tested his experiment of last crop with nitrate of soda, 1 cwt. of nitrate and 2 cwt. of salt, per imp. acre. The increase of produce was 9 bushels of Wheat per imp. acre. It is only by pressing such experimental results upon the attention of farmers, that will produce a general feeling in favour of this valuable fertiliser.

Mr. Bullen read to the Council the followiug notes on the subject of offal from the cod fishery at Newfoundland.

Fish Offal as Manure.—It appears that about two-thirds say one-half, the cod fish caught is thrown away as waste or offal, so that out of 100 tons of fresh fish you have 50 tons for curing, reduced to 25 tons when dried, and 50 tons of offal. In 1853 there were upwards of 595,000 quintals of dried fish exported from Newfoundland (equal, at 20 quintals to a ton, to about 30,000 tons of cured fish, the produce of 60,000 tons of fresh fish), and 120,000 tons of offal. This offal, at the calculation of one ton to five, ought to give about 25,000 tons of fish manure in a perfectly dried state from cod refuse alone, at present available. As little or no value is set upon it at present, it may be estimated at little more than the price of collection, which, however, would be considerable.

Seal Offal at Newfoundland.—It appears from Governor Hamilton's last report, that there are no less than 367 vessels of from 70 to 180 tons, amounting to 35,760 tons, and carrying 13,000 men engaged in the seal oil and skin trade alone at Newfoundland. About the 1st March this fleet proceeds to sea, and falls in with what is called the "sealing or whelping ice," where the seals breed and rear their young, sometimes on the coast of Labrador, and at others on the shores of Newfoundland itself; and after killing the seals, they strip off the skins, and blubber under the skin, and abandoning the carcases, they stow them in the hold. The voyage lasts about a month or six weeks, on an average, according to the locality where they fall in with the seals, and sometimes ships return fully loaded in a week or a fortnight, while at others the voyage is a total failure. "Last season, which was considered a most disastrous one to the shipping, there were 550,000 seals killed, from which 7334 tons of oil were extracted, amounting to 237,957*l.* sterling, or near 30*l.* per ton, and seal skins to the value of 76,790*l.* sterling also exported." The bodies of these seals, which constitute their chief bulk, must have given 50,000 tons, at least, of animal matter. In addition to these sources of the raw material the seas and bays round Newfoundland abound with fish of every kind, particularly the capelin, as it is called, a species of small sprat, upon which the cod fish live, together with the dog fish, and others which are peculiarly rich in oil, and can be taken in great quantities by the slightest exertion, or the adoption of improved machinery and system. The chief difficulty to a successful manufacture is the want of labour, which is dearer at certain seasons in Newfoundland, and more scarce than anywhere else, as there are only 120,000 inhabitants in the island, and they are so exclusively occupied in the fishing and sealing seasons, in summer and spring, that they cannot attend to anything else. But Governor Hamilton, in his excellent report, most judiciously remarks, that "unfortunately in that colony there is little or no employment for the labouring population during the long period which intervenes between the close of the cod fishery in summer, and the commencement of the seal fishery in spring," and that in the mode and processes of conducting the fisheries themselves, there is a great want of economy and a disregard for improvements which the application of modern science would suggest, and which might be rendered available in advancing the industrial pursuits of the colony." In conclusion, he says "that there are few parts of the world where the process of converting labour into capital is so speedy, or, for the extent of it, so efficacious as at Newfoundland. If the catch of seals alone be an average one, upwards of 300,000*l.* is raised off these 'sealing meadows,' as they are called, in a few weeks. The sea in this brief season yields a harvest more profitable than the plain, and without the labours of a seed time, too." He also remarks that, "since the abandonment of the deep sea fishery on the banks, the cod fishery is now confined to small boats on the coast and in the bays and harbours, and could hardly be carried on without the aid of the seal fishery;" but how vastly would the whole community be benefited by utilising the entire of the produce of both fisheries, in the combined manufactures in question. It is evident that the manufacture cannot be carried on effectively and profitably either at Newfoundland or elsewhere, except by commanding the raw material to an indefinite amount, and at a nominal price, or the price of collecting it. In the cases mentioned, large quantities are now procured for other objects, and wasted, and it is well worthy of consideration how far the increased demand for the article, and the enterprising spirit combined with the science and machinery of the present day, might not have the effect of establishing a new and profitable trade in this colony, and of utilising the whole animal supply, and of combining the present curing of cod fish, and the cod liver and other oil trades, directly with the manufacture of manure from the refuse. But to effect this, it is evident that the capital, machinery, and skill must be chiefly supplied from this country. Suggestion,—That a series of experiments should be instituted in this city under the immediate superintendence of the Society and at their expense, for the purpose of ascertaining the best modes of manufacturing the manure. For that purpose that a couple of tons of ordinary fish offal should be procured at Billingsgate or elsewhere to experiment on, and to ascertain the exact and relative proportions and prices of the oils, and manure, &c., whether made by simple desiccation or by the action of acids, so as to become thoroughly acquainted with the process, and to suggest such alterations as may be advisable for establishing the system elsewhere.

The reading of this communication was followed by an interesting discussion on this and some other proposed substitutes for guano, in which the President, Mr. Raymond Barker, Mr. Fisher Hobbs, Mr. Cuthbert Johnson, Dr. Calvert, Mr. Caird, Professor Way, Mr. Mainwaring Paine, Mr. Nicol, Mr. Slaney, Mr. Bullen, and Mr. Pocock took part.

Mr. Harkness, Secretary to the Royal Agricultural Improvement Society of Ireland, favoured the Council with a supply of several copies of the last Journal of that Society, containing the papers of Dr. Apjohn on the subject of fish manures, recently read before its members.

Sheep-Shearing.—Mr. Caird submitted to the inspection of the Council one of the new instruments for shearing sheep, invented by Mr. Henry Francis, of West Strand, London; along with testimonials of its value. Professor Simonds expressed his approval of the instrument in question.

The Council having ordered their usual acknowledgments for the communications then made to them, adjourned to their monthly meeting, on Wednesday next, the 1st of March.

Notices of Books.

Appendix to the Specification of English Patents for Reaping Machines. By Bennet Woodcroft. Eyre & Spottiswoode.

Probably there is no single field implement whose history is a more accurate counterpart to that of agriculture itself than the reaping-machine. Both its early history, commencing long enough ago, and its later history, displaying sufficient rapidity and energy of progress, attest the truth of this remark. Just as in the writings of Pliny and Palladius we find agricultural maxims and instructions which are still quoted by the agricultural teachers of the 19th century; so there, also, we find notices of a reaping-machine, which it was proposed in 1785 should be revived in competition for the prize then offered by the Society of Arts in connection with the subject. And as to the more recent course of English farming, we find that, with the ebb and flow of agricultural excitement, there has all along been a corresponding amount of attention devoted to this particular means of cheapening the cost of agricultural production.

The work of Mr. Wooderoft just published under the sanction of the Commissioners of Patents is a most interesting illustration of this point. It appears from it that since 1849 no fewer than 32 patents have been taken out either for original machines or for improvements upon Bell, Hussey, and M'Cormick; of these, one is for a cutter worked by hand, one for a simply advancing edge, one on the sidelong and advancing principle, 16 on the reciprocating and advancing principle, and 14 on the principle of circular motion. Thus within 4 years of agriculturally the most active portion of English history, more than one-half of all the patents in connection with the subject have been taken out, although the list commences with the year 1786.

This corresponds to our general knowledge of the excitement which has prevailed upon the subject ever since the exhibition of American reapers in the Crystal Palace. And the particulars which may be gathered in detail from the perusal of Mr. Woodcroft's work furnish a sufficiently precise succession of illustrations

of the point. We have not room at present to give anything like even a mere epitome of the history here furnished us, and must be, therefore, satisfied with commending the work, along with the article on his own invention by Mr. Bell, of Carmylie, in the current number of the "Edinburgh Quarterly Journal of Agriculture," to the attention of all who may be interested in this now important branch of agricultural history.

Poultry.

POULTRY: *A Z.* The hen is suffering either from an injury in the back, or from a stoppage; in either case, the best possible treatment will be a tablespoonful of castor oil. It may arise from a difficulty in laying; if so, I would advise the introduction of a feather, saturated with oil, into the egg passage; the relief will be immediate. The more oil introduced in this manner the more speedy and effectual the cure will be.—*C H.* I would advise the removal of the lump from the ear-lobe of the Spanish cock, if other means have been tried; if they have not, wash it well, and foment with warm water, and rub with compound sulphur ointment. Should this fail, remove it carefully. As it often happens that any injury to the white skin of the Spanish fowl leaves a red mark, and thereby injures the bird for exhibition purposes, the incision for the removal should be as small as possible, and made underneath, so that the white skin may be brought down to cover it.—*O.* Perhaps your old Cochin cock is merely suffering from old age; if so, I cannot offer a remedy; if, however, it is not so, I would advise you to give him a tablespoonful of castor oil, and after feed on stimulants, as bread, ale, &c. Should these fail, try some of the many medicines now advertised for poultry, and extensively used. *J. Baily*, 113, *Mount Street.*

Calendar of Operations.

FEBRUARY.

RHINS OF GALLOWAY, *Feb.* 21.—After the rough winter we have had, we may look for an early and genial spring, which will be much needed, as the fodder and Turnips for stock will, in many cases, be prematurely exhausted. The autumn and winter sown Wheat has been much retarded in its growth by the severe frost; still it seems to be well planted, and with favourable weather it may not be much the worse for the check it has received. The spring sowing of Wheat has been proceeded with when the weather has suited; there is still a considerable breadth to sow, as some farmers in different localities of the district prefer spring to autumn sowing. Our experience has been the reverse of this, as we have generally one-third more in quantity, and of far better quality sown in autumn than spring. This year our produce was 36 bushels per Scotch acre, all sown in November, December, and beginning of January; whereas, for the two previous years our average per acre of that sown in spring on fully as good land, was only 25 bushels. Grain has been freely threshed out, owing to the high prices, and consequently there is less in the farm-yard than usual at this time of year, which will tell on our further home supplies. There has been a considerable reaction in the grain market during the last three weeks Feeding cattle have been thriving and paying well, though prices have been of late tending downwards. This has been a very unfavourable season for sheep on Turnips, still wethers have been selling at high prices, leaving fair remuneration for keep, wether mutton being now worth 8*d.* per lb. in the Glasgow market. Farm labour is pretty well advanced, despite the rough winter; labourers are well employed at good wages, and there need be no idle hands where there is a willingness to give a fair day's work for a fair day's pay.

THE LAMMERMUIRS.—Black weather and frequently very hard frosts. This month and next are the most severe months in all the year on hill stock, even although the weather remain open, because the pastures are now thoroughly dead and withered up. The storm with which this year set in lasted with considerable severity for three weeks, when the hay reserves were largely drawn upon, so much so that many stock farms had not more than another week's provision left when the storm gave way. Last summer was a particularly hard Grass season, so that much less hay was attained than is usually deemed sufficient to face the winter with, and any accumulation of former years was completely swept away by the severe storm of last year. Should another storm set in, and be of any continuance, very heavy losses may be expected. As yet the stock in this district have stood the winter so far as it has gone much better than last year. In this district the shepherds are usually engaged for another year on or before Candlemas-day; their wages are paid partly in sheep and partly in corn or meal, also a cow's Grass and Potatoes are allowed them. *Lammermuir.*

Notices to Correspondents.

DR. NEWINGTON'S DIBBLE, &c.: *A Sub.* Dr. Mackenzie can apply to Mr. H. Ben, of Lamberhurst, Sussex, who makes them.

GYPSUM: *Hy.* It should be applied now. All easily soluble manures are as well or better applied during the time of growth, but difficultly soluble substances may be applied earlier.

IODINE: *A Sub.* Will you point out the paragraph to which you allude?

ITALIAN RYE-GRASS: *Old Subscriber.* At least 3 bushels per acre. This will be from 45 to 50 lbs., and you should not sow less.

MANGOLD WURZEL, &c.: *Cliviger.* A doubly-trenched loam in a moist climate will do very well for growing prize roots. You had better incorporate 10 or 12 tons of farm-yard manure per acre, and then apply 3 cwt. of guano and 2 cwt. of common salt over the land before ribbing it for the reception of the seed: In the case of Swedish Turnips, 2 or 3 cwt. of superphosphate should be applied per acre in addition.

NITRATE OF SODA: *M H.* Both it and salt may be dissolved in liquid manure, and carefully applied as a top-dressng to Wheat and pasture in spring.

PASTURE: *Hy.* A compost of vegetable matter with gypsum and guano applied in such quantity as to contain 2 cwt. apiece of the two substances per acre, will be as good a dressing as you can give.

POTATOES: *J S F.* We hardly know what kind and condition of soil you have to deal with; but if it be a mass of well-rotten turf, we should fear the application of nitrogenous manure as likely to induce excessive luxuriance of growth. If any nitrogenous manure be adopted, soot (20 to 30 bushels per acre) would probably be as good as any. If you apply bones and nitrate of soda—2 cwt. of the former, with ½ cwt. of sulphuric acid (see page 76), and 1 cwt. of nitrate of soda, will make a good dressing per acre.—*Rus.* The district growing Potatoes of the best quality we know, has a calcareous soil. We do not acquiesce in the statement that "lime is injurious to Potatoes."

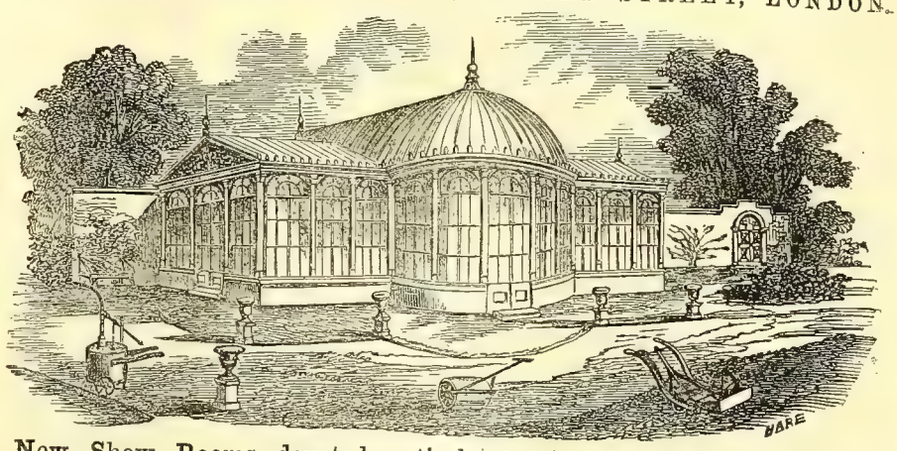
REFUSE FROM ALKALI WORKS: *G P.* We do not know what it is, and therefore cannot say what it will do. If you would state of what particular process it is the refuse, it might be possible to give an opinion.

ROOKS: *R A H.* You can drive them away with powder and shot; and as to their nests, though you cannot climb to remove them, a little ingenuity will lodge a string by which they may be pulled away.

WATER-POWER: *W H C.* We remember not only receiving your letter, but also writing a reply, which, however, we do not find in any of the past numbers. The answer gave an unhesitating preference to water-power, as at once the cheapest and most manageable of any at the farmer's command.

COTTAM AND HALLEN,

2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.



New Show Rooms devoted entirely to Articles of Horticulture.

ILLUSTRATED CATALOGUES UPON APPLICATION.

Conservatories	Mowing Machines	Hand-glass Frames	Garden Engines	Flower Sticks
Greenhouses	Fountains	Game Netting	Do. Syringes	Garden Bordering
Hot Water Apparatus	Ornamental Wire Work	Hurdles	Do. Rollers	Watering Pots
Garden Vases	Flower Stands	Garden Chairs	Flower Labels	Garden Arches, &c.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.

AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

CHEAP WIRE GAME & POULTRY NETTING, 5*d.* per running yard.

GALVANISED DITTO, 7*d.* per running yard, 2 feet wide.

	Galvanised.	Not Galvanised
24 in. wide, 2 in. mesh,	*d.* per yard.	5*d.* per yard.
30 in. " 2 in. "	9*d.* "	6½*d.* "
36 in. " 2 in. "	10½*d.* "	7½*d.* "
48 in. " 2 in. "	1*s.* 2*d.* "	10*d.* "

Sparrow Proof Netting, Galvanised, 3*d.* per square foot, made to any size for the same proportionate price. This article was shown at the Great Exhibition, where it was so much admired for its light and durable appearance, and acknowledged to be the cheapest and best article of the kind ever offered. Extra strong Wire Sheep Netting, 3 feet high, 1*s.* 6*d.* and 2*s.* 3*d.* per yard. Also every description of Flower Trainers, Dahlia Rods, Garden Arches, Bordering, Flower Stands, Tying Wire, Trellis Work, Invisible Wire Fencing, Hurdles, and every description of Wire Work for Horticultural purposes.—Illustrated Catalogues of Patterns forwarded, post free, on application to T. H. FOX, City of London Wire Work and Iron Fence Manufactory, 44, Skinner Street, and 6 and 8, Snow Hill, London.

GALVANISED WIRE GAME NETTING.—7*d.* PER YARD, 2 FEET WIDE.

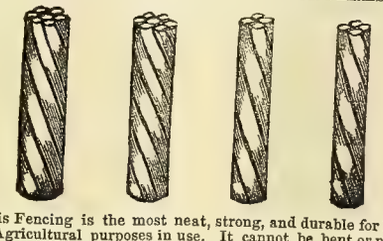
	Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide	... 7*d.* per yd.	5*d.* per yd.
2-inch " strong "	... 9 "	6½ "
2-inch " extra strong "	... 12 "	9 "
1⅝-inch " light "	... 8 "	6 "
1⅝-inch " strong "	... 10 "	8 "
1⅝-inch " extra strong "	... 14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich; and delivered free of expense in London, Peterborough, Hull, or Newcastle.

H. J. MORTON AND CO., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.

PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

TANNED GARDEN NETTING for protecting Fruit Trees from frost, blight, and birds, or as a fence for fowls, pigeons, Tulips, and seed beds, can be had in any quantity from JOHN KING FARLOW'S, Fishing Tackle and Net Manufactory, 4 and 5 Crooked Lane, London Bridge, at 1½*d.* per yard one yard, 3*d.* two yards, or 6*d.* four yards wide. Carriage free on all orders over 20*s.*, accompanied by a Post Office order, or London reference. Rabbit, Sheep, and Fishing Nets of every description in stock or made to order.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, 17, Smithfield Bars; City, and Old Kent Road, Southwark, where may be seen erected Emigrant Tents in great varieties, on their latest improved principles, and also at Brunswick Street, Poplar near the East India Export Dock.

WIRE FENCING, 6¾*d.* per Square Yard, in various widths from 6 feet to 15 inches, mesh less than 2 inches. An effectual fence against Hares, Rabbits, Sheep, Deer, &c., and for the enclosure of Poultry, Pheasants, &c.; 4 inch mesh. 4*d.* per square yard.—R. RICHARDSON, 21, Tonbridge Place, New Road, London.

BLOSSOM OF FRUIT TREES.—WORSTED NET to effectually protect the blossom of wall fruit trees from frost and blight, and the ripe fruit afterwards from wasps and flies, 7*d.* per square yard, in various widths. All kinds of garden, fishing, and sheep nets, made by machinery, and at very low prices. —R. RICHARDSON, 21, Tonbridge Place, New Road, King's Cross.

FRUIT TREES, POULTRY, RABBIT, SHEEP, and CAT FENCING.—Worsted Netting to protect the Bloom of Peach, Nectarine, and other Trees, Flower, or Seed Beds, from Frost, Blight, and Birds, 2 yards wide, 6*d.* per yard NEW TWINE NETTING (Tanned if required), 1 yard wide, 1½*d.* per yard; 2 yards wide, 3*d.* per yard; 4 yards wide, 6*d.* per yard; Half-inch Mesh ditto, 2 yards wide, 6*d.* per yard TANNED NETTING, 2 or 3 yards wide, 1½*d.* per yard; 4 or 6 yards wide, 3*d.* per yard; or 5*s.* per 100 yards, 1 yard; 10*s.* per 100 yards, 2 yards; and 20*s.* per 100 yards, 4 yards wide. ELASTIC HEXAGON GARDEN NET, or Scrim Canvas, 4½*d.* per square yard. COCOA NUT FIBRE, or Hemp Sheepfolding Net, of superior quality, 4 feet high, 4*d.* to 6*d.* per yard. Rabbit Net, 4 feet wide, 1½*d.* per yard; 6 feet wide, 2¼*d.* per yard; 8 feet wide, 3*d.* per yard. Each Edge Corded, ½*d.* per yard extra, suitable for Poultry Fencing. Square Mesh Cricketing Net, fix its full width and length, made of stout cord, 3*d.* to 4*d.* per square yard; this is the best article made for fencing, against fowls, cats, &c., at W. CULLINGFORD'S. Orders by post with post-office order or town reference, punctually attended to. The Trade supplied. Fishing Nets of all kinds in stock. Nets made to order. Tents, Marquees, Rick Cloths, Tarpaulin, Lines, Rope, Twine, &c., made to order.—1, Edmund-terrace, Ball's Pond Road, Islington, London.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

PRIZE MEDAL—1851.

AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON and BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40*s.* Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1 and 2, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s.*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges.

1st,—From the frequency and extent of his purchases; and,

2dly,—From those purchases being made exclusively for cash.

THE PERFECT SUBSTITUTE for SILVER.—The real NICKEL SILVER, introduced 20 years ago by WILLIAM S. BURTON, when Plated by the patent process of Messrs. Elkington & Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either usefully or ornamentally, as by no possible test can it be distinguished from real silver.

	Fiddle Pattern.	Thread or Brunswick Pattern.	King's Pattern.
Tea Spoons, per dozen	18*s.*	26*s.*	32*s.*

CUTLERY WARRANTED.—The most varied assortment of TABLE CUTLERY in the world, all warranted, is on Sale at WILLIAM S. BURTON'S, at prices that are remunerative only because of the largeness of the sales; 3¼-inch ivory-handled table knives, with high shoulders, 11*s.* per dozen; desserts to match, 10*s.*; if to balance, 1*s.* per dozen extra; carvers, 4*s.* per pair; larger sizes, from 14*s.* 6*d.* to 26*s.* per dozen; extra fine, ivory, 32*s.*; if with silver ferrules, 37*s.* to 50*s.*; white bone table knives, 7*s.* 6*d.* per dozen; desserts, 5*s.* 6*d.*; carvers, 2*s.* 3*d.* per pair; black horn table knives, 7*s.* 4*d.* per dozen; desserts, 6*s.*; carvers, 2*s.* 6*d.*; black wood-handled table knives and forks, 6*s.* per dozen; table steels, from 1*s.* each. The largest stock in existence of plated dessert knives and forks, in cases and otherwise, and of the new plated fish carvers. Also a large assortment of Razors, Penknives, Scissors, &c., of the best quality.

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares), Iron and Brass Bedsteads, so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); Nos. 1 and 2, Newman Street; and 4 and 5, Perry's Place.

WANTED, A FARM.—To rent, from Michaelmas next, or Lady Day, 1855, a Farm of from 100 to 200 acres, with a good House fit for the residence of a gentleman with a small family; within six hours of London by railway, and near a station and town.—Apply by letter, with fullest particulars, to C. C., 66, Mark Lane, London.

TO BE LET, for a Term of 3, 7, or 14 years, Two GREENHOUSES, one large and one small, heated with hot water, well stocked with young Vines, with one or two acres of Ground, if required, suited for Flower-roots.—Apply at Ebenezer Cottage, Sherwood Farm, Mitcham Common, Surrey, nine miles from the markets.

GREENHOUSES AND PUBLIC-HOUSE.

To Gardeners, Florists, and Others.

TO BE LET, in the immediate neighbourhood of Gravesend, a large Greenhouse, Propagating-house, and a Range of Brick Pits; also a PUBLIC-HOUSE adjoining the same. The Stock of Plants to be taken at a valuation.—Particulars may be obtained of Mr. J. GOULD, 38, Windmill Street, Gravesend, Kent.

TO BE SOLD, at Chapel Farm, Eltham, ASH-LEAF KIDNEY and FORTY-FOLD POTATOES for Seed.—H. J. HAMMOND.

PHEASANTS.

TO BE SOLD, in one or more lots, Thirty HENS, Six COCKS, and one Brace of White ones, the property of a gentleman. 80 miles from town.—C. C., Office of this Paper.

FANCY POULTRY.

J. R. FORD, Ampthill, Beds, has a few EGGS from his White Game Fowls for Sale, at 12*s.* the dozen. His birds are from a first-rate strain.

AYLESBURY DUCKS' EGGS.

TO BE SOLD, EGGS warranted from the best selected White Ducks, good shape, bill and legs fine and a good colour, 6*s.* per dozen, including packing. Early application to secure them at the above price is necessary.—Apply to WILLIAM HENRY GREEN, Builder, Walton Street, Aylesbury.

EGGS.

MR. PEARSON will supply a sitting of 13 Eggs of the Spotted Dorkings, Gold Pencilled Hamburghs, Gold Spangled do., Silver Pencilled Hamburghs, Silver Spangled do., for 5*s.* each sitting, including package. His Gold Pencilled Hamburghs won the 1st Prize at Birmingham in 1852, and 2d Prize in 1853; the Silver Pencilled won the 1st Prize in 1853 at Birmingham. The Gold Spangled Hamburghs being out at walk, letters for them must be addressed Mr. W. HETLEY, Orton, Peterborough.

The other varieties are kept at Chilwell, near Nottingham.

TO BE SOLD, BUFF COCHIN CHINA EGGS, from Birds that have taken prizes at the Derby, East Kent, Bristol, Taunton, and Yeovil Poultry Shows, at 1*l.* 1*s.* per dozen; also Partridge Cochin China Eggs, from Birds that have taken prizes at London Summer Meeting, Surrey Gardens' Show in August, Malvern, Yeovil, Honiton, and Torquay Poultry Shows, at 1*l.* 1*s.* per dozen.—Apply to JOHN R. RODBARD, Aldwick Court, Wrington, near Bristol.

EGGS FROM PURE BRAHMA POOTRA AND WHITE-FACED BLACK SPANISH FOWLS.—A few sittings from the first-named splendid birds can be engaged. The hens are from an importation of Dr. Bennett's celebrated stock, and the cockerels from her Majesty's aviary; all very heavy, and beautifully marked. Price per dozen, 2*l.* 2*s.* The Spanish are most choice birds, from the first stock in the world, no expense having been spared to procure the best blood. Price per dozen, 12*s.* All the birds may be viewed upon application. Orders will be attended to according to priority, and will be packed with all possible care.—Address to A. B., The Grove, Catton, Norfolk.

FANCY POULTRY AND EGGS.

Holme Cottage, Louth.

GEORGE BOOTHBY offers for the season every variety of the above, of qualities not to be surpassed. He has taken prizes at every show at which he has recently exhibited, including Hitchin, Leeds, Doncaster, Manchester, &c. A few very choice Buff Cochins, at 5 Guineas the pair; good ones, from 1 Guinea; Black and White do., 4 Guineas; good useful ones, 2 and 3 Guineas; Gold, Silver, and White Polands, from 2 to 4 Guineas; White-faced Spanish, from 3 to 5 Guineas; a few Dorkings, 7*s.* 6*d.* each. Eggs of Spanish, also of Black, White, and Buff Cochins, from prize birds, at 1 Guinea the dozen; Dorking Eggs, 7*s.* 6*d.* the dozen; a few eggs from Buff, Black, and White Cochins, crossed by Black, White, and Brahma Pootra Cockerels, 10*s.* 6*d.* the dozen; these will produce some very fine birds. A few pairs of real Chinese Silver Pheasants, on sale.

FANCY POULTRY.

EDWARD H. STRANGE, Ampthill, Beds., has for sale a few pairs of the following birds:—Black Spanish, from Captain Hornby's strain; Two Hen Birds obtained 1st, 2d, and 3d prizes at the Bedford Exhibition, 1853; Golden Pencilled Hamburgh and White-bearded Polands, first prizes were awarded to each of these varieties at the Hitchin and Home Counties Exhibition 1853; White and Buff Shanghaes, fine heavy birds; Silver Spangled Hamburgh, these birds gained a prize at the Bedford Exhibition.

E. H. S. will have a few sittings of Eggs from each of the above Fowls to sell, and from the Staffordshire pile Game, from birds that took a prize both at Hitchin and Bedford. Price, and other particulars, sent on receipt of a directed envelope.

LIGHT BUFF COCHIN CHINA FOWLS' EGGS.—An Amateur having a first-rate stock of Light Buff Cochin China Fowls from Prize Birds, and more eggs than he requires for his own use, is willing to part with a few sittings at a reasonable price—5*s.* 6*d.* per doz., box included.—Address "Chanticleer," Post-office, Farnham, Surrey.

TO POULTRY FANCIERS.—Gentlemen wishing to improve their stock of Buff Cochin Chinas have an opportunity rarely offered of purchasing some truly splendid Birds. Bred exclusively from a pair of Thos. Sturgeon, Esq.'s., best Birds, the Hen weighing nearly 10 lbs., and remarkably heavily feathered. All the Birds now offered are of great weight, and exceedingly heavily feathered, and short thick legs.—May be viewed on application to A. HORNCASTLE, Grays, Essex. Eggs at 20*s.* per dozen. All communications to enclose a stamped envelope.

TO BE SOLD, PRIZE PARTRIDGE SHANGHAES.—Two Cockerels and Two Pullets, birds which took first prizes at Surrey Winter Show, first prize at Bedford, also prizes at Norwich and Great Metropolitan Show. The Cockerels are Black-breasted, the Pullets beautifully marked. Price on application.—Also EGGS from Partridge Coloured Prize Birds at 20*s.* per dozen.—J. F. CHATER, Haverhill, Suffolk.

MR. GILBERT, of Grays, Essex, having entered into an arrangement with THOMAS STURGEON, Esq., for the Purchase of the whole of his remaining Stock of COCHIN CHINA Fowls, bred by him in 1853, Gentlemen and Amateurs are informed the Birds are now on Sale. Eggs may be had from the above birds at 20*s.* per dozen.

Sales by Auction.

FANCY POULTRY.

MR. J. C. STEVENS'S next periodical Sale by Auction will take place on TUESDAY, 7th March, at 12 o'clock precisely, at his Great Room, 38, King Street, Covent Garden. The BRAHMA POOTRAS are many of them very choice, and include a Hen, first prize Metropolitan last January. The COCHINS and COLOURED are also well deserving attention, the contributors being H. Gilbert, Esq., Rev. Mr. Papillon, Mr. Gibbs, Mr. Collinson, and several other first-class breeders.—Catalogues by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

MR. CYRUS CLARK'S CHOICE FANCY POULTRY. EXTRA SALE.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, March 14, at 12 o'clock precisely, a selection from the yard of Mr. Cyrus Clark, of Street, Glastonbury; it includes COCHINS, chiefly light pure Sturgeon and Andrews. The Whites, from Mrs. Herbert's stock. Spanish, Silver Polands, and coloured Dorkings, many of which are prize birds at Dorchester, Yeovil, Bristol, Taunton, Torquay, Honiton, and the Surrey Zoological.—Catalogues, by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden, London.

MRS. LYDIA C. STOW'S SPANISH, BUFF & BLACK COCHIN CHINA, & COLOURED DORKING FOWLS.

MR. J. C. STEVENS has received instructions to Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, Feb. 28th, at 12 o'clock precisely, upwards of 150 LOTS of CHICKENS of 1853, including many prize and commended Birds of the above varieties, all bred by Mrs. Stow. The SPANISH FOWLS, consisting of about 40 Lots, include Birds which took 1st Prizes at Malvern, Southampton, and Birmingham, and are the progeny of her noted Bird CHAMPION, the winner of the 1st Prize at the summer Surrey Zoological Show, and will be the first she has parted with this season. The COCHIN CHINA CHICKENS were bred from Birds which have lately taken Prizes at Liverpool and Manchester. Aylesbury Ducks from 1st Prize Birds, &c.—Catalogues by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

HILL'S COURT, EXETER.

Unreserved Sale.

MR. G. A. MOORE has been favoured with instructions to Sell by Auction, on WEDNESDAY, March 1, the whole of the valuable GREENHOUSE PLANTS, Indian Azaleas, Roses, Greenhouse, Pit and Box Frames, Garden Engine, Flower Stands, &c.; also, Six very fine COCHIN FOWLS, the property of F. Hernaman, Esq., who has left Exeter. The taste and skill with which Mr. Hernaman has collected and cultivated his plants is so well known that it is almost needless to allude to it; it is sufficient to say that amongst the Greenhouse Plants will be found many splendid specimens. Sale to commence at 11 o'clock precisely.—Catalogues may be had at 6*d.* each, to be returned to purchasers, on Friday and Saturday previous to the Sale, of Messrs. LUCOMBE, PINCE, & Co., Exeter Nursery; and of the Auctioneer, Defender Fire and Life Insurance Office, 71, Paris Street, Exeter.—Feb. 25.

VALUABLE NURSERY STOCK OF FOREST AND FRUIT TREES, EVERGREENS, ETC.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

ALFRED KENT'S PATENT WEATHER-PROOF GLAZING WITHOUT PUTTY.—For Horticultural Buildings in Wood or Metal.

HORTICULTURAL BUILDING WORKS, CHICHESTER.

Illustrated Books describing inventions, containing prices and particulars relating to the different designs, sent on receipt of four postage stamps. Nurserymen and others appointed agents on application.

Horticultural Buildings upon this plan having been erected in many different parts of the country, and having stood the trial of all weathers, and more especially the severest of all, viz., frost, A. KENT, with full confidence, strengthened by the many flattering testimonials he has received, can safely guarantee the proper working of his Patent System of Glazing. Estimates and Plans sent, including Heating by Hot Water.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

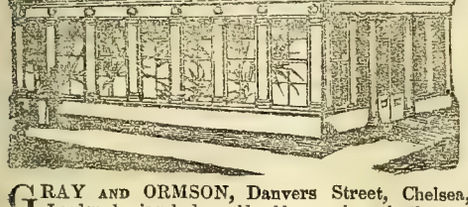
Priced lists of plant tubs and boxes forwarded on application.

HORTICULTURAL BUILDINGS, ROCK AND RUSTIC WORK, ORNAMENTAL WATER, FOUNTAINS AND FALLS, AND LANDSCAPE GARDENING, executed on the best principles; Estates Improved, Land Laid Out for Building, &c., by Mr. GLENNY, Valuer, Estate and Horticultural Agent, 420, Strand.

GREEN AND HOTHOUSES made by machinery at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Warranted of best materials; being made by steam-power, they are put together in a superior manner; one trial will prove these Buildings to be the cheapest and best made in England. 1½ in. Greenhouse lights at 3*d.* per foot; 2 in. at 4½*d.* per foot. Lists of Prices by enclosing two postage stamps.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

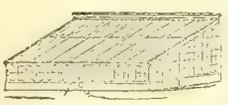
HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

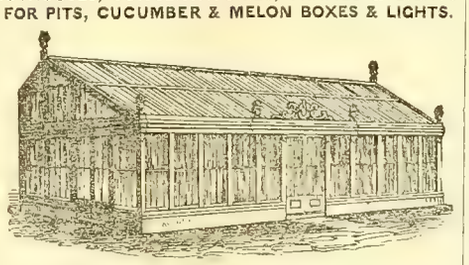


The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.



JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in. 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

SUBSTITUTE FOR GARDEN MATS.—Waxed Sheeting nearly 2 yards wide, 1*s.* per yard run—admits light and excludes cold; Thick Canvass Tarpauling, 1*s.* per square yard; Thick Canvass Waxed Sheeting, 1*s.* per square yard, may be had various widths; these Canvasses are excellent for Roofing Sheds and Outhouses, as they are quite Waterproof.

R. RICHARDSON, 21, Tonbridge Place, Judd Street, New Road, London.

EMIGRANTS' IRON AND WOOD HOUSES from 10*l.* each; Drawings of 21 Houses sent free. Also maker of Iron and Wood Summer Houses for Gardens. Portable Poultry Houses, Pheasantries, &c.—R. RICHARDSON, 21, Tonbridge Place, New Road, near King's Cross, London.

KNOW THYSELF!—Professor BLENKINSOP continues to receive from individuals of every rank the most flattering testimonials of his success in describing the CHARACTERS of Persons from their HANDWRITING, pointing out their mental and moral qualities, whether good or bad.—Address by letter, stating age, sex, and profession, inclosing 13 uncut postage stamps, to Dr. BLENKINSOP, 344, Strand, London.

THE POTATO DISEASE.

FRESSON'S "ANTI-POTATO BLIGHT" is a certain and sure remedy for the above. To insure a sound and healthy crop, dress your "SEED POTATOES," before sowing them, with the above.—Sent free (on receipt of 13 uncut postage stamps) with easy directions for use. Also, remarks upon the best soils for Potatoes; by FRESSON, Agricultural Chemist, Stevenage, Herts.

CURE FOR MILDEW ON GRAPES, &c.—In consequence of the increased prevalence of mildew on the Vines, &c., during the last few seasons, G. TABER, of Rose Cottage, Rivenhall, practical Gardener, Seedsman, and Florist, has directed particular attention to the best mode of preventing it, or for curing the Vines that have been attacked, and he now begs to announce that he has succeeded in preparing a composition known as TABER'S ANTI-MILDEW COMPOSITION, which will effectually prevent or cure the disease without doing the slightest injury to the Vines; and any person, by the aid of the printed instructions, may use it without risk. It is also an invaluable remedy for preventing Mildew on Wall Trees, Roses, &c. Sold in packets containing 1 lb., 1*s.* 3*d.*; 3 lbs., 3*s.*; 6 lbs. 5*s.* 6*d.*, with directions for use. By enclosing two postage stamps, G. T. will send a circular with full particulars as to quantity required for a house for the season, and also testimonials of the success he has met with.

G. T. will personally attend gentlemen, and give instructions to their gardeners at a reasonable remuneration for time and travelling expenses. The trade supplied at the usual discount. Post Office orders to be made payable to GEORGE TABER, and drawn upon the Witham Post Office. Postage stamps received in payment of small orders. Packets delivered free to the Witham Station of the Eastern Counties line.—Address GEORGE TABER, Rose Cottage, Rivenhall, near Witham.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

BAILY'S ROUP AND CONDITION PILLS FOR POULTRY.—This remedy has been extensively tried with uniform success, and is offered to amateurs and the public with the greatest confidence. It will effectually overcome that disease which has hitherto been the bane of the poultry-yard, and destroy that apprehension known to all poultry keepers, when a favourite and valuable fowl is seen to droop. It is inestimable for poultry returning from exhibitions, and greatly facilitates moulting.—Sold, with full instructions for use, in boxes containing 50 pills, by JOHN BAILY, 113, Mount Street, Grosvenor Square, price 3*s.* per box, or by post 3*s.* 4*d.* "Fowls, by Baily," the most useful and plainest treatise of the day; price 2*s.*, by post 2*s.* 6*d.*

Baily's Registered Fountains, universally adopted and approved. Drawings and particulars, by post, on application.—113, Mount Street, Grosvenor Square.

GREAT SAVING OF TIME AND MONEY.

R. RESTELL'S PATENT ECONOMICAL GAS APPARATUS for Forcing Houses, Greenhouses, Conservatories, Pits, Shops, Counting Houses, Warehouses, Drying Rooms, &c. &c., possessing all the advantages of Hot Water at half the expense of fitting, and most trifling cost for Gas, far surpassing any ordinary Gas Stove, requiring no furnace, and allowing of no fumes or evaporation in the Building, or possibility of accidents from negligence or carelessness. It has been tested through the late severe weather, on a variety of Plants, and found most satisfactory. It is very quickly fitted up and requires no night attention.—Apply to the Inventor and Patentee, R. RESTELL, 35, High Street, Croydon, Surrey.

Persons wishing to have Houses fitted will please to send the height and dimensions.

THE COTTAGER'S STOVE.—An economical, compact, and portable COOKING APPARATUS, combining a good sized Oven and Hotplate; may be had with or without a boiler, and will cook sufficient for a dozen persons with the consumption of 1 lb. of coal or coke per hour. It requires no fixing, may be placed in any apartment, and is a great security against accidents from fire. It will burn Coal, Coke, or Wood. They are also specially adapted for Emigrants, and may be seen in operation daily, at the Manufacturers', D. & E. BAILEY, 272, High Holborn, London.—Price 50*s.*, and upwards.

WM. HALSE'S FIVE GUINEA APPARATUSES are now ready.—Invalids are solicited to send to Mr. W. HALSE, of 22, Brunswick Square, London, for his Pamphlet on MEDICAL GALVANISM, which will be forwarded free, on receipt of two stamps. In it will be found the particulars of cures in cases of asthma, rheumatism, sciatica, tic douloureux, paralysis, spinal complaints, headache, deficiency of nervous energy, liver complaints, general debility, indigestion, stiff joints, nervous disorders, &c. Mr. HALSE'S method of applying the galvanic fluid is quite free from all unpleasant sensation. Terms: One Guinea per week. The above Pamphlet contains his Letters on Medical Galvanism.

HOLLOWAY'S OINTMENT, A SOVEREIGN REMEDY FOR THE AFFLICTED.—The number of years this invaluable Ointment has stood the test of public opinion, and the longer known the better appreciated, is a testimony of itself more powerful than anything that could be written in praise of the curative properties which it possesses. For Ringworms, Scald Heads, and all diseases of the Skin it is unequalled; recent tumours or old ulcers may very shortly be healed by its use. For Tumours, Bad Breasts, Scrofula, and Sore Legs, there is no remedy to be compared with it; and in conjunction, as a purifier of the blood and to effect certain cures, HOLLOWAY'S PILLS should be taken.—Sold by all Druggists; and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

PAINS IN THE BACK, GRAVEL, LUMBAGO, RHEUMATISM, GOUT, INDIGESTION, FLATULENCY, NERVOUSNESS, DEBILITY, &c.

DR. DE ROOS' COMPOUND RENAL PILLS, as their name Renal (or the Kidneys) indicates, are a most safe and efficacious remedy for the above dangerous complaints. For depression of spirits, incapacity for society, study, or business, giddiness, drowsiness, nervousness, and insanity itself, when arising from or combined with urinary diseases, they are unequalled. Price 1*s.* 1½*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 11*s.*, and 33*s.* per Box, through all Medicine Vendors, or sent (free) on receipt of the amount in postage stamps, by Dr. DE ROOS, 35, Ely Place, Holborn, London. At Home for consultation daily from 11 till 1, and 5 till 8, Sunday excepted. Advice and Medicines, 1*l.*

PARR'S LIFE PILLS correct disorganisation of the stomach, and restore a healthy action of the liver, bowels, and kidneys, and remove all obstructions of the urinary passages, without the least griping or inconvenience. Persons who are suffering from headache or indigestion, whether arising from constitutional inaction, biliary disarrangement, or over-indulgence at the table, are particularly recommended to try PARR'S PILLS. They have never been known to fail in affording immediate relief. PARR'S LIFE PILLS will prove highly efficacious in bilious complaints, scorbutic complaints, affections of the nervous system, lowness of spirits, palpitation of the heart, rheumatic pains in the head, limbs, and other parts of the body, oppression of the chest, indigestion, redundancy of bile, dizziness of the eyes, violent pains in the temple and across the forehead, impaired memory, sick headache, tremulous action of the whole frame, restlessness and bad dreams, stupefic dozing, flatulency, costiveness, &c.—Sole proprietors and preparers, T. ROBERTS & Co., Crane Court, Fleet Street, London. Ask for PARR'S LIFE PILLS.—Sold by all Chemists and Medicine Vendors, in boxes price 1*s.* 1½*d.*, 2*s.* 9*d.*, or family packets, 11*s.* each. Directions with each box. Protected and guaranteed in all countries by the English Government Stamp fixed round the sides of each box.

WELLINGTONIA GIGANTEA.—Beautiful Lithographed Plates (from a drawing taken in California) of this wonderful Tree may be had, at 7s. 6d. each, of Messrs. VEITCH & SON, Exeter, and Mr. JAMES VEITCH, jun., Exotic Nursery, Chelsea.

The Bark, Wood, Cones and Foliage, which were exhibited on Tuesday last at 21, Regent Street, may be seen at the Exotic Nursery, Chelsea.—Feb. 25.

GERMAN DOUBLE DAISIES.—A fine healthy stock of the above unique Flower is now offered to the Public. It is very novel and distinct, and such as will give all purchasers satisfaction. Out of the 100 imported varieties, 50 of the most striking and best flowers have been selected, and can be sent out from one dozen plants, and upwards. These Daisies surpass everything for making edgings to flower beds, &c., and are quite a novelty of their kind; price 3s. 6d. per dozen, postage and package free; or 1l. 1s. per hundred, hamper and package free.

Also a fine stock of MYOSOTIS VANGLEEKI, or the new improved Forget-me-Not, well adapted for rock-work or making single beds; 2s. 6d. per dozen, postage free; 15s. per hundred, package free.

SWEET WILLIAMS.—A fine stock of very select and striking varieties 2s. per dozen, or 10s. per hundred, package free.

CHOICE HOLLYHOCK SEED saved from all the best and latest varieties yet sent out; 1s. 6d. per packet.

SEEDLING ANTIRRHINUM SEED, all from striped and spotted flowers, and will give every one satisfaction; 1s. per packet.

GERMAN ASTER SEED, saved from all first prize flowers; 1s. per packet.

STRAWBERRY PLANTS.—This is an excellent opportunity for those to plant who may have neglected to do so last autumn. Victoria, 5s. per 100; Prolific, 3s. 6d. per 100; Eleanor, 3s. 6d. per 100; Surprise, 3s. 6d. per 100; Cremont's Perpetual, 5s. per 100; and many other leading varieties, package free. The above named will be sufficient to give a supply of fruit the whole of the Strawberry season, being the earliest and latest varieties.

CUCUMBER and MELON SEEDS can be still supplied in varieties, and price, as advertised on the 18th inst. On receipt of a money order, or penny postage stamps, the whole, or any part of the above, will be immediately forwarded.

Just published,

NEW ILLUSTRATED CATALOGUE, WITH NEWSPAPER STAMP, POST FREE.

AGRICULTURAL SEEDS.

RENDLE'S NEW FARMING PRICE CURRENT, and AGRICULTURAL DIRECTORY for 1854, *Illustrated with several Engravings, is just published.*

It is the same size as the "Garden Directory," containing 52 pages crown quarto.

It contains a good Farm Almanac and List of Fairs and Great Markets held during the year in the Western Counties.

Descriptions are given of all the best varieties of SEEDS USED IN AGRICULTURE, and the prices of every article are fixed, so as to be a Price Current in the true sense of the word.

It contains a Descriptive Catalogue of all the best NATURAL AND ARTIFICIAL MANURES, with several useful remarks relating thereto.

It also contains an Original Article, written by J. B. LAWES, Esq., of ROTHAMSTED, HERTS; and another by J. C. NESBIT, Esq., F.G.S., the celebrated Agricultural Chemist.

Also the reprint of a Lecture on Guano, by PROFESSOR WAY, the Consulting Chemist to the Royal Agricultural Society.

The Directory is embellished with several illustrations of some of the best Agricultural Implements of the day, with letter-press descriptions of the same.

In a few words the proprietors have endeavoured to make it a useful companion to all engaged in Farming operations, and those who take an interest in the cultivation of the soil.

The "FARMING PRICE CURRENT AND AGRICULTURAL DIRECTORY," is now published, and can be ordered from any bookseller, price 6d.; through the London Publishing Office, 294, Strand; or from the Proprietors, WM. E. RENDLE & Co., Seed Merchants, Plymouth.

PEOPLE'S EDITION OF MR. MACAULAY'S ESSAYS.

JOHN SUTTON & SONS, *Seed Growers, Reading, Berks.*

CHOICE FRUITS AND VEGETABLES, ETC.

NOTICE TO GROWERS.—I wish to inform you that my present Prices for the undermentioned Goods are as herein stated; therefore should you have such to dispose of, you may forward them immediately.

PINES, from 2 lbs. to 3 lbs., 5s. 6d., 5s., and 4s. 6d. per lb.
CUCUMBERS, 2s. 6d., 2s., 1s. 6d., and 1s. each.
MUSHROOMS, 2s., 1s. 6d., and 1s. per lb.
FRENCH BEANS, 2s., 2s. 6d., and 3s. per 100.
CHOICE FLOWERS, according to quantity.

GEORGE TAYLOR, JUN., FRUIT-SALESMAN, St. John's Market, Liverpool.—Terms Cash on receipt of Goods.

A. NEILSON, Ayr Nursery, will be glad to supply Gentlemen, Nurserymen (with discount), or Florists, with One, Two, and Three times (3 to 4 feet fine) transplanted LARCHES, TREES, SHRUBS, &c., ROSES, HEPATICAS, double-blue and others, PRIMROSES, &c., at very low prices.

PINE PLANTS.

TO BE SOLD, 100 Fruiting and Succession Plants, mostly Queens, perfectly clean and healthy.—For particulars, apply to T. PERKINS, Nurseryman, Atherstone, Warwickshire.

SCOTCH FIR.

THE Subscribers can supply 2-year Seedling SCOTCH FIR, at a very low rate, if taken in quantity. Price given on application.—FOWLER & WRIGHT, Glasgow, March 4.

SILVER FIR FOR SALE.

JOSIAH HILL begs to inform Noblemen and Planters generally, that he has a large assortment from 1½ to 3 feet (twice transplanted), very healthy and good rooted.

Briston Nursery, Norfolk.

LIME TREES, 12 to 14 feet, 42s. per 100.—SPRUCE FIRS, 2 to 3 feet, 6s. per 100.—LAURUSTINUS, very fine, 30s. per 100.—Apply to BENJAMIN R. CANT, St. John's Street Nursery, Colchester.

TO RAILWAY CONTRACTORS, FARMERS, & OTHERS.

J. SELFE begs to announce that he has a stock of 100,000 very fine transplanted 5 years old WHITE-THORN QUICK, at 8s. per 1000. If more than 5000 are taken, 7s. 6d. per 1000. He has also a large collection of Spruce Fir, Laurel, Privet, &c., in fine condition, from 3 to 5 feet high. At moderate prices.—Surbiton Hill, Kingston, Surrey, March 4.

"WELLINGTONIA GIGANTEA."

MESSRS. VEITCH, of EXETER and CHELSEA, have much pleasure in stating that their Seeds of the above magnificent Tree are vegetating satisfactorily. They therefore hope to be able to send out well established seedling plants during the ensuing summer and autumn. They are now taking orders for them at the following prices:—

For a Single Plant ... 2 guineas | For 8 Plants ... 10 guineas
For 4 Plants ... ... 6 guineas | For 12 Plants ... 12 guineas

And all orders will be executed strictly in the rotation in which they are received.—March 4.

WELLINGTONIA GIGANTEA.—Beautiful Lithographed Plates (from a drawing taken in California) of this wonderful Tree may be had, at 7s. 6d. each, of Messrs. VEITCH & SON, Exeter, and Mr. JAMES VEITCH, jun., Exotic Nursery, Chelsea.

The Bark, Wood, Cones and Foliage, which were exhibited on Tuesday week at 21, Regent Street, may be seen at the Exotic Nursery, Chelsea.—March 4.

NEW CUCUMBER.

MARSHALL'S "IMPROVED JEWESS," a hybrid between the Brewston and Mills's Jewess. It is a good bearer, dark green, black spine, a first-rate variety for early forcing and general crop. Seeds may be obtained of Mr. MARSHALL, Gardener to John Sick, Esq., Chiswick, Middlesex. A packet of five seeds, 2s. 6d.

IPOMŒA RUBRA CÆRULEA.

MR. GEORGE ROBERTS begs to make known to the Seed Trade that he can supply the above-named scarce Seed.—For prices apply to him at 32, Moorgate Street, London, where dried Specimens of the Flowers and Leaves may be seen. Purchasers of a small number of Seeds will please obtain them from the principal London Seedsmen.

JOHN JEYES, NURSERYMAN, Northampton, has to offer fine dwarf-trained trees of the following fruits:—

MORELLO, and other Cherries; MOOR PARK APRICOTS; GREENGAGE, and other Plums.

DOUBLE FRENCH MARIGOLD AND CAPE STOCK SEEDS. A packet of beautiful DOUBLE FRENCH MARIGOLD SEEDS forwarded on receipt of Seven Penny Postage Stamps. Ditto, SCARLET CAPE STOCK, ditto. EDWARD SANG & SONS, Nursery and Seedsmen, Kirkaldy, N.B.

JOHN COLE begs to inform the lovers of CALCEOLARIAS that he has a few choice Seedlings to dispose of, having succeeded in raising more than he has convenience to grow, and offers them, strong plants, at 4s. per dozen, or 25s. per 100. J. C. begs to state the seed was saved from choice impregnated spotted and striped varieties. A remittance solicited from unknown correspondents.

Keyfield Nursery, St. Alban's, Herts.

CORNWELL'S VICTORIA RASPBERRY; unequalled for size, flavour, and brightness of colour—containing more juice than any other, and an abundant bearer. The certificate of merit has been awarded to them at all the principal metropolitan shows; the fruit also sells for more than any other at Covent Garden Market. Canes of the above to be had of GEORGE CORNWELL, Market Gardener, Barnet, at 15s. per 100. Also White and Rivers's Autumn Trailed, 15s. per 100; strong Red, Black, and White Currants, 2s. to 3s. per doz.; Double Lilac Primroses, large Laurustinus. The usual allowance to the trade.

GEORGE CLARKE begs to invite purchasers to inspect his splendid Collection of ROSES, extending over 10 acres of ground. Fine Standards of the leading kinds, 18s. per doz.; Dwarf ditto, 12s. per doz. Catalogues can be had.

Evergreens, Coniferæ, fine trained Peaches, Nectarines, Apricots, &c., at very moderate charges. Strong Dielytra spectabilis, 5l. to 10l. per 100. Also 100 fine Specimen Erica depressa, which will be sold at a bargain.

Streatham Place Nursery, Brixton Hill, near London.

THE ROYAL MOSS-POD PEA.—The attention of horticulturists and of the public in general is called to this new and peculiar PEA, as being surpassed by none in exquisite flavour and colour on table; it is at the same time highly productive. To be had only of Mr. DENNIS, West Court, Detling, Maidstone, at 2s. 6d. per quart, and will be forwarded in any quantity (not less than a quart), to all parts of the kingdom, on receipt of postage stamps or post-office order for the amount.

FIRST CLASS PRIZE VERBENAS.—The set of six, advertised by J. KEYNES in his Catalogue will be ready to send out the 21st of March, in fine well-established Plants, by post, free, for 20s.

These are six of the most beautiful Verbenas ever offered, and were much admired in the Surrey Gardens, the only place they were exhibited, and obtained First Class Certificates. Only a few sets left unordered.

JOHN KEYNES, Nurseryman, Salisbury, March 4.

CONQUEROR OF THE WEST CUCUMBER.

JAMES LAKE, NURSERYMAN, &c., Bridgewater, begs once more to offer the above Cucumber. Having tested its merits against many other sorts highly spoken of, can with confidence recommend it as the best for general frame culture. Packets containing 12 good Seeds sent post free on the receipt of 12 postage stamps.

N.B. The Trade supplied with the genuine article.

J. L. also begs to state that he will be prepared to send out the first week in May, strong Plants of his beautiful Seedling LOBELIA ST. CLAIR, so universally admired last summer and autumn, at 12s. per dozen. The usual discount to the Trade.

EARLY SEED POTATOES.

EARLY ASH-LEAF KIDNEYS, 10s. per bushel.
EARLY SHAWS, 7s. per bushel.

The Advertiser, in calling the attention of Growers to the above, would state that they have been carefully selected for Seed purposes, and they are entirely free from disease; for quality and yield they cannot be excelled. Bags not charged extra. A sample bushel will be sent to any part of the country on receipt of a Post-office order, made payable to JOSEPH WILSON, St. Helen's Street, Ipswich, Suffolk.

MESSRS. YOUELL AND CO.

BEG TO OFFER THE FOLLOWING:—

ERICA VENTRICOSA SUPERBA, finely set with flower-buds. We particularly recommend these to the trade at 60s. and 75s. per 100.

ERICAS.—Fine bushy blooming plants, in large 48s, of the following sorts, at 12s. per dozen varieties, viz.:—*Aggregata, Bowei, *Coventryana, *Cavendishi, colorans, *densa, *daphnoidea, echiflora, *exsurgens coccinea, *gracilis, *hyacinthoides, intermedia, *Linnæoides nova, lævis alba, mirabilis mammosa, metulæflora bicolor, *nigrita, *ovata, pyriformis, perspicua nana, *rubens, rubra calyx, trossula, transparens nova, Westcoti, *Wilmorea superba, Walkeri, viridiflora, *ventricosa breviflora, *v. Bothwelli, *v. coruscans, v. carnea, v. dependens coccinea, *v. fasciculata rosea, *v. f. longiflora, *v. f. superba, *v. hirsuta, *v. perspicuoides, *v. superba, *v. tenuiflora, *v. tumida.

ERICAS, in small and large 60s, nice bushy plants, many of them set for flower. All the above named marked with an asterisk, as well as the following, at 9s. per dozen varieties, viz.:—Denticulata moschata, elata, hyemalis, hybrida, scabriuscula, Sindryana, trossula rubra, umbellata, verticillata, ventricosa, cintra rubra, v. densa carnea.

EPACRIS HYACINTHIFLORA, by far the best of the campanulata varieties, in strong plants, 1s. 6d. each.

„ hyacinthiflora candidissima (Storey's).—Is a magnificent white variety, individual flowers very large, 1s. 6d. each; small, in stores, 9s. per dozen.

EPACRIS.—The following choice varieties, in 48s, well set for bloom, at 12s. per doz. varieties, viz.:—Ardentissima, Atleeana, campanulata alba, c. grandiflora, c. maxima, Copelandica, carnea, coruscans, densiflora incarnata, elegantissima, formosa, grandiflora, impressa, imp. alba, imp. magna, lineatus magnifica, miniata, nivalis, onosmæflora, pulchella major, purpurescens, sanguinea, Tauntoniensis, the Bride, variabilis.

Epacris, flowering plants, our own selection, to the trade, 60s. p. 100.

Abelia uniflora, small, 12s. per dozen.

Abutilon insigne, Linden's fine new species, 2s. 6d. each.

Aphelexis humilis and superbum, strong bushy plants, in large 48s, well set for flower, 12s. per dozen.

Burchellia capensis nana. This fine old favourite, 12s. per dozen.

CAMELLIAS.—The well known difficulty of inducing the greater part of the choice varieties to bloom in a young state, tempts us to offer the following, in stout plants, without buds, at 21s. per dozen, viz.:—Beali, Monarch, Juliana, Bruceana, Forbesi, Grand Frederic, Ruckeri, Lombardi, Horsfalli, Lefeveriana, Picturata, Lepidata, Fimbriata rubra, Agnesi, Sieboldi, &c.

Cassia corymbosa, a good winter-flowering plant, in 48s, 9s. p. doz.

Leanothus rigidus and dentatus, in large 60s, 12s. per dozen.

Thorozema Lawrencianum, strong flowering plants of this charming variety, in large 48s, 1s. 6d. each.

CALCEOLARIAS—Crimson King (Henderson), deep crimson, very dark and rich, and does not fade; habit dwarf and robust, flowers large, and shape good.

„ Magnificent (Henderson), rich crimson, with yellow crown; a large, fine-formed, and very splendid flower, quite distinct from anything yet out.

„ Gold Chain, fine golden yellow, of great substance and fine habit, with very stout foot-stalks.

„ Gold Cap (Garraway), rich dark maroon, the upper division of the flower deep gold colour, the flowers large and of fine compact habit.

These handsome varieties will be found the gems of the season, or bedding; strong plants, 2s. 6d. each, or 21s. per dozen.

CINERARIAS, the choicest of the new varieties; strong flowering plants, in 48s, 12s. per dozen.

Correæ speciosa, major, bicolor, and Cooperi; strong flowering plants, 12s. per dozen.

Daphne collina, 12s. per dozen; Dauphine, 18s. per dozen.

Deutzia gracilis, small, 9s. per dozen.

Diosma ericoides and capitata, nice bushy plants of these sweetly-scented species, 9s. per dozen.

Eutaxia myrtifolia, strong bushy plants of this fine old favourite, in large 48s, 9s. per dozen; floribunda, in 60s, 9s. per dozen.

FUCHSIAS: choicest of the new kinds, including Glory (Banks), England's Glory, King Charming, Dr. Lindley, Duchess of Lancaster, Incomparable, &c., 21s. per dozen.

Fairy Roses, 9s. per dozen.

Kennedya Marryattæ, 1s. 6d.; monophylla, 1s.; alba, 2s. 6d.; and rubicunda maxima, 1s. 6d.

Mandevilla suaveolens, certainly the finest greenhouse or conservatory climber we possess, 9s. to 12s. per dozen.

Mimulus variegata. This very beautiful variety produces large white flowers, handsomely spotted with rich crimson, 1s. each.

Mimulus, 6 handsomest varieties, including the foregoing, for 4s. 6d. the set.

Mitraria coccinea, strong flowering plants, 2 feet, 3s. 6d. each; smaller, 1s. 6d.

Olea fragrans, 24s. per dozen.

Passiflora racemosa cærulea, in large 48s, 12s. p. doz.; Bellotti, fine new peach-coloured variety, 1s. 6d. each; Buonaparti, 1s. 6d. each.

Philadelphus mexicanus, an elegant shrub with large white flowers, more fragrant than the Orange, 2s. 6d. each.

Pimelea decussata, 9s. per dozen.

Pittosporum tobirum, this fine old favourite, 1s. 6d. each.

Sollya Drummondi, strong, 1s. 6d. each; heterophylla, 12s. per dozen; linearis, 12s. per dozen.

Swainsonia Osbornianæ, new, 12s. per dozen.

Tecoma australis, 1s. 6d. each; jasminoides, 12s. per dozen; rosea, 1s. 6d. each.

Tetratheca ericæfolia, small, 18s. per dozen.

Tree Carnations, of choicest kinds, 18s. per dozen.

Geranium Flower of the Day, 6s. and 9s. per dozen.

„ Crimson Ivy-leaf; this fine variety, sent out by Messrs. Standish & Noble, 5s. each (splendid for bedding).

HARDY SHRUBS.

Berberis Darwini, 12s. p. doz.; very strong and bushy, 3s. 6d. each.

„ Fortuni, 12s. per dozen; dulcis, strong, 4s. per dozen.

Bays (sweet), fine plants, 2 to 2½ feet, 6s. per doz.; 35s. per 100.

Cerasus illicifolia, a new hardy evergreen Cherry from California, producing purple fruit, 3s. 6d. each.

Chimonanthus fragrans, strong, 12s. per dozen.

Clematis azurea grandiflora, strong, 12s. to 15s. per dozen; Sieboldi, strong, 12s. to 15s. per dozen; Montana, strong, 12s. per dozen; flammula, or sweet scented, in pots, 9s.

Escallonia macrantha; strong plants of this most charming evergreen flowering shrub, 12s. per dozen.

Euonymus fimbriatus, strong plants of this handsome evergreen, 2s. 6d. each; japonicus fol. variegatus, 9s. per dozen.

Ilex Castanifolia, strong, 3s. 6d. each; Cunninghami, 3s. 6d. each; latifolia, strong, 1s. 6d. to 3s. 6d. each; Sheppardi, fine, strong, 1s. 6d. each.

Jasminum revolutum, strong, 12s. per dozen.

Lardizabala biternata, a fine hardy evergreen creeper, 5s. each.

Ligustrum ovalifolium, new species, 12s. per dozen.

Passiflora cærulea, strong, 9s. to 12s. per dozen.

Quercus Fordi, 2 to 3 feet, 21s. per dozen; Ilex Hume, 2 to 3 feet, 30s. per dozen; ballota, 2s. 6d. each; rotundifolia, 2s. 6d. each.

ROSES.—"Queen Victoria" (Paul's), standard and half standard, 2s. 6d. each; "Prince Albert," strong, in pots, 5s. each; standards and half standards, of best kinds, 15s. to 18s. per dozen; dwarfs on own roots, 6s. and 9s. per dozen.

Wistaria sinensis, strong, 12s. to 24s. per dozen.

Weigela rosea, strong bushes, 2 to 3 feet, 9s. per dozen.

Yucca gloriosa superba, strong, 3s. 6d. to 5s. each.

CHOICE HOLLYHOCKS, PANSIES, AND OTHER HERBACEOUS PLANTS, BULBS, ETC.

HOLLYHOCKS.—The following fine varieties, in strong plants, well established in pots, 12s. per dozen varieties:—Bicolor, Commander-in-Chief, Conspicua, Delicata, Eclipse, Fireball, Formosa Improved, Lilac Perfection, Magniflora, Magnum Bonum, Maiden's Blush, Mr. Charles Baron, Mulberry Superb, Obscura, Princess Alice, Princess Helena, Princess Royal, Queen, Rosea Alba, Rosea Rubra, Snowflake, Venosa Rubra, Walden Gem, Rosy Queen, &c.

PANSIES.—The following choice kinds, at 10s. per dozen varieties:—Alba Superba, Androcles, Blanche, Cæsar, Calysto, Caroline, Commander-in-Chief, Crystal Palace, Drusilla, Duchess of Rutland, Elegant, Emma, Euphemia, Glory, Helen, Heroine, Indian Chief, Isabella, Junius, Lady Carrington, Lady Franklin, Lady Harding, Lord Jeffery, Marchioness of Lothian, Masterpice, Miriam, Miss Talbot, Mrs. Beck, Penelope, Polyphema, Post Captain, Prince Arthur, Princess, Queen of England, Rubens, Sambo, Smolensko, The Rajah, Uttoxeter Hero, Viceroy, Yellow Prince.

CHRYSANTHEMUMS, comprising the very best of the new kinds of large flowering and Pompon varieties, in strong plants, 6s. to 9s. per dozen.

Delphinium Mooreanum.—This beautiful new variety is unequalled for the richness of its "blue," and its general good habit, and must be grown in every flower garden, 18s. p. dozen.

Delphinium Barlowi, fine, 9s. per dozen.

Daisies, new Belgian, in 50 fine varieties, 4s. per dozen.

Dielytra spectabilis, 9s. per dozen.

Funkia grandiflora, 2s. 6d. each.

Rockets, double white, 3s. per dozen; purple, 4s. per dozen; crimson, 1s. 6d. each.

Oxalis rosea, one of our prettiest hardy herbaceous plants, and nearly always in flower, 6s. per dozen; floribunda, 6s. per dozen.

Pæonies, herbaceous, in 25 fine varieties, 12s. per dozen.

Phloxes, in numerous fine varieties, 9s. to 12s. per dozen.

Potentilla M'Nabiana, and other choice kinds, 6s. per dozen.

Primrose, double white, 4s. per dozen; double yellow, 4s. per dozen; double purple, 4s. per dozen; double lilac, 3s. per dozen; double crimson, 12s. per dozen.

Silene maritima plena, fine double white, 9s. per dozen.

Statice latifolia, strong, 9s. per dozen; pseudo armeria, 6s. per dozen; maritima rosea, very pretty and distinct, 6s. per dozen.

Choice selection of Herbaceous Plants, 25s. per 100.

Tigridia conchiflora, the yellow spotted tiger flower, a very desirable summer and autumn blooming bulb—it makes beautiful beds, 3s. per dozen.

Gladiolus insignis, one of the handsomest of the genus; the flowers, which are produced freely, are of a glowing scarlet, suffused with purple, 4s. per dozen; Brenchleyensis, a magnificent new variety, 3s. 6d. each.

Lilium colchicum, a magnificent new species, with lemon-coloured flowers, 7s. 6d. each; lancifolium album, flowering bulbs, 9s. per dozen; l. rubrum, flowering bulbs, 18s. per dozen.

Lily of the Valley, strong roots, 5s. per 100.

CARNATIONS AND PICOTEES.—Beautiful selections from their superb and extensive collections, at 18s., 24s., and 30s. per dozen pairs; fine mixed, for borders, 9s. per dozen pairs. True Old Clove Carnation, 12s. per dozen pairs.

PINKS.—Four fine sorts by name, 9s. to 12s. per dozen pairs.

CHOICE FRUITS. (WARRANTED TRUE TO NAME.)

"FASTOLFF RASPBERRY."—It is with much satisfaction that we announce a third award made by the London Horticultural Society, on 26th of July last, for examples of the above most excellent Raspberry, unequalled by any other variety for the size of its fruit and richness of flavour.

It is reported in the *Gardeners' Chronicle* of July 30th, page 486, as follows:—"Messrs. Youell, of Great Yarmouth, sent a boxful of beautiful fruit of the Fastolff Raspberry; they were unusually fine, and well deserved the certificate of merit awarded them."

Strong well-rooted canes, 15s. per 100; Large White Raspberry, 24s. per 100; New Monthly Fruiting, 24s. per 100.

APPLES, standard, in best selection, good heads 9s. per dozen.
„ dwarf „ „ 6s. „
„ trained „ „ 30s. „
PEARS, standard „ „ 12s. „
„ dwarf „ „ 8s. „
„ trained „ „ 30s. „
PLUMS, dwarf „ „ 9s. „
„ trained „ „ 36s. „
PEACHES, dwarf trained, in fine strong plants, 36s. to 60s. „
NECTARINES, dwarf trained, „ 36s. to 60s. „
APRICOTS „ „ 36s. to 60s. „
CHERRIES, standard, in fine variety ... ... 12s. „
„ dwarf „ ... 9s. „
„ trained „ 36s. to 42s. „

GOOSEBERRIES, 25 of the finest varieties (good bushes) selected for size and flavour, 30s. per 100; 4s. per dozen.

CURRANTS, improved large white Dutch, Black Naples, Raby Castle (red), and Large Red Grape, 4s. per dozen; Knight's Sweet Red, 6s. per dozen; these are the most desirable kinds in cultivation, and are highly recommended.

RHUBARB, Myatt's Victoria, 9s. per dozen; Royal Albert, 9s. per do.; Linnæus, 9s. per do.; Tobolsk, 6s. per do. (strong).

SEAKALE, strong, 2 years, 6s. per 100.

ASPARAGUS, extra strong, 3 years old, 3s. 6d.; 2 years old, 2s. 6d. per 100.

EVERGREEN PRIVET, fine Bushy cut back Plants,
2½ to 3 feet, 5s. per 100, or 35s. per 1000.

☞ Less quantities than those named above supplied at the same prices. Orders of 2l. and upwards are delivered Carriage Free to London or Hull, or to any Railway Station within 150 miles of the Nursery.

YOUELL & Co. beg to refer to their Advertisement which appeared in this Paper of Feb. 4. Catalogues will be forwarded free on application. ANEMONE SEED, saved from selected roots, 10s. per lb. The usual discount to the trade.

YOUELL & CO., Royal Nursery, Great Yarmouth.

NEW AMERICAN WHITE-FLOWERED FLAX.

FREDK. AD. HAAGE, JUN., NURSERYMAN and SEEDSMAN, Erfurt, Prussia, offers Seed of the above at 3s. per lb. This species was discovered by Sir Robert Schomburgk, at the source of the Orinoco. It supersedes the common cultivated Flax in size of growth, fineness and whiteness of fibre, which is extremely strong and silk-like. Its great importance cannot too strongly be recommended. Specimens of the plant fibres may be had on application. Orders will be received by Mr. JAMES CARTER, Seedsman, High Holborn, London.

Erfurt, March 4.

ZINNIA ELEGANS.—Collection of 6 beautiful varieties	2	6

We can strongly recommend the above as being of first-rate quality. They will be forwarded postage free.

J. C. WHEELER AND SON, GLOUCESTER.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, AND LANDSCAPE GARDENERS, Bagshot, Surrey, have now on sale the undermentioned rare and beautiful Hardy Shrubs, which are entirely new to English gardens, having been recently introduced by them from the north of China.

BERBERIS JAPONICA is undoubtedly the finest evergreen shrub in cultivation. Its leaves are from 15 to 18 inches long, having a terminal leaflet 3 inches long by 3 or 4 broad, and the lateral ones, of which there are many pairs, are nearly as large. They are of a very thick leathery texture, and are armed with strong spiny teeth. The flowers, which are of a lemon-yellow colour, are produced in terminal racemes; and they are delightfully fragrant, with the odour of a Tea Rose. Dr. LINDLEY says of it, in the "Flower Garden," that "it will be the noblest evergreen bush in Europe." Each 5l. 5s.

BERBERIS BEALII.—A worthy rival of the preceding, from which, however, it differs much in general appearance. Its leaflets are narrower, more pointed, and have fewer spines; and they are more distant on the leaf-stalk; a greater number of pairs are also comprised in each individual leaf. On the whole, we believe these two plants to be the finest hardy evergreen shrubs that have been introduced for many years. Each 5l. 5s.

EMBOTHERIUM LANCEOLATUM; a large evergreen flowering shrub, growing 12 or 15 feet high, with the habit of a Portugal Laurel, but having lanceolate leaves a foot long; the flowers are of the richest scarlet, in spikes 12 to 18 ins. long, which are raised well above the foliage. The appearance of a plant in flower is in the highest degree attractive. For a conservatory it cannot be surpassed. If it should prove hardy (and the advertisers hope that it will), it will be impossible to overrate its value as a flowering shrub. Each 21s. to 42s.

The advertisers also beg to offer the following rare and desirable plants; the whole of which they have themselves introduced, and of which they consequently hold the entire stock:

AZALEA AMŒNA.—A Chinese species, perfectly distinct from any other known Azalea; each flower appears like two corollas, one within the other, like a hose-in-hose Polyanthus. They are bright rosy purple, and are produced in great profusion. For forcing, for decorating the conservatory, or for cutting for bouquets, no plant can excel it; and it is perfectly hardy, as hardy as Rhododendron dauricum. 3s. 6d. to 21s.

AZALEA NARCISSIFLORA, a variety having double white flowers, like those of the plant whence it takes its name. It is very handsome, blossoms freely, and will be found a great novelty. Each 10s. 6d.

AZALEA VITTATA. Each 2s. 6d.
„ „ PUNCTATA. Each 2s. 6d.
„ „ ROSEA. Each 3s. 6d.

The last three named very handsome striped varieties are now well known, and we need not enter upon a description here. But we are now enabled to state that they are perfectly hardy, which quality will render them very useful in the open borders, as no plants can produce their flowers in greater abundance.

CALCEOLARIA HYSSOPIFOLIA, a very interesting plant, from the Andes of South America, with bright golden yellow and white flowers. Habit neat, with good foliage. It is an excellent bedding plant, being a most profuse bloomer; and, the lip of the corolla being entirely closed, the flowers are not liable to be damaged by rain. 10s. 6d.

PODOCARPUS CHILINA.—This fine plant is one of the few long-leaved species of Podocarpus that has proved quite hardy. The leaves of this are from 4 to 5 inches long, and in every respect it is a fine Conifer. 21s. each.

PODOCARPUS NUBIGENA, a new species from Patagonia, forming an upright compact growing tree of great beauty; quite hardy and distinct. 31s. 6d. to 63s. each.

SKIMMIA JAPONICA, a fine, hardy, compact-growing shrub, from the north of China. The leaves are thick and fleshy, of a deep green, smooth on both sides, 5 or 6 inches long by 1½ inch broad, of an oblong shape. In May it is covered with dense heads of greenish-yellow flowers, which emit a very strong and agreeable odour, resembling that of Daphne indica. These are followed by bunches of bright scarlet oval berries, which remain upon the plant all the following winter. It produces both flowers and fruit when but 5 or 6 inches high. As an ornamental shrub for the lawn, or for the winter decoration of the conservatory, it has scarcely a rival. No degree of cold seems to injure it." The foregoing, which we extract from our "Practical Hints," is what we expressed of this plant when first offering it for sale; and subsequent experience confirms all that is there stated. Our plants in the open borders received no injury during the late severe winter. The berries that were ripened last year are still upon them, and will no doubt remain till they are in bloom again in spring. Each 10s. 6d. to 15s.

SAXE-GOTHÆA GRACILIS.—A very interesting plant. In habit it is peculiarly graceful and distinct, and it grows very much more rapid than *S. conspicua*. Each 21s. to 36s. 6d.

VIBURNUM MACROCEPHALUM.—A fine, hardy, evergreen shrub, bearing globular heads of Hydrangea-like flowers, 10 inches in diameter, of the purest white. It is a very free bloomer, and forms a noble shrubbery plant. Each 10s. 6d. to 21s.

VIBURNUM PLICATUM.—A deciduous species, wholly distinct from the preceding; a very fine shrub, with handsome foliage covered in spring with snowy white flowers, and is perfectly hardy. Each 5s. to 7s. 6d.

*** Catalogues may be had by enclosing a stamp for postage.

GRASS SEEDS, SEPARATE OR MIXED, CARRIAGE FREE.

SUTTON AND SONS *having for many years paid especial attention to the laying down Land to Permanent Pasture, are well acquainted with the various soils of most parts of the United Kingdom, and the Natural Grasses suitable for each locality.*

The following sorts may be had separate or mixed, at lowest market prices. All the best and most suitable of them are contained in our Mixtures for the several purposes described below.

Alopecurus pratensis	Festuca tenuifolia	Poa trivialis
Anthoxanthum odoratum	Festuca hordeformis	Poa nemoralis
Agrostis stolonifera	Glyceria fluitans	Poa angustifolius
Avena flavescens	Glyceria aquatica	Poa fertilis
Achillea millefolium	Holcus lanatus	Poa sempervirens
Cynosurus cristatus	Holcus avenaceus	Phleum pratense major [minor
Dactylis glomerata	Lolium Italicum	Phleum pratense
Festuca duriuscula	Lolium perenne tenue	Petroselinum sativum
Festuca elatior	Lolium perenne Paceyanum	Trifolium repens
Festuca gigantea	Lolium perenne sempervirens [major	Trifolium pratense perenne
Festuca heterophylla	Lotus corniculatus	Trifolium minus
Festuca pratensis	Medicago Lupulina	Trifolium hybridum
Festuca ovina	Poa pratensis	
Festuca rubra		

SUTTON'S MIXTURES FOR LAYING DOWN LAND TO PERMANENT MEADOW OR PASTURE.

Mixed expressly to suit the soil, according to whether it is heavy, light, or medium. The sorts contained in these Mixtures are grown in different localities, and gathered separately by the hand, expressly for this purpose, by which means all noxious weeds are excluded. They consist of the most nutritive kinds of Fescues, Poas, Sweet Vernal, Perennial Clovers, Lolium, &c., and each sort being kept separate, they are subsequently mixed in such sorts and proportions as are most suitable to the soil to be laid down. *These Seeds can now be supplied for* **24s. to 30s.** *per acre, according to the sorts which the soil may require.* The quantity we usually supply is 2 bushels of light Seeds and 12 lbs. heavy Seeds per acre; *but if coarser Grasses, which have larger Seeds, 3 bushels or more would be necessary.*

MIXTURE FOR RECLAIMED PASTURES AND HEATH LANDS.

Many acres of land of this description have been successfully laid down to Permanent Pasture by us, with Seeds which we have found invariably to thrive on such soil. The cost for this purpose is **16s. to 21s.** per acre, according to circumstances.

MIXTURES FOR LAYING DOWN CHALKY OR GRAVELLY UPLANDS AND SHEEP DOWNS.

For this purpose Grass Seeds are annually collected from dry and hilly districts, where they are found growing spontaneously; and, after many years' experience, we can confidently assure our friends that a good and permanent sward may be obtained on any upland from this mixture. Price **30s.** per acre.

SUTTON'S MIXTURES FOR LAYING DOWN WATER MEADOWS.

In this department also we have been very successful, many customers having expressed their great gratification at the effect of these Seeds. Cost of Seeds for this purpose, **24s.** per acre.

MIXTURES TO LAY DOWN NEW PARK LAWNS, **18s.** per bushel.

RENOVATING MIXTURES FOR IMPROVING OLD PASTURES, **1s.** per lb.

There are now but few Counties in England wherein Pastures may not be seen which have been formed with our Mixtures of Grass Seeds; it may therefore appear superfluous that we should publish anything in the way of testimonials. We will, however, quote the following from among many other letters recently received, now before us:—

From Sir Willoughby Jones, Bart., Cranmer Hall, Fakenham, Norfolk.—January 31, 1854.

The Grass Seeds you supplied me with last year have produced an admirable set, far better than any seeds I have procured elsewhere.

From Mr. Dowdeswell, Steward to R. B. Sheridan, Esq., Frampton Court.—October 23, 1853.

The Grass Seeds have turned out uncommonly well this season, and we have some very fine crops of Turnips, Swedes, and Mangold Wurzel.

From the Rev. Joshua Bennett, Cowersham Parsonage.—Feb. 1, 1853.

Messrs. SUTTON & SON'S Permanent Grass Seeds, in less than three months, has presented a most luxuriant herbage, forming a striking contrast to the self-sown turf around it.

From N. Manby Power, Esq., the Hill Court, Ross, Herefordshire.—April 2, 1853.

The Grass Seed sent has answered very well, and is almost a sward already.

From Rev. J. W. Knife, Woodford Rectory, Dorset.—Feb. 16, 1853.

The Grass Seed I had in the spring has given very great satisfaction.

From Rev. Robert Hawthorn, Stapleford Lodge, near Cambridge.—October 31, 1853.

I was very much pleased with the Grass Seeds which you sent me; the Grass sprang up quickly and covered the field well.

In several of the above instances the land laid down was heavy clay, and others so poor and gravelly as to be quite unprofitable as arable land. Our present prices are from **24s. to 30s.** *per acre, as see above.*

We have also a superior Stock of Turnip Seeds, Mangold Wurzel, Carrot, and other Agricultural Seeds, Catalogues of which will be forwarded on receipt of one penny stamp.

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

Goods Delivered Carriage Free.

EDWARD GEORGE HENDERSON AND SON, Wellington Nursery, St. John's Wood, begs to recommend the following:—

GLOXINIA DUKE OF WELLINGTON.—A rich velvety scarlet, of stout substance, the throat shaded with violet, and slightly spotted with white; flowers very large and conspicuous. Price 7*s.* 6*d.*

GLOXINIA LADY FRANKLIN is a plant of stout robust habit; flower extra large; rose, shading to pink, slightly spotted with white in the throat. Price 7*s.* 6*d.*

GLOXINIA LEONIE VAN HOUTTE.—Can be highly recommended as the most distinct variety that has been introduced for the last two years; the colour is of a delicate pink or peach, with a white centre, the white extending all round the throat from the base of the flower to the margin of the tube. Price 5*s.* and 7*s.* 6*d.* each.

ACHIMENES CHERITA.—A new species from Mexico, distinct, of a dwarf, spreading, free habit of growth, good foliage, and a Campanula-shaped flower of a light blue. It is a plant possessing great merits, very attractive, and should be introduced into every collection. Price 5*s.* and 10*s.* 6*d.* each.

ACHIMENES SIR TRECHERNE THOMAS.—A large rich coloured flower, fimbriated (some will say it is a carmine, others a crimson or rosy purple; we do not, however, know ourselves what colour to call it, but it is the best Achimenes we possess); habit excellent, robust, and dwarf, a free abundant flowerer, and one that will supersede a dozen other varieties that have hitherto been cultivated.

N.B. Any or all of the above forwarded post free, and the usual discount to the trade.—March 4.

MAY'S PARAGON CABBAGE, AND MAY'S MAGNUM BONUM LETTUCE.

THE Subscriber, in offering the above for the first time, guarantees it to be the finest Cabbage in existence; of dwarf habit; has never been known to run; attains a large size (having been grown to the great weight of 28lbs); of a most beautiful green, and boils tender as Asparagus, which it continues to do throughout the season; in flavour is as far superior to the ordinary Cabbages of the day as they are to the old Drumhead Scotch. In ¼ oz. packets, 1*s.* each, free by post. The usual allowance to the trade.

MAGNUM BONUM LETTUCE.—This incomparable summer Lettuce is also offered for the first time for sale, and in consequence of the impossibility of seeding it in the open air, the whole having been grown in pots under glass, the stock is exceedingly limited. In form it resembles the Maltese, only a little more upright; as crisp as the Paris Cos, never runs to seed, and has been grown to the amaziug size of 4 feet in circumference. In packets, 1*s.* each, free by post.

Vegetable and Flower Seeds of the best quality. See Advertisement in the *Gardeners' Chronicle* of January 28.

Address all orders and communications to HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

BASS AND BROWN'S SEED AND PLANT LIST free by post for three penny stamps.

COLLECTIONS OF VEGETABLE SEEDS.

The following comprise the best in cultivation, including several new sorts of first-rate quality:—

No. 1, Collection for a large garden, for one year's supply	£3	0	0
No. 2, Collection in smaller proportions	2	0	0
No. 3, Collection, ditto	1	5	0
No. 4, Collection of choice kinds for a small garden ...	0	15	0

If any sorts of Vegetables are not wished for, enlarged quantities of others will be sent to make up the amount.

The list of quantities of each sort supplied in the No. 1, 2, and 3 Collections are contained in the General Spring Catalogue.

For a few choice new Vegetables, see *Gardeners' Chronicle* of Feb. 13th and 27th, advertised.

FLOWER SEEDS—BEST ASSORTMENTS, free by post.

The Catalogue gives colours, heights, months of flowering, hardiness, duration, and much descriptive information of time of sowing, and other treatment.

	s.	*d.*
100 varieties select showy Annuals, which will include the beautiful new Leptosiphon luteum, Calceolaria chelidonioides, Nemesia bicolor, fine new varieties, splendid Prize Asters, Stocks, Zinnia, &c. &c.	15	0
50 varieties, including new, 8*s.* 6*d.*; 30 varieties ditto, 5*s.* 6*d.*; 20 varieties ditto	4	0
20 varieties best Dwarf Annuals, in large packets, for filling beds on lawns, 7*s.* 6*d.*; 12 do.	5	0
20 vars. choice Greenhouse Annuals, including the new Gomphrena aurantiaca, Salpiglossis atrosanguinea, new Portulaccas, Rhodanthe, Thunbergia, Phlox Drummondi, &c., 7*s.* 6*d.*; 12 varieties, including new...	5	0
20 vars. choice Greenhouse Perennials, including very fine and new Calceolaria, Cineraria, Fuchsia, Petunia, Verbena, Chorozema, Calendrinia umbellata, &c. ...	10	6
12 varieties ditto ditto	7	6
20 vars. Hardy Biennials and Perennials, including very choice Antirrhinum, Gladioli, Heartsease, Mimulus, Dianthus, Brompton and Emperor Stock, &c., 7*s.* 6*d.*; 12 varieties ditto	5	0

The following we beg strongly to recommend as saved from collections of first-class flowers, in packets as follows:— *s.* *d.*

Calceolaria, very choice, 1*s.*; extra superb, from fine selected flowers	2	6
Cineraria, very choice, 1*s.*; extra new and choice from our superb collection	2	6
Fuchsia, new and choice, from our superb collection ...	1	0
Geranium, extra choice and new, from our superb collection	2	6
„ Scarlet, from our choice collection	0	6
„ Fancies, from our beautiful collection of best varieties	1	6
Gloxinia, choice, 6*d.*; extra, from our superb collection ...	2	6
Petunia, new and choice, from our superb collection ...	1	0
Verbena, very choice, 1*s.*; extra, from our superb collection of new varieties	2	6
Antirrhinum, choice, 6*d.*; from new of our superb collection	1	0
Carnation and Picotee, from collection of 400 vars	2	6
Gladiolus, fine mixed early, 6*d.*; from choice named of our superb collection	1	0
Iris, English vars, fine, 6*d.*; best of our superb collection...	2	6
Pansy, extra choice, from a first-rate collection	1	0
Potentilla, very choice, 1*s.*; extra, from our very beautiful collection	2	6
Ranunculus, from our superior collection	2	6
Auricula, from a first-rate collection	1	0

A FEW VERY CHOICE NEW FLOWER SEEDS.

Leptosiphon luteum, fine orange colour; this very beautiful annual we would recommend, from its dwarf habit and novelty of colour, as a most attractive object for massing, packets, 1*s.* and	2	6
Linum grandiflorum rubrum, new crimson Flax	1	0
Nemesia bicolor, white and blue, very showy and attractive half-hardy annual, height 9 inches, beautiful for massing	0	6
Calceolaria chelidinoides, ex., clear bright yellow, fine for massing on lawns; the mouth being closed, it is not injured by wet	1	0
Lobelia Limburgensis, a new perennial variety from Prussia, extra	1	0
Portulacca aurantiaca, new orange, 1*s.*; nova rosea ...	1	0
Sweet William, very choice striped French	0	6

For a large number of new Flower Seeds, see advertisement in the *Gardeners' Chronicle* of Feb. 13th and 27th.

CHOICE IMPORTED SEEDS.

	s.	*d.*
24 superb varieties Dwarf German Stocks, 4*s.*; 12 varieties	2	6
Mixed, in 40 superb varieties, per packet ... 6*d.* to	1	0
Choice new brimstone, 6*d.*; dwarf carmine	0	6
*Fine new French, straw colour	1	0
10 Superb varieties, new large flowering	2	6
18 „ Wallflower leaved, or Prussian ...	3	6
New white Wallflower leaved, very dwarf and fine, per packet ... ... 6*d.* to	1	0
6 Superb varieties Brompton Stocks	1	6
7 „ Emperor Stocks, lasting more than 4 years, and blooming 2 or 3 times a year	2	0
New White Emperor, very choice, per packet	1	0
12 Superb varieties German Aster	2	0
12 „ Globe-flowering Aster	2	0
12 „ Pyramidal Aster	2	0
12 Very fine French Pæony, flowering varieties; these are extraordinarily fine	5	0
Mixed do., per packet	1	0
6 Superb varieties Zinnia elegans	2	0

And other fine Imported Seeds. See Catalogue.

☞ Goods CARRIAGE FREE with orders of 20*s.* and upwards to London, Ipswich, Norwich, or any Station on the Line.

Remittances are requested with orders from unknown correspondents. Post-office Orders to be made payable to BASS & BROWN, or to STEPHEN BROWN.

The Autumn and Spring Catalogues supplied free by post for three penny stamps each, the cost of which may be deducted from orders sent.

BASS & BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

ESTABLISHED ABOUT HALF A CENTURY.

PINUS SABINIANA,

THE GREAT HOOKED CONE PINE OF CALIFORNIA.

PETER LAWSON AND SON, Edinburgh, have just received from San Francisco a small consignment of Seeds of this fine Hardy Pine. Price 2*l.* 2*s.* for 100 selected Seeds, free by post. They were gathered last autumn, and are in excellent condition and well grown—the seeds measuring about 1 inch in length. Being perfectly hardy, they may be sown in a dry sheltered situation in the open air.—Edinburgh, March 4.

PRIMULA SINENSIS MAGNUM BONUM.—Was raised by Mr. Hayes, of Edmonton, by whom it was named and exhibited at the Horticultural Society's Rooms in Regent Street, the entire stock of which we purchased. The colour is far superior to the finest fimbriated purple variety; indeed, it has the richest shading of purplish crimson one can imagine. The eye is large and very conspicuous, of a beautiful yellow. The fimbriation of the flower is so fine that it has more the appearance of a double flower. The habit of the Plant is very robust and vigorous; the leaves have a remarkably stout footstalk with thick leathery foliage, and instead of the plant degenerating after the first season's flowering the fimbriation of the flower is much improved and the foliage of a handsome formation. One surprising feature of this plant is, that the Seedlings have all flowered correctly for three generations. Young Plants are now ready for delivery, price 10*s.* 6*d* each.

N.B. On account of the seed being sown late, the plants are too small to be allowed to flower this season, as the consequence would be a very poor flower, not distinguishable from the ordinary varieties, but the plants should now be potted and grown on freely from this time for the ensuing winter, by which time they will produce splendid specimens of the most gorgeous coloured flowers in cultivation.

E. G. HENDERSON & SON, Wellington Nursery, St. John's Wood.—March 4.

GERMAN DOUBLE DAISIES.—A fine healthy stock of the above unique Flower is now offered to the Public. It is very novel and distinct, and such as will give all purchasers satisfaction. Out of the 100 imported varieties, 50 of the most striking and best flowers have been selected, and can be sent out from one dozen plants, and upwards. These Daisies surpass everything for making edgings to flower beds, &c., and are quite a novelty of their kind; price 3*s.* 6*d.* per dozen, postage and package free; or 1*l.* 1*s.* per hundred, hamper and package free.

Also a fine stock of MYOSOTIS VANGLEEKI, or the new improved Forget-me-Not, well adapted for rock-work or making single beds; 2*s.* 6*d.* per dozen, postage free; 15*s.* per hundred, package free.

SWEET WILLIAMS.—A fine stock of very select and striking varieties 2*s.* per dozen, or 10*s.* per hundred, package free.

CHOICE HOLLYHOCK SEED saved from all the best and latest varieties yet sent out; 1*s.* 6*d.* per packet.

SEEDLING ANTIRRHINUM SEED, all from striped and spotted flowers, and will give every one satisfaction; 1*s.* per packet.

GERMAN ASTER SEED, saved from all first prize flowers 1*s.* per packet.

STRAWBERRY PLANTS.—This is an excellent opportunity for those to plant who may have neglected to do so last autumn. Victoria, 5*s.* per 100; Prolific, 3*s.* 6*d.* per 100; Eleanor, 3*s.* 6*d.* per 100; Surprise, 3*s.* 6*d.* per 100; Cremont's Perpetual, 5*s.* per 100; and many other leading varieties, package free. The above named will be sufficient to give a supply of fruit the whole of the Strawberry season, being the earliest and latest varieties.

CUCUMBER and MELON SEEDS can be still supplied in varieties, and price, as advertised on the 18th inst. On receipt of a money order, or penny postage stamps, the whole, or any part of the above, will be immediately forwarded.

EDWARD TILEY, Nurseryman and Seedsman, No. 14, Abbey Churchyard, Bath, Somerset.

CEDRUS DEODARA AND ARAUCARIA IMBRICATA.—The beauty and unique character of the above hardy and most ornamental of all Evergreen Trees are too well known to admit of any comment. Our plants are grown within 500 yards of the wash of the Sea, in this the most eastern point of England, and consequently fully exposed to the gales of the North Sea and German Ocean, which they stand with impunity; it is, therefore, obvious to noblemen and gentlemen who purpose planting their Marine Villas and other exposed situations, that they will not meet with that disappointment so frequently attending plants reared in milder counties. We submit the following scale of prices for robust, handsome, and well-formed plants, either in or out of pots:—

CEDRUS DEODARA.

Per dozen.—*s.* *d.*		Per dozen.—*s.* *d.*	
4 to 6 inches	6 0	2 to 2½ feet	30 0
12 to 15 inches	12 0	3 feet	42 0
1½ to 2 feet	20 0	3½ to 4 feet	60 0

Large specimens, 15*s.* to 21*s.* each.

If 100 or more of the above be taken, a considerable reduction will be made.

ARAUCARIA IMBRICATA.

4 inches	Per doz. 6*s.* 0*d.*	1½ to 2 feet	Per doz. 60*s.* 0*d.*
1 foot	„ 30 0	2 to 2½ feet	„ 80 0
1 to 1½ foot ...	„ 42 0	Large specimens up to 4 feet.	

For particulars of their Collection of Conifers, see Advertisement of October 22.

Catalogues will be forwarded free on application. Orders of 2*l.* and upwards are delivered Carriage Free to London or Hull, or to any Railway Station within 150 miles of the Nursery.

YOUELL AND CO., Royal Nursery, Great Yarmouth.

MR. LOWE'S ingenious application of COLLODION to horticulture (see p. 84) is one which may lead to more important results than even its author anticipates; for it is a substance easy to prepare, and applicable under circumstances in which no other known substance is available. Its properties are wholly innocuous, so that living tissues are in no degree affected by it injuriously. It dries with such

rapidity that parts treated with it may be secured while held in the hand of the operator. It is practically indestructible, as is shown by the fact that on cuttings being taken out of the ground at the end of a month the collodion was quite as sound as when first applied. It is impenetrable by water. Moreover, while it forms an impermeable layer, or a tough firm adhesive plaister, it is in its nature so yielding as to offer no impediment to the distension of tissue or the penetration of roots. No other known substance, applicable to horticultural purposes, possesses the same qualities. If the discovery of caoutchouc furnished a new arm to surgery, so in like manner collodion promises to give the gardener a new power which any man may wield.

Mr. LOWE's experiments were chiefly directed towards propagation. Believing that the great difficulty attendant upon the multiplication of plants by cuttings arises from the tissues rotting by the excessive introduction of water, which the cuttings cannot decompose, or throw off as vapour, it occurred to him that if the fresh end of a cutting were smeared with collodion the injurious access of water would be cut off, and the risk much diminished. The result of his experiment confirmed his anticipations. Out of 26 collodionised cuttings of stove plants 23 grew, while only 12 out of 26 grew when the collodion was omitted. In like manner, of 33 collodionised cuttings of greenhouse plants 23 grew, but only 11 out of the same number took in the absence of the collodion. Similar results attended other trials. It is probable that the failures in the process were ascribable to what seems to be an imperfection in his process. If instead of merely covering the cut *end* of the cutting with collodion, he had in some cases covered the cutting itself, as far as it was plunged in the soil, he would perhaps have had still greater success. There are two kinds of cuttings which are likely to demand this treatment—the one succulent or very *soft* plants, which absorb abundantly through their skin; and the other *hard-wooded* plants, of little substance, which become exhausted by the drying-up of their organizable matter, before roots can be formed. And upon looking to the details of Mr. LOWE's experiments this supposition seems to be confirmed, for the only three failures among his stove cuttings were 2 Gloxinias and 1 Achimenes, both very *soft* plants; and the ten failures among greenhouse plants were 1 Boronia, 5 Polygalas, 1 Epacris, *hard*—with 1 Swainsona and 2 Plectranthus, *soft*. We do not insist upon this theory, but it seems to deserve examination.

The other application of collodion was to stop bleeding, which was readily effected by smearing wounds, immediately, with the substance. To this operation, the difficulties attending which all gardeners well know, the new substance seems admirably adapted, by reason of its adhesiveness, its impenetrability, and its excessive toughness. Whether it will stop the bleeding of Vines, Walnuts, and similar trees requires to be ascertained, and we trust will this year be made the subject of experiment.

For grafting delicate subjects it will probably be found more valuable than even for cuttings, inasmuch as it renders a ligature unnecessary. Instead of tying a piece of bast round a scion to hold it in its place, it seems to be only necessary to paint the junction with collodion two or three times, in order to ensure the immobility of the scion; and if a good part of the surface of the latter is also so protected, the chance of success must be greatly increased. Herbaceous grafting may be expected to be rendered far more easy of execution by this method.

It is also a question whether it may not be advisable to paint with collodion valuable cuttings sent to the Colonies. The great difficulty with them is to prevent their drying, against which damp Moss, liable on the one hand itself to dry and on the other to become mouldy, or India-rubber, are now employed as preservatives. They, however, answer imperfectly, and it is worth ascertaining whether a good coat of collodion would not be far better.

Intelligent cultivators will not fail to perceive other means of applying this substance with a chance of success, and we hope to hear, in the course of the coming season, of many trials of it having been made under various circumstances. Any chemist or surgeon can supply ether and gun cotton, the materials from which collodion is prepared, and, we have no doubt, would willingly explain how the latter is to be made; for made it must be as it is wanted, the rapid evaporation of the ether rendering it impossible to keep it prepared for use.

IT is reported, upon what we believe to be good authority, that the deputy surveyorship of the FOREST OF DEAN, which has so long been vacant, is at last filled up by the appointment of Mr. JAMES BROWN, the successful manager of Mr. DUNDAS's woodland property at Arniston. Should this rumour prove to be well founded, and if Mr. BROWN is indeed placed in charge of this forest, with such support and authority as he has a right to expect, and as he must have if it is to be reformed, we may then hope to see a rational system of management introduced into the rest of the Royal woods, and a respectable income permanently derived from them, in return for the vast sums they have cost the country.

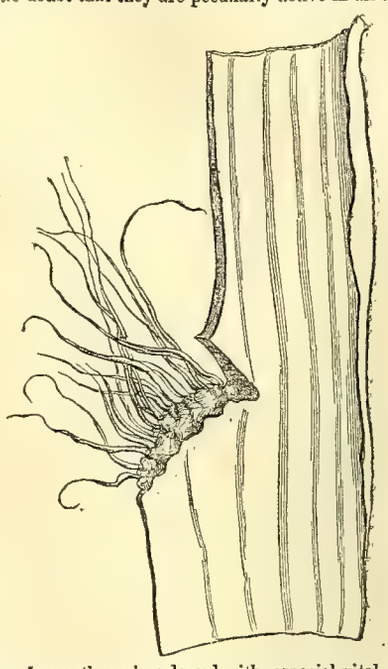
But while we receive with satisfaction this admission on the part of the Treasury that the previous system of placing public property in the most incompetent hands they could discover, is no longer to be persevered in, we must not conceal our conviction that the deputy surveyors in charge of other forests will never be able to fulfil the expectations entertained by those who are familiar with the management of woodlands. All that we have read or heard of them, with one exception, leads irresistibly to the conviction that, even supposing them to be animated by the best spirit, they do not understand the duties with which they are charged. They had no acquaintance with forestry when appointed; they have become accustomed to a miserable routine, out of which inveterate habit forbids their escape; and we fear there is, we will not say no hope, but, no possibility of their amendment. We wish them no harm. They are to be pitied as much as blamed, for they have been placed in a position of insurmountable difficulty by injudicious patronage. But such considerations must not shut our eyes to the injury the public sustains from their remaining in employment. Surely it would be better to allow them to retire upon full pay than to continue in their present offices. Their trifling salaries are of no moment, for the Crown loses infinitely more by retaining their services; and it is only by their removal, to be replaced by efficient men, that the Royal Woods and Forests can be regenerated.

A correspondent tells us that Mr. EDWARD MACHEN, formerly deputy surveyor of Dean Forest, has printed a vindication of his management, while in office. Such a document would be interesting, and for Mr. MACHEN's own sake ought to be placed in the hands of those who have expressed their dissatisfaction upon this subject. For ourselves we are not a little curious to know in what way the writer contrives to explain away the official revelations which we formerly described, and which immediately led to his resignation.

VEGETABLE PATHOLOGY.—No. IX.

27. THE bast-cells consist of extremely elongated and occasionally branched tissue, forming distinct bundles, in the bosom of which arises the peculiar tissue known by the name of vascular. They form when of sufficient length the threads which give the economic value to flax and hemp. They elongate with the growth of the part in which they are developed without forming new cells. Their walls are often greatly thickened, and exhibit simple tubular punctures. They often contain coloured milky fluid, and occasionally more solid matters in suspension.

28. Besides the layers of additional matter of which we have spoken, there is another kind of deposit by which the cell walls are greatly modified. It is very probable, indeed, that a spiral deposition takes place in the construction of the layers of which cell walls in general are composed, as is very visible in the bast cells of many plants in which spiral folds or lines are exhibited crossing each other so as to make a network from the contrary direction of the arrangement in two consecutive layers.* But besides these layers, there is a peculiar deposit, often of a green hue, and of a different chemical nature, which in many cases assumes the form of a continuous spiral thread, either simple or compound. By easy gradations, which it is not necessary to enter upon here, the volutions of the spiral form perfect rings, or, by the confluence and anastomosing of two or more threads, reticulated tissue. These cells, placed end to end, ultimately form, by the more or less complete† absorption of their dissepiments (whether horizontal or oblique), a continuous tube, in which state they constitute true vessels. Cells, however, occur in other and exposed situations containing perfect spirals, as in the seeds of *Maurandya* and *Collomia*. When young, they can scarcely be distinguished from the immediately surrounding cells; but soon after the formation of the spiral deposit, their protoplasm entirely vanishes, and they contain merely air. There is little doubt that they are peculiarly active in an early



stage of growth, and endowed with especial vital energies, as they seem more especially connected with the formation both of new roots* and buds. In some instances, after having performed their own peculiar office, whatever that may be, they are filled with parenchymatous tissue protruding inwards, and thus become reservoirs of nutritious matter, destined for the supply of the expanding buds or young fruit.

29. Vessels also occur distinguished from these by the absence of any spiral, but with canals communicating with intercellular cavities. These are sometimes transverse and greatly elongated, and simulate under superficial observation some modification of spiral vessels. These are often distinguished from spiral vessels by the name of ducts.

30. True pores penetrating the cell walls are very rare. They exist, however, in the spiral cells of *Sphagnum*, and in the dissepiments of vessels, as mentioned above. In either case they arise from partial absorption of the membrane. *M. J. B.*

* In a piece of drift wood belonging to some Conifer picked up by Capt. Inglefield, R.N., at Lake Laura, on the western side of the upper portion of Wellington Channel, many of the bleached woody cells exhibit a spiral structure, exactly like that of bast cells. In some cases there is only a single spiral, in others the spirals decussate each other. In one case the spiral arrangement consists of mere folds in the membranous wall. It may not be uninteresting to remark that spiral marks may sometimes arise from mere accident. In proof of this it may be mentioned that we have seen the surface of a roll of cotton, in consequence of a sudden fall, divided into the most regular diamonds by a double spiral line, so as to resemble closely the model of some fossil plant. Dr. Caspary has lately published in the "Botanische Zeitung" some remarks on the folds which sometimes occur in the walls of cells.

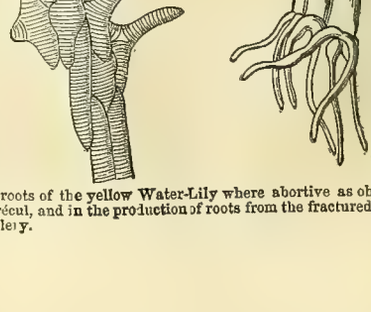
† The dissepiments, especially when horizontal, are frequently perforated with one or more orbicular pores, and sometimes with oblong fissures simulating scalariform tissue.

ARDISIA CRENULATA.

WHEN well grown, this useful stove shrub forms an object of considerable beauty during the greater part of the year, being almost always covered with pretty coral-like berries. It succeeds perfectly in a compost consisting of equal portions of good turfy loam and peat, with plenty of silver sand, and lumpy bits of charcoal or broken crocks intermixed, to secure an open condition of the soil after the decay of the fibre has taken place. The loam and peat should be well broken up, so as to ensure its being nicely intermixed with the sand, and in potting care should be taken to drain the pots properly, placing some rough pieces of the soil over the crocks so as to prevent the finer particles being carried down and stopping the drainage.

Propagation is easily effected either by means of seeds or cuttings, which root readily if selected in a rather soft state and planted in well drained pots filled with sandy peaty soil, covering with a bell glass, to prevent excessive evaporation, and plunging in a sharp bottom heat. Remove the glasses occasionally and wipe them dry, and keep the cuttings shaded from bright sunshine, and properly supplied with water. As soon as it is found that roots have been emitted, which will readily be perceived by the growth of the cuttings, pot them singly in small pots and plunge them in a brisk bottom heat near the glass, in a pit or house where a moist warm temperature can be maintained; keep them shaded from bright sunshine, and properly supplied with water at the root, syringing them freely on the afternoons of fine days. A shift into larger pots will soon be required, and this should be attended to as soon

* In the case of the formation of new roots, the vessels are sometimes singularly branched and distorted, as in the adventi-



tious roots of the yellow Water-Lily where abortive as observed by Trécul, and in the production of roots from the fractured leaves of Celery.

as it is found that the roots have reached the sides of the pots. Replace the plants in their former position, and continue the same treatment till towards October, when the atmosphere should be kept cooler and less humid, and a freer circulation of air afforded, to ripen the wood and induce a state of rest. Be careful not to overwater during the winter months, and place the plants in an airy part of the stove; or any situation near the glass, where a temperature of from 45° to 50° is maintained, will do very well. Towards March, place the plants in growing circumstances, and as soon as they show indications of starting into growth, examine the state of the roots, and if these are active give a liberal shift, clearing away sodden soil from the balls. If the plants can be plunged in a gentle bottom heat, this will greatly assist in inducing a vigorous root action, but be careful to keep them near the glass, in order to secure strong robust growth. Beyond a stake to keep the leading shoot straight, very little attention will be required in the way of training, but if any of the side branches should incline to grow too rapidly for the others, these should be stopped. Keep the plants properly supplied with water, afford them a moist humid warm atmosphere, with a slight shade from the midday sun on bright days, and attend to potting as may be necessary, and they will make rapid progress during the season. If very large specimens are desired, it will be advisable to remove the flowers as they appear during the first and second seasons' growth; but with good management they will be nice sized specimens, and may be allowed to flower the second season. When the berries get coloured the plants may be removed to a close corner in the conservatory, where they will contrast well with other plants; and if the temperature averages from 45° to 50°, they will remain in beauty during the winter and spring months; for such is the tenacity with which the berries hang upon the plants, that those of the current year follow close upon those of the preceding, and thus the plant is an object of interest the year round. It will be necessary to annually grow the plants in a warm moist situation, for which purpose they should be removed from the conservatory about April, and care must be taken to keep the foliage free from scars, clean and healthy. By occasionally repotting and supplying the specimens with weak clear manure water, they will grow to a great size, and last for many years. Few plants are more suitable for the amateur cultivator than this, for with a very little attention it may be grown in the greatest perfection, and it is at all times extremely ornamental, for even when no fruit is to be found on it, the deep green healthy appearance of its leaves will always command attention. *Alpha.*

TRADE MEMORANDA.

WHAT is J. Swift of Nottingham? We know that a gentleman of this name lives in a cottage at 4, Leuton Square, Leuton Street, a very mean court; and that he favours booksellers, grocers, stationers, and nurserymen with extensive orders. What, then, is the real nature of his business?

Home Correspondence.

Forcing Seakale.—There are two points in Mr. Bundy's remarks on this subject (see p. 117), so much at variance with the principles and practice of good gardening, that I think they should not be allowed to pass unnoticed. He recommends 6 or 8 inches of soil to be put on the dung; and before laying in the plants, to cut away all large roots, &c.; thus removing the chief source from whence the organisable matter is to be drawn, and at the same time only providing 6 or 8 inches of mould for any new fibres which the exhausted roots may throw out. I have frequently found the new fibres upwards of 2 feet down, in beds made up, and the dung placed at the sides, the produce being as large and heavy as that grown from unremoved plants in the natural way. The plan recommended is largely adopted by the market gardeners who grow Seakale for the London markets, but with this important difference, they are very careful to take up the plants with as much root as possible, and to provide two or three times as much soil for their reception as recommended by your correspondent. *S. S., Deptford, Kent.*

Autumn Dried Potato Sets, v. the Disease.—The Italian method of preparing Potato sets (see p. 92), communicated to the Royal Agricultural Society by Lord Palmerston is no new idea. Several of your correspondents (and myself amongst them) have tried the plan with success, and the results have appeared in your columns. As it is possible there may be something new in my method of treating the sets, I send a couple of them as samples, and a few words of explanation. As soon as the Potatoes require skinning before use, I have, after washing, a portion of the head of each cut off, an inch from the long kinds, and seven-tenths of an inch from the others. These are laid for about a week, with the cut side downward, on a board, to allow the new cuticle, which Nature creates, to be formed before their subsequent exposure. They are then strung with a large darning needle, and the two-coloured packthread used in shops, in lengths of about 3 feet, and suspended in an airy, dry, hot, light place, and left until it may be necessary to place them elsewhere to secure them from the frost. I have found a greenhouse, hot enough for the Oleander to flower in, to answer the best. These of course require no removal in the winter. When the frost is past, they may be suspended in a warm room of the dwelling-house to give them additional forwardness. The result is, that what is called the "rest" is over, and the short, dark, leafy shoots are ready to start forth into growth. No great heat is required for this. I placed some heads of the Walnut-leaf Kidney, thus treated, in earth in a cool place, and the roots shot forth at once. The tubers of plants from sets thus treated are formed and nearly ripened before the malady attacks the leaves and stem. The two samples are portions of Regents, the most backward I could find, to prevent the buds being rubbed off by hard usage in their journey. If you will examine the lower eyes of the larger one, you will perceive that three or more small shoots are bursting from each. This is not desirable, one strong shoot being wanted. The portion cut off, therefore, is unnecessarily large. A thickness of five-eighths, or of seven-tenths, of an inch would have sufficed. *L. S.*

The Manetti Rose Stock.—Your correspondent "An Old Rose Amateur," is mistaken in supposing that the soil of our nurseries is "too deep and rich" for this stock. Happily it is deep, and vegetation flourishes nearly alike in all seasons; but it is hungry rather than rich, and I may say, almost destitute of organic matter. I have certainly had no experience with this stock on a "heathy waste," concerning which your correspondent's testimony may be valuable. But I should hope that few Roses are destined to bear and suffer on such a soil. As regards the "remarkable vigour" witnessed at Darlington, if your correspondent will refer to my evidence against his favourite, he will find this "remarkable vigour" to be the strongest point against it. It would really be a service to the Rose-loving community, if such of your correspondents who have tried this stock would furnish the results of their experience, with names and residences attached. It can be no interest to a nurseryman to decry it, as it is produced easier and at less cost than the Dog Rose. Truth is what we should aim at, and surely it should not be difficult to establish the matter beyond controversy, when we consider the length of time this stock has been cultivated, and the numbers who have grown it. *William Paul, Nurseries, Cheshunt, Herts.*

Fungi on Lawns.—Would you kindly favour me with your opinion in the following case:—Three years ago I filled up an old reservoir (which had been previously drained) with spent dyewood, loppings of trees, and all sorts of rubbish, to the depth of 6 or 8 feet; upon these I laid 3 or 4 feet of sand mixed with clay, and then a few inches of soil, on which I sowed Grass seeds. In the autumn of the first year some fungus appeared, which has increased every year, particularly at that season. I should mention that part of the lawn is on a slope, and the lower part on a dead level, which is generally damp; the fungus is seldom seen except on the lower part, and that part is also mossy. I thought this spring of taking up all the sods, bringing in a quantity of sand and clay, and making the slope regular throughout. My idea is, after the slope is formed, to lay on about 6 inches of cinder, then 1 or 2 inches of soil, and then to relay the present sods, for I cannot procure any fresh. Do you think this plan would answer? I hope that by laying the lawn dry I may get rid of the fungus; at present the Grass is quite spoiled, for the fungi come in thousands, from the size of a Pea to that of a saucer, some are even as large as a boy's head; the former a light yellowish fawn colour and the latter a deep purple. Will the sods contain seeds that will germinate? *J. M., Prestwich.* [We will not undertake for your plan answering. A better way, since the old wood which breeds the fungus is so far off the surface, would be to uncallow the wood and kill the fungus by drenching it with a solution of corrosive sublimate in water.]

Rain at Castle Hill, Devon, in 1853.—

	Inches.		Inches.
January	4.15	October	3.30
February	3.26	November	2.87
March	1.77	December	1.28
April	3.61		38.93
May	1.41	For 1852	50.50
June	5.30		
July	5.13	Difference	11.57
August	3.07		
September	3.28		

The greatest quantity which fell in any 24 hours was 1.17 inch, on the 3d Feb. and preceding night. The greatest amount in 12 hours was 0.94 inch, which also happened on the 3d of February. The next largest quantity in 12 hours was 0.72 inch, on the 24th of April. The greatest amount of cold was on the night of the 29th of December, when the thermometer fell to 9°, or indicating 23° of frost. We had also 15° of frost on the 22d of November. *A. Saul.*

Tally Pins.—Though the decimal mode of notching number-sticks has long been recommended, it has not yet driven out of use the primitive system of our forefathers. This doubtless arises partly from the inexpediency of altering a custom already established in a garden, but it is also partly caused by a want of simplicity and a liability to mistakes in most of the plans proposed. Noticing in another place ("Turner's Florist" for Jan., 1854) a system offered, which though certainly an improvement on Seton's, is still open to objection on the score of the similarity of the characters, I venture to recommend the accompanying method as much simpler and more legible. Twenty years' constant use have satisfied me that there is very little chance of mis-reading it, and as the characters have a (rude) resemblance to written numerals, they are easily remembered;—thus in writing, 8 is formed of two O's, 6 of an upright stroke and O, &c. This matter is of more importance to gardeners than might at first be supposed; for, for real every-day use, there is no tally-pin so convenient and so durable as a notched piece of Larch or Oak. *Walter Sang, Kirkaldy.* [We do not publish a cut of this, because we are of opinion that Seton's well-known plan is quite as good as Mr. Sang's, or that in the "Florist," and we abhor needless reform.]

Covering for Rustic Seats or Summer Houses.—However neat and appropriate a covering of Heath, Reed, or straw may appear to be for the roofs of rustic buildings, of the kinds just named, every one knows that there are many inconveniences attending the adoption of each of these materials. Birds, rats, and insects colonise in all of them; and when decay begins they are exceedingly difficult to repair. Larch bark, put on in sheets, is excellent for the purpose. It has many qualities to recommend it; it can readily be procured in large pieces, it is rustic in appearance, quiet in the tone of its colours, by no means rapid in decay, and a roof so covered may, when necessary, be easily repaired without leaving an unseemly patch. I have not entered into an explanation of the mechanical operations required in procuring and adopting it; those, I presume, are obvious enough. *Crayon.*

Planting Oaks.—Your correspondent, "W. B. A's." statement (see p. 70) is incorrect;—he says, "The most modern and best method of planting Oak and Larch on sheltered situations, is to have them put in at about 4 feet over all, the Oaks at 10 feet and the rest filled up with Larch. Now, it will require no learned arithmetician to tell that 4 and 4 make 8—that 8 and 4 make 12; and that, consequently, by planting Oaks, or any other trees, at 10 feet apart, and then filling up the space between with other plants, set at regular distances, the distance from plant to plant would not be 4 feet; by planting Oaks, however, at 12 feet apart, which is quite close enough, the intermediate spaces can be filled up with other plants at 4 feet apart. Might I ask some of your correspondents who have had opportunities of observing minutely the various systems of tree management practised in the royal forests, to favour the foresters of Britain with some account of the peculiarities belonging to those systems which have been found so baneful in their effects upon the forests in question. By exhibiting the errors committed in our Crown woods, foresters in general would be enabled to steer clear of mistakes of a similar nature. Woodmen of extensive practical experience, perhaps, might not be greatly benefited by statements of this kind; but as a considerable extent of private woodland property is entrusted to the management of persons almost wholly unacquainted with the science of arboriculture, such statements would be of great service to them, and of still greater benefit to their employers. *A. P.*

Lily of the Valley.—It may not be generally known that this may be successfully cultivated in pots for forcing year after year. It must have kind treatment; but to have it in flower in the greenhouse or conservatory from the month of January until its usual time of flowering in the open air well repays the little attention it requires. This may be effected by attending to the following system of management:—The roots should be taken up for potting as soon as the leaves have decayed, in order to allow time for the formation of roots previously to starting them into growth. The middle of December is a good time to begin forcing this Lily, and a succession of flowers may be kept up by taking a few pots into the forcing pit every three or four weeks, as they remain a long time in perfection. When the plants have done flowering, they should be removed from the greenhouse to a cold pit or frame, where they can have plenty of light and air; and as soon as they have completed their growth, they should be set on a partially shaded border, protected from cutting winds. They may remain there until the end of October or beginning of November, when they should again be placed in the cold pit until they are required for forcing. When the plants are taken into the forcing pit they should be plunged in a mild bottom heat, and entirely covered with loose leaves, to exclude light until the roots shall have become active, after which they should be fully exposed to light, and given plenty of air. Plants treated in this way will not require to be repotted until the second season after they have been removed from the ground. And when it is necessary to do so the soil should be carefully shaken from the roots, and the plants re-potted into pots of the same size as those they came out of, or larger, as may be found requisite. Five-inch pots will be found to be a very convenient size in which to grow the Lily of the Valley, and the soil most suited to its wants is composed of turfy loam, leaf-mould, and sand. *G. F.*

Exterminating Ants.—I have a Grass lawn of about three-quarters to one acre, which is so infested with ants that to cross it is unpleasant, and to stand or sit upon the sod is out of the question. With the hope of banishing them I have had it broken up, and it is at present planted with early Potatoes, on digging out which I wish to lay it down at once if possible. Can any of your correspondents tell me how I may dispose of these little invaders. Would ammoniacal liquor have any injurious effect upon them? I had hoped that breaking the ground would have destroyed them; but this is the second crop I have had in it, and to all appearance they are as numerous as ever. *S. B., Dublin.*

Pinus Pinaster var. maritima.—When it is generally known that this Pine thrives well on the sea-coast, how is it that kinds wholly unfit for the situation are continually planted there? On a recent visit to Hastings I was struck with the vigour, freshness, and beauty of a small group of this variety in a plantation on the new

London road, high above and fully exposed to the sea. There were at the same elevation, and similarly exposed, the Spruce Fir, the Scotch and Austrian Pines, and the common Pinaster, whose condition would move the most stoical to pity—stunted, moss-grown, and so brown that one might almost think they had been singed with flame—they presented a striking contrast with the former. For the sake of beauty, I could not help wishing these maritimas had been more abundant; and surely as a question of profit it would be a good speculation to make them so, as the value of land by the sea-coast would be considerably increased by efficient shelter. *William Paul, Nurseries, Cheshunt, Herts.*

Burnt Clay a Material for Walks (see p. 117.)—The expense of burning must necessarily be regulated by the high or low price of coal, and the abundance or scarcity of clay. I have had 500 loads or square yards burnt within these last three months, and they have cost upon an average 1*s.* 8*d.* per load. I paid 1*s.* per load for digging and burning the clay; and I found 10 tons of small coal for every 100 yards of clay: let it be remembered that the coal must be very fine, with the exception of 1 ton of large to start the fire with. The coal cost 7*s.* per ton, so that fuel and labour put together will amount to something like the above sum. When known, the process of burning is very simple, although there is a little secret belonging to it of which every one is not aware, for if the heap (like that of burning charcoal) is allowed to blaze, the clay is consumed and reduced to ashes, which are not better than common burnt earth. On the other hand, if once too much stifled success is at an end, for it is very seldom that the fire can be restored to a good burning state; therefore, should you be unfortunate in this way it will be advisable to light another fire. *Gomer, Redland, Bristol.*

Hoitzia coccinea (see p. 104).—I regret that I cannot give you a correct statement respecting the management of the Hoitzia, from which I sent you a specimen, as I have only been in my present situation about six weeks. Six plants of it were growing in the stove here when I came—three of them were old ones, which had been cut back; the best had at least 30 spikes of bloom on it, all quite as good as the one sent. The plants were at least 3½ feet high; they had been grown in 8-inch pots, in a mixture of loam, peat charcoal, and red pit sand. The plant from which the flowering specimen sent was cut had only three spikes on it; it had been grown in a 3-inch pot, and was about 18 inches high. I think, from the habit of the plant, that it might be very much improved by being stopped once or twice in the early part of its growth, which had not been done in this case. They are now all cut down, and are breaking at almost every eye. *J. A. F.*

Cypresses.—May not the "weeping Cypress," mentioned in the following extract from the journal of the late Captain Trower, of the Indian army, which was lately lent to me in MS., be the same as the Cupressus funebris discovered at a later period in China by Mr. Fortune?—"Neemla, October 19th, 1842:—We passed the day under the beautiful plane trees planted by the Emperor Baber. The garden boasts of a tree that I never saw or heard of before, a weeping Cypress, a most elegant tree; I brought away many cones from it. 21st October:—At Balabagh is another of the imperial gardens, in which are many trees planted by Baber himself. In it are two enormous Cypresses of peculiar beauty, and planted so close together that their branches entwine and most lovingly embrace each other. They are called from this circumstance by the natives 'Leila' and 'Mujnoon,' the names of the celebrated Eastern lovers." *W. C. T.*—[We are unable to answer this inquiry. Dr. Hooker, in one of his charming woodcuts, has figured a weeping Cypress at Doobdi, in Sikkim (I. 337), which we understand to be a portrait of a Cupressus funebris—not, however, wild here, but introduced into Sikkim from Tibet; p. 316.]

Irish Heating.—Mr. M'Sherry has set in my Vinery a single-cased heating apparatus, similar to that which was exhibited at the Crystal Palace in 1851, and approved of by you of late; he forms the upper cover of the flue, over the air case, of a plate-iron evaporating pan for water, 5 feet by 3, which, according to the fire, emits vapour or steam more or less. I shall be obliged by your informing me whether it would be proper to use the moisture the whole, or only a portion of the day, when the Vines are not flowering. When the water is out the pan gives off heat, and it is made so that a portion only can be covered with water; besides, there is in the warm air drain a long water pan, so that the air passing out may be recharged with moisture for what it lost in the heating process. Do you approve of the evaporating pan? *John Abell, Limerick.* [It is always desirable to have the command of water in the form of vapour, provided means exist of discontinuing it at will. So far as we can understand the plan described, it seems a good one, provided always that the evaporating pan is secure against splitting. Keep Vines moist by night, and leave them to themselves by day.]

Radishes from Constantinople.—We have had a letter from a friend of ours who has just been over to Constantinople and Varna, in which he states:—"When at Constantinople I saw some Radishes almost as large as Carrots. They were crisp, mild, and delicious. I tried to get some of the seed, but found the price was 1*s.* 3*d.* per drachm, or 20*s.* per ounce." Query. What sort could this be? *William E. Rendle and Co., Plymouth.*

Potting Plants.—I am of opinion that the depth of the generality of pots is not enough compared with their width; they are too shallow to allow of sufficient drainage being put in them, without which neither proper compost, caution in watering, nor any other attention will secure for the plant that healthy and vigorous appearance in which its beauty consists when not in flower. Now, in measuring a number of pots, I find upon an average that the depth is rather less than the width; for instance, a pot 12 inches deep is full that in diameter; now, after 4 inches are taken for drainage, over which there should be one inch of leaves or moss, 2 inches of coarse compost, and 1 inch more at least of a little finer soil, leaving 1 inch at the top of the pot for watering, it will be found that we have got just 3 inches to insert the ball in, and this leads us into two other errors, which are the result of the first, viz., the reducing the ball to 3 inches, which is mutilating the roots, or being compelled to give too large a shift, which does not suit many plants, more especially Heaths, Leschenaultias, Gompholobiums, and other delicate growing plants. It will be found in large shifts that before the roots have half penetrated through the soil the latter gets stagnant and sour, the roots become sickly, disease soon makes its appearance in the collar of the plant, and that death is next to certainty. I have lost several valuable plants in this way, and on examining the ball I have found the lower part of it very dry, while the upper portion was quite saturated with wet. Now the reason is that the greatest portions of the fibry roots proceed downwards, and are found over the crocks starved to death, while on the other hand comparatively few are at the top, and consequently are not numerous enough to absorb the moisture. I therefore trust that in future potters will make their pots a little deeper. *Gomer, Redland, Bristol.*

Bees.—I have just lost a hive, not from cold—as they were alive and about lately, but from exposure to damp. At the time of the late gale the hive was blown over; the bottom got wet, so that the bees who descended to feed were unable to ascend; the "sealing" round the bottom of the hive was also broken up. Am I to clear away the bees lying at the bottom, dead (?), or leave them the chance of reviving? As they are offensive many must be dead; but those which remain high up between the combs may be alive, and if so the effluvia will kill them. Will some of your correspondents help a neopiarian in difficulty? *Somerset, Feb.* 28.

Timber not a Profitable Crop.—Your leading article of the 28th Jan. will, doubtless, be so copiously replied to by correspondents confirming your denunciations of the manner in which the royal forests have been managed, that I fear any one taking up the cause of the forest officers will be liable to the charge of vindicating their mismanagement from personal motives alone. Be that as it may, I hope that those who charge them with a wasteful expenditure of the public money, or what is the same thing, neglecting to make the most of their trusts, will have the kindness to tell us what income woodland, in a general way, produces? I mean land that is producing timber. It would appear from your remarks that, as little timber fit for the royal navy has been supplied from the royal forests, their management must be bad. Now this statement requires some qualification; the great distance several of the forests are from the royal dockyards, or sea-ports from which the produce could be conveyed thither, acts as a barrier to deriving much profit from them; and the fact of the navy officers complaining of the quality of such timber as has been supplied to them, is a tolerable proof that the forests have been cut as severely as they could prudently be. But I do not regard that much. What I want to know is, "Has woodland in a general way proved itself to be a profitable investment for capital?" And have crops of Oak and other trees been as remunerating as those of corn and Grass? Until this is proved, we should withhold our censure from the forest officers. I have been many years connected with woodlands in several counties, and I have always found such a bulky commodity regulated in price by the local demand for it, but even in the districts where there was most demand, the return was never in proportion to what the same land would have commanded under agricultural crops. Observe, I allude to timber, and not coppice. Now, I ask, how is it possible for the Government officers to present a better balance-sheet? Doubtless, some neglectful manager may have deteriorated some part of the forests; and it is possible that some corrupt practices may have operated against the income being larger; but still I inquire, can woodland be made to pay, and where and when has it done so? I fancy our small landed proprietors would plant more if they were convinced of its being a profitable investment; and as many of them are tolerably shrewd observers of such matters, and generally well versed in cultivation of other things, crops of timber would be as common as crops of grain were they equally productive of a certain pecuniary return. If no one replies to your inquiries, I will, with your permission, add a little more hereafter, in confirmation of my views of woodland being only profitable under peculiar circumstances, such as on inaccessible places, &c. *L. M. N.* [If you will inquire of the agent of Mr. Dundas, of Arniston, you will learn that forests pay well—a clear profit of 40*s.* an acre, for instance. Nobody imputes corrupt practices to the surveyors, we merely complain of their utter incapacity. If you have read the remarks we formerly made with ordinary attention, you will find that your suggestions are not at all to the purpose.]

Botanical Garden at Palermo.—There is a beautiful building at the entrance with circular lecture room, in which there were students. The situation is lovely, but all situations are lovely here. Professor Tenore told me that the climate enabled him to grow everything; the Mespilus japonica he says is the most delicious fruit, except that which is the triumph of the garden, the Custard Apple, which ripens in it, and so do the Bananas. The Psidium they do not like. He introduced the Tangerine Orange (here called Mandarine) and now it brings in 20,000 ducats; he hopes to naturalise Bananas and Custard Apples. The Mespilus is sold in the markets in the season; they send Peas and Artichokes now as far as Genoa. There is a so-called stove, but there is never any fire in it, and all the doors and windows were open yesterday, though, for this country, it was not a warm day. He has several small greenhouses, and is going to fit up a place for Orchids. I find that it is in April that the burst of vegetation and flowers is to be. The Professor showed me a Stapelia found here, but he says that, and several other plants found here, are, in fact, African. He is busy hybridising his newly found Scillas, and promises to send you these, which are, he says, magnificent, finer than Peruviana, and with them the Orchids of Sicily, Crocuses, hybrid Amaryllis, and hybrid Crinums. He is lord paramount in the garden, for there is no one here who cares to interfere. The Bougainvillea had climbed over the immense house, and he tells me he has two others—one golden, the other red—probably that one which Humboldt mentions. *Extract from a Letter from Palermo.*

Wellingtonia.—Should not the scientific men of Europe entreat the Government of the United States to protect from destruction the few specimens that remain of their wonder of the vegetable world? It would be a sad thing if these giants, trees which have been (if the calculations are correct) thousands of years in attaining their present growth, should be at the mercy of any money-making speculator. If the ground on which they stand is not national property it should be purchased for the nation, in order to preserve them, and to form the nucleus of an arboretum worthy of the Union. *W. C. T., Wallington.*

Walters' Open Spade.—About three years ago I took a large piece of heavy land, and on going to it at various times to see the men digging it up, it struck me that the tool they used, the old common flat spade, might be improved in such a manner as to lessen the strength required to force it, clodded with mud, into the soil; and the time taken up in cleaning appeared to me of much importance. This caused me to invent an open spade. The first I had made differed from that I now use; thus the plate or pit at the point was only 1 inch deep, which gave way and broke at the corners. I had another made with the plate 2 inches deep, which answered better, but in this one I could see room for improvement. I had another made with round bars at the sides, instead of square bars; this answered to my entire satisfaction, and now I feel much pleasure in recommending to the gardening world an improved spade, of such construction as may be used in moist weather, or in the most tenacious soil; from morning until evening, without any cleaning; and it is well adapted for bringing up portions of subsoil, which is so essential to good cultivation. My contrivance is fast becoming a favourite tool in my locality; some of them have been taken from here to America, Ireland, and Wales, where I have no doubt their value will be recognised. The labourer looks with pleasure on his new spade, which relieves him from much of his hardest labour; and, in addition to its ease of working, I think that this spade will effect a saving of something like ten per cent. Their cost is from 2*s.* 6*d.* to 3*s.* each, and they can be made by almost any common smith.—*S. Walters, Hilperton, near Trowbridge, Wilts.*—[This spade appears to be nothing more than an open square frame, three sides of which are made of five-eighths of an inch iron bar, and the fourth side, or that which enters the ground, consists of a steel plate, 2½ inches in width, all the rest of the plate of the spade being absent. As to size, that is left to taste; but a spade 12 in. by 7 in. is stated to be a full-sized one. The bends in the handle and plate are about the same as those in the ordinary spade.]

Yellow Rose.—A paragraph about a yellow Rose in the *Gardeners' Chronicle* of the 26th November last has recalled to my recollection that I had gathered the plant in India, and I have the pleasure to enclose you a specimen for your herbarium, by means of which you will probably be able to ascertain to what species it belongs. The specimen sent was gathered in the district of Kishtwar, in the interior of the Punjaub Himalaya, in the valley of the Chenab river, at an elevation of about 8000 feet, apparently wild, but so near a village that I had some doubts on the subject, especially as I saw it once only, and afterwards met with the same species cultivated and double in Ladakh. A yellow Rose has, however, long been known as indigenous in the Thibetan district of Lahul, higher up the Chenab river than the spot where I got the specimen sent. I first heard of it from my fellow traveller, Major Cunningham, who was the first after Moorcroft to traverse that wild region, and it attracted the attention of every traveller who passes through that province at its flowering time. My specimens, if not wild, were doubtless imported from the upper parts of the valley. The species seems the same with one already in English gardens. There is also, in the Hookerian Herbarium, a specimen undoubtedly of the same species, from the Bakhtyari mountains, Persia, collected by Mr. Loftus. *Thomas Thomson, Kew.* [This is one of the Rubiginosa section; but we are unacquainted with it.]

Societies.

LINNEAN, *Feb.* 21. — The President in the chair. Specimens were presented of Ophioglossum lusitanicum, from the island of Guernsey, by the discoverer, Mr. G. Wolsey ; and a small collection of Ferns from Moreton Bay, by R. Wakefield, Esq. Mr. Joseph Robson, of Whitehaven, was elected an associate. The following papers were read : — 1. "Notes on some Ferns in the Wallichian Herbarium," by Mr. Thomas Moore. The Wallichian species to which this paper referred were the Prionopteris Farquhariana (Wall. Cat. 184), Sphæropteris Hookeriana (Wall. Cat. 775), and Davallia stipellata (Wall. Cat. 260). The first of these, which appeared to be unknown both to Presl and Fée, was stated to be the Matonia pectinata (R. Brown in Wallich's "Plantæ Asiaticæ Rariores"). In enquiring which of these names had precedence, the author referred to Sphæropteris barbata, as an analogous case, which also occurs in the "Plantæ Asiaticæ," where precedence is claimed for the herbarium name of Dr. Wallich, dating 1823, and catalogued in M.S., in 1828, over the name Peranema, of Don, legitimately published in 1825. This claim, strengthened as it is by the general adoption by botanists of Dr. Wallich's names, led the author to the conclusion that they were entitled to precedence ; and according to this view, Prionopteris must supersede Matonia. Sphæropteris Hookeriana, Wall., was stated to be undoubtedly the Diacalpe aspidioides, Blume, distinguishable from true Sphæropteris by having sessile not stipitate sori. Restoring the Wallichian specific name, this was called Diacalpe Hookeriana. The Davallia stipellata, Wall., was identified with the Aspidium nodosum, Blume, the Acrophorus nodosus, Presl, and doubtfully with the Monachosorum davallioides, Kze. The fructification of this Fern, consisting of small heaps of spore cases at the apices of simple venules within the margin, and covered by roundish scale-like indusia attached by the base only, it was argued that it could not properly be associated with the Davallieæ, but should rank along with Cystopteris in a subsection of Aspidieæ, connecting that group with the Davallieæ through the genus Microlepia. The genera Acrophorus and Leucostegia of Presl, of the latter of which Presl himself says "Acrophoro affinissimum est," were held to be too closely allied to be kept apart, and the author therefore proposed to combine them, applying to the united group Presl's prior name of Acrophorus. The following species were communicated :—Acr. stipellatus (A. nodosus, Presl) ; Acr. immersus (Leucostegia, Presl) ; Acr. chærophyllus (Davallia, Wall., D. pulchra, Don) ; Acr. membranulosus (Davallia, Wall.) ; Acr. affinis (Leucostegia, J. Sm.) ; Acr. hispidus (Davallia, Heward) ; Acr. parvulus (Davallia, Wall.) ; Acr. jamaicensis (Davallia, Hook.). The attention of the author had been directed to the instance above referred to while prosecuting an attempt to arrange the genera of Ferns, so as to avoid alike the modern extreme of needless subdivision and the antiquated one of inconvenient aggregation. 2. "Note on the genus Ancistrocladus of Wallich," by G. H. K. Thwaites, Esq. Mr. Thwaites observed, that having had opportunities of examining the structure of the flowers of Ancistrocladus Vahli, as well as its fruit in various stages of development, he had been enabled to arrive at a more correct knowledge of their structure than appears to have been previously within the reach of botanists. The circumstance of the fruit in this genus being surmounted by the enlarged segments of the calyx had led to its being referred to the several families, Combretaceæ, Malpighiaceæ, and Dipteraceæ, from all which he stated it to be essentially different in its albuminous seeds ; and he pointed out the Symploceæ as a group with which it seemed to associate better, agreeing therewith in its undivided exstipulate leaves, in the character of its inflorescence, in its persistent calyx, in its imbricated calyx and corolla, in the stamens being adherent to the base of the corolla, in its inferior ovary, albuminous seeds, and cylindrical [? clavate] embryo. From the Symploceæ, however, it was stated to differ in its scandent habit, in its calycine segments becoming enlarged, in its solitary erect ovule, and in the peculiar cerebriform structure of its copious albumen. With the Myristicaceæ and Anonaceæ Ancistrocladus seemed also to have some affinity, its young ovule recalling to mind that of Myristica, and the embryo not being very dissimilar in the two genera ; whilst the scandent habit and uncinate ramuli give to it a considerable resemblance to Artabotrys. Mr. Thwaites concluded with a detailed generic character, partly drawn up from fresh specimens of A. Vahli, a plant which was stated to be abundant in the warmer districts of Ceylon, and owing to its abundant increase, by its roots, forming a very troublesome weed. Its Cingalese name is Gonawel or Gonapittanwel. The paper was accompanied by drawings illustrating the structure of the flowers and fruit of A. Vahli.

Notices of Books.

School Botany and Vegetable Physiology ; or, the Rudiments of Botanical Science. By John Lindley, Ph.D., F.R.S. A new edition, 8vo. Bradbury and Evans. Pp. 182.

THE favourable reception given to this work by the public has enabled the proprietors to increase largely the matter contained in the present edition, without augmenting the price. Between 60 and 70 woodcuts of common plants, and about the same number of new pages, have been added, among the latter of which will be found a chapter entitled "Physiological Aphorisms, or the Rudiments of Practical Physiology." The former editions were confined to Systematical Botany, physiology finding no place in them. That deficiency is now supplied. The foundation of the aphorisms was the author's "Outlines of the First Principles of Horticulture," a little work which has been out of print for many years ; but they have been curtailed, much corrected, and adapted to the purposes of general students, who wish to become acquainted with the common phenomena of vegetable life, rather than with their special application. The additions to the systematical part of the work consist of the distinctive characters of a certain number of common plants, to be met with everywhere, either in gardens or cultivated fields.

New Plants.

48. CYPRIPEDIUM VILLOSUM.

C. acaule, foliis immaculatis scapo villoso longioribus, spathâ carinatâ, petalis inæquilateris spathulatis undulatis ciliatis politis apice excisis, sepalo supremo emarginato antico oblongo apiculato, stamine sterili cuneato mucronulato dorso tuberculato pubescente, columnâ petalisque basi barbatis, ovario crinito.

This fine addition to an interesting genus was lately exhibited to the Horticultural Society, when it received a Silver Knightian medal. Mr. T. Lobb found it wild in the province of Moulmein, at an elevation of 5000 feet above the sea, and sent it to Messrs. Veitch, who, we believe, are its sole possessors. It most resembles *C. insigne*, differing more especially in the following particulars :—The scape is shorter than the leaves, and shaggy, with long purple hairs ; the petals are singularly unequal sided, the posterior half being twice as broad as the anterior, and much undulated ; they are, moreover, notched at the point, as if a piece had been struck out by a circular punch ; the lower sepal is apiculate, and not merely obtuse. There is a general resemblance in colour, but the upper sepal, instead of being decorated with dark circular spots, has merely a deeply discoloured set of veins along the middle, and the petals, which look as if varnished, are a rich warm brown on the upper or posterior half, but green on the lower half, with a deep rich brown line of separation.

Garden Memoranda.

HORTICULTURAL SOCIETY'S GARDEN, TURNHAM GREEN. —The fine specimen of Dendrobium speciosum, which this garden possesses, is now in flower ; but not nearly so profusely as it was last year. Nevertheless, owing to the large size and rude health of the plant, together with the great beauty of the few fine spikes of flowers that at present ornament it, it must be regarded as an object of unusual interest. Among the more conspicuous of other Orchids in bloom were Cœlogyne cristata literally covered with handsome white blossoms, stained in the lip with yellow ; the White Butterfly Plant (Phalænopsis amabilis) ; and the well-known Phaius grandifolius, which when well flowered, as this was, is still one of the most striking and useful plants we possess.

In the greenhouse adjoining the Orchid-house were some charming potfuls of Crocuses, more especially those filled with Queen Victoria and Sir Walter Scott. The latter is a very fine flower, white striped and feathered with lilac, and about as large as a small Tulip. Well-bloomed masses of the finer kinds of Crocuses, we need scarcely say, are extremely showy at this season of the year, and they are easily obtained by potting them in autumn, and wintering them in a cold frame, merely placing them in a little heat a short time previously to their being wanted in flower.

The Acacia trees, for so they have now become, in the great conservatory, are beginning to be very gay. A. cyanophylla is now in full beauty, and several others are ready to succeed it ; A. Riceana is getting past. These are large-growing kinds, which are suitable only for a house like this. For pots, A. linearis, a specimen of which was in full flower, is very suitable. The scarlet and white Brugmansias, which have recently been cut "hard in" and cleaned, are again loaded with blossoms, and Habrothamnus fasciculatus, and Polygala gracilis, are also both in full flower, together with the fine group of Camellias near the east end of the house. Among the latter, C. elegans is by far the most striking, the multitudes of large blossoms with which it is furnished being just in perfection. The little scarlet Azalea obtusa makes a handsome plant for a shelf, and it forms a good succession to the variety of A. squamata, mentioned at p. 118, whose distinguishing characteristics are the delicacy and transparency of its blossoms and its habit of flowering naturally, *i. e.* without forcing, several weeks before any other Indian Azalea. On this account, therefore, it must be looked upon as an acquisition.

The Rose trees have all been moved out of the Rose house, and transplanted in Messrs. Hartley's conservatory, in which beds have been prepared for them, and where they are expected to succeed much better than they have hitherto done. Climbing sorts have been placed against the pillars, which, together with the roof, may thus be rendered ornamental. The Rose house, we understand, is to be converted into an orchard-house, which is to be devoted in part to proving of Vines and Figs in pots.

The alterations in the Arboretum are now completed ; the Grass is being mown and the borders dug and put in order for summer. The Rhododendron beds, which have been altered, have not been wholly replanted with the same kinds of Rhododendrons they formerly contained ; they have received some important additions in the shape of some of the newer and higher coloured varieties, into which has been infused, by means of skilful cross-breeding, a habit of flowering sufficiently late to be out of the reach of early frosts, which, we need not say, spoil the blossoms. Many of these, we learn, have been kindly presented to the Society by Messrs. Dancer, of Fulham, and Mr. John Waterer.

In the orchard department, pruning forms the principal occupation at present. Another sash has been added to the length of Cottam and Hallen's Peach frame, and its hitherto open ends, we believe, are also to be shut up. Close ends formed no part of the original design ; but owing to the short length of the frame in the present case allowing cold winds to sweep through it, they will doubtless be found to be an improvement.

The effects of the late frosts have been severely felt in the kitchen garden. Even Brussels Sprouts in some instances have been injured. Those that had not been topped have been found to stand best. Among Broccolies, Snow's Spring White has, upon the whole, stood best. Hammond's White has been all killed, and of Cock's only a plant here and there remains. Spring cropping is now being proceeded with. Some Potatoes have been planted according to the plan mentioned in our Number for Feb. 18, p. 101, with a view to further test its value as a preventive of disease. Little ridges of earth have been left between the rows for the purpose of covering them when the time stated for performing that operation shall have arrived, and every pains will be taken to give the plan a fair trial.

FLORICULTURE.

PANSIES IN POTS.—My three-light box is again becoming gay with these delightful spring flowers. Duke of Norfolk, Sir Philip Sidney, Disraeli, Ophir, Robert Burns, Euphemia, France Cycole, Mrs. Beck, Duke of Perth, Climax, and others, already arrest the attention of all who visit my little garden. Those who have never tried to cultivate the Pansy in this way have little idea what a profusion of really gay flowers is produced by this plant during the whole of the early months ; and with proper attention they will blossom in good character till the latter part of May. As regards cultivation, little need be said ; for the Pansy is not difficult to manage. Plants for early flowering should be potted up from the open ground in October. If the weather is open in the last week in January, or the first week in February, begin to repot generally, using soil consisting of good decomposed turfy loam, rotten manure, a little leaf-mould, and coarse sand, the latter in proportion to the nature of the loam. The soil should not be pressed hard with the hand ; no water should be given for a day or two after potting. Before, as well as after this operation, the plants must be kept well up to the glass. They should have from two to six shoots, or strong leaders ; and to keep them to these chosen shoots, a number of small ones must from time to time be removed. These cuttings answer the double purpose of strengthening the main shoots, and producing a stock of young plants, which will supply the place of the old ones when worn out. Keep the frames in which they are placed open whenever the weather is favourable, pulling the lights back, or tilting them up ; maintain the plants in a growing state by watering them as often as they require it, going over them for this purpose every day. Plants that have several shoots should be tied into shape, placing the centre-branch upright in the middle, and the remainder at equal distances all round ; but the plant must be shaped according to the number of shoots : three leading branches are sufficient if cut blooms only are required. Another advantage is, that the same plants, from the succession of bloom they produce, will answer the double purpose of exhibiting in pots or stands of cut flowers. After the potting, as above recommended, has taken place, takes the earliest opportunity at which the ground is in a fit state, to plant out any stock not required to bloom under glass, or plants that have been wintered in stores, &c., which will bloom through May or June, and produce a stock of good healthy cuttings. By following the simple and inexpensive treatment just recommended, I am sure that those who take the little trouble that it entails will not fail to be gratified by a fine display of bloom, which, from its long continuance, will most certainly afford much gratification. *E. B.*

THE AURICULA.—About the middle of this month, if the weather continue as fine as it is at present, the trusses will be sufficiently forward to select those intended for exhibition. Seven pips are the lowest number allowed by our metropolitan societies ; therefore select the most promising, containing that number and upwards. Those with round buds, as nearly of a size as possible, the truss also round and compact, should be particularly selected, and if there are any monster pips among them with large oblong tubes or other deformities, remove them while young. At this stage of their growth, care must be taken in watering that none be allowed to fall into the tubes or pipe, if it happen to be exposed, as is the case with some varieties ; for although the buds be so young, the meal of the eye may be formed, and if so the water will run the meal over the ground-colour, and when the blossom is expanded it will be found dull and unfit for exhibition. The meally-grass varieties require a little extra attention, for their beauty is much increased by preserving

he white powder on their foliage. To obtain this object without drawing the plants more than possible, I nail a strip of wood on each side the centre bar of the frame, of sufficient width to shelter them from rain, and place the plants beneath it. By this means they enjoy a free circulation of air and light till in a proper state of forwardness to remove under the hand-glasses, or on the stage. *L.*

Polyanthuses in Pots.—The Polyanthus under pot-culture does best in a western aspect from the present time to the end of its blooming. Give as much air as possible during the day, unless strong cold winds are blowing; then keep the lights on. If the frame is in a western aspect, give air at back, by lifting the lights about three inches; but if in a southern one, lift the lights at the front. Protect them at night: a mat or two thrown over the frame will be advisable. Top-dress as early as in the month as you can, if the atmosphere is not frosty. Polyanthuses thrive best in a cool soil, rather strong in quality than otherwise. One measure of decomposed cow-manure, two of leaf-mould, and two of strong loam (top spit), are suitable for them; but for top-dressing only, the compost given for the Auricula will answer. Water them moderately, increasing the quantity as the plants increase in growth; and allow them to receive light showers during the month when the weather is open. *B. W.*

Tulips: *S.* We fear the severe frost has affected Tulips, for several collections which we have seen, appear above ground with the foliage considerably cankered. In these cases the soil should be removed from the affected part, which should be carefully cut away with a sharp knife, and some coarse river sand placed round that which is sound.

Carnation Compost: *E.* Pass it carefully through the hands before you use it, in order that no wireworms may escape detection.

Miscellaneous.

Sale of Timber, Wimbledon.—Last week an auction was held at Wandsworth, by Messrs. Chinnock and Galsworthy, of timber, underwood, &c., growing upon the Wimbledon Park Estate, which called together a large attendance of timber-merchants and dealers. The sale comprised 130 lots. The prices realised were higher than those of former sales, owing to the great demand for timber for ship-building purposes. The small class Oak, for which there was the greatest demand, realised 3*s.* 4*d.* per foot; the largest Wych Elm, 2*s.* 4*d.*, being the price of Oak of former sales; and the best quality Lime as much as 1*s.* 10*d.* per foot. The total result of the day's sale was nearly 2200*l.*

Wages at Sydney.—The following, from a Sydney paper, the *Empire*, shows the rate of wages there in November last:—Stonemasons, last week 22*s.*, this week, 25*s.* per day; plasterers, 21*s.* per day; bricklayers, 20*s.* per day; quarry labourers, 10*s.* to 15*s.* per day; bricklayers' labourers, 14*s.* to 16*s.* per day; plasterers' labourers, 12*s.* per day; other labourers, 10*s.* per day; carters, 10*s.* per day. *Builder.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

Conservatory, &c.—Orange trees in tubs or pots should be carefully examined, in order to ascertain whether or not their roots are in a healthy state, and those requiring more space should be shifted at once; but, in many instances, it may not be possible to afford large spec mens a shift. In this case remove as much of the surface soil as can be done without greatly injuring the roots, and replace it with a mixture of good loamy turf, broken bones, decayed cow-dung, and sand, and see that the balls of the plants are in a moist healthy condition. Strong manure water is of great service to these, and may be applied freely at all seasons, particularly now, when the trees will be starting into growth. It is quite impossible to use the syringe to advantage in many conservatories, and under such circumstances the flowering plants should be removed to one end of the house, and the twiners, &c., given a liberal washing with the engine, which will also greatly assist in keeping the glass, &c., clean. This should be done before the twiners start into growth, as there will be no danger of injuring the tender foliage while they are in a dormant state. Be satisfied with a rather low temperature for the present, and give air freely on fine days, endeavouring to avoid cold, drying currents, as much as possible. Attend to keeping up a supply of Roses, Azaleas, and other things requiring to be brought forward in a gentle heat, and persevere in the destruction of insects. Stove.—Plants in active growth will require much attention, in order to properly direct their energies, and keep them perfectly clear of insects, &c. Give a little weak manure water to such things as Allamandas, Clerodendrons, &c., if in free growth; and multitudes of stove plants will be benefited by the same treatment. Do not neglect the old, but beautiful and useful Lisianthus. Keep the plants growing as freely as a moist, high temperature, plenty of pot-room, manure water, a rich open compost, and all the light possible, will effect, and get in seed at once, so as to insure a supply of plants for next season. Keep up a free circulation of air on any favourable opportunity, in order to induce a sturdy habit of growth. Water freely, but cautiously, especially in the case of recently potted specimens.

FORCING DEPARTMENT.

Pinery.—Succession plants should not be allowed to get too dry at the root at this season, as this would probably throw them prematurely into fruit. In repotting these, if a plant is found too dry, it should be set aside and well watered, so as to get the soil into a moist healthy state before shifting. And where the plants are growing in the open bed the soil should be carefully examined to a sufficient depth, and if it is found to be over dry, water as often as may be necessary, with tepid water, to thoroughly moisten the mass, allowing two or three days between each application. Maintain a moist atmosphere, and shut up early in the afternoon, allowing the glass to rise to 80°, but do not exceed 60° at night. Vineries.—Proceed with thinning the berries wherever the crop is sufficiently advanced to allow of this being down. Stop laterals, tie in young shoots, &c, and keep everything neat and orderly. Maintain a steady night temperature as near 65° as possible; give air freely on fine days, taking care to open all the ventilators a little, and endeavour to avoid cold currents. See that the buds in the late house are not excited by the present bright weather; keep the house cool. Watch narrowly for red spider in the early Vinery, and in the forcing houses generally, and should it be detected anywhere, lose no time in washing the infested leaves and those around them, using a soft sponge, and clean water with a little soap. This may appear a tedious process, but if the enemy is taken in time it will be more easily eradicated by these means than any other. Figs.—Keep the shoot thin, so as to expose the foliage to light and air, and persevere in the use of the syringe to prevent red spider. Give air freely on bright days, shutting early in the afternoon after syringing the house. Peaches.—Proceed gradually with the disbudding of the early house, and where the fruit is very thick a portion of these should be removed as soon as they are fairly; set but the Peach is liable to drop until after stoning, and this must be borne in mind, and plenty left to allow of a few falling. Maintain a steady heat to Cucumbers of 65° or 70° at night, and allow it to rise 10° or 15° with sun heat. Give air on every possible opportunity, but be very careful of cold draughts, which would ruin the tender foliage. Stop the Vines, and keep them thin and regularly disposed over the trellis, so as to expose them to light and air. Attend carefully to the early Melon plants, and regulate the temperature according to the amount of sunshine, taking care not to get the Vines weak and long jointed, through a high close temperature; for if this state is induced, it will be difficult to secure either an early or abundant crop. Do not omit putting in seeds of some of the finer kinds for succession crops. The Bromham Hall is an excellent variety, probably not surpassed as a hardy, fruitful, high flavoured kind.

FLOWER GARDEN AND SHRUBBERIES.

Finish removing shrubs where not already done as soon as possible, and lose no time in getting alterations involving the relaying or putting down of fresh turf completed, for it is a great saving of after attention and labour to get this kind of work finished before the drying winds set in. If not previously done, get pillar Roses trimmed and tied, and where wood stakes are used examine these carefully, and let none be left that are not likely to last the season, for they are not conveniently replaced after the plants begin to ramble about. It is an excellent practice to give pillar Roses a liberal dressing with strong manure water; or, where it can be obtained, night-soil mixed with water, so as to reduce it to the consistence of thick paint. The surface soil should be removed for about 18 inches or 2 feet from the stem of the plant, and placed so as to form a basin, then apply 4 to 8 gallons, according to the strength of the plant, and replace the soil. This will be of great service towards inducing strong vigorous growth, and a fine display of late flowers, in the case of the autumn blooming sorts.

HARDY FRUIT DEPARTMENT & KITCHEN GARDEN.

Get the pruning and nailing of all fruit trees finished with the least possible delay; and if any planting still remains to be done, this should be completed without any unnecessary loss of time. It may appear like an attempt to act the part of an antiquarian to refer to the old, and I hope now universally condemned practice of digging a deep pit, of about the same compass as the roots of the tree to be planted, and filling it with the richest compost which could be produced. I believe that I have assisted to put as much as a good cart-load of rotten dung under a Peach tree, but I am not sure that a modified form of this is not still practised, by way of securing a vigorous start. It is a great mistake, however, to induce the production of gross, long-jointed wood, in any stage of the existence of a fruit tree, for wood of this character is never properly ripened, and in the case of stone fruits, gum, canker, and the premature loss of the tree is the result, and in the case of Pears and Apples, anything deserving the name of a crop of fruit is never obtained until the gross habit induced by planting in over rich soils is overcome. Ground intended for fruit trees should first be drained; and this should be efficiently done, regardless of expense, and then trenched to the depth of two feet. And if the natural soil is found to be too poor for the health and growth of the trees, a sufficient quantity of fresh turfy loam should be added, but rich stimulating manures should not be used, for they are soon exhausted, and the trees are left to depend upon the natural soil for their support, and when treated in this way never give satisfaction. Trees infested with moss or lichen should have their stems, &c., scraped, and be painted with a composition of lime, soot, and cow-dung, mixed with soapsuds to the consistence of thick paint, carefully working the mixture into the crevices of the bark, in order to bury American blight, or other insects which may be lurking there. Take advantage of the first fine day, with the ground in working order, to get in the main crop of Onions. The old practice of sowing broadcast must be given up as being too expensive to clean and thin the crop. Select a piece of deep land in good condition, and if the surface is not naturally firm, render it so before sowing by treading, or rolling.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending March 2, 1854, as observed at the Horticultural Gardens.

Feb. 24—Fine; cloudy throughout.
— 25—Clear; fine with bright sun; clear; frosty.
— 26—Clear and fine throughout; frosty.
— 27—Uniformly overcast; clear and fine; partially overcast.
— 28—Fine throughout; clear; sharp frost at night.
March 1—Frosty; very fine, clear and frosty.
— 2—Frosty; very fine; hazy at night; sharp frost.
Mean temperature of the week, 3 deg. below the average.

RECORD OF THE WEATHER AT CHISWICK,
During the last 28 years, for the ensuing week, ending March 11, 1854.

March.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sunday 5	48.1	31.9	40.0	9	0.40 in.	2	6	3	1	4	7	4	2
Mon. 6	48.0	32.6	40.3	10	0.26	1	7	2	1	2	5	4	6
Tues. 7	49.2	32.4	40.8	11	0.11	3	5	3	1	4	7	3	2
Wed. 8	49.7	32.6	41.1	10	0.17	3	6	3	1	5	4	2	5
Thurs. 9	50.5	32.2	41.4	8	0.47	2	4	2	2	4	7	3	4
Friday 10	50.6	32.1	41.4	11	0.69	3	4	1	2	3	6	3	5
Satur. 11	50.2	33.1	41.6	9	0.20	1	4	2	5	3	9	2	2

The highest temperature during the above period occurred on the 9th, 1836—therm. 68 deg.; and the lowest on the 10th, 1847—therm. 7 deg.

Notices to Correspondents.

Back Numbers. Full price will be given for the following Numbers:—1845, No. 24; 1848, No. 46.

Celery Seed: *W Luff.* No. 1 is bad and unripe; No. 2 is what it should be. But why continue to deal with those who treat you ill? Remember, however, that the last was a very bad season for ripening seeds, and that your seedsman cannot sell you what the season would not produce.

Colours of Flowers: *W H B.* You will find full information on the grouping and management of colours in former volumes, more especially in that for 1850, pp. 4, 36, 116, 165, and 181. ‡

Cut Flowers: *Thursday.* Place them in a vessel of water; put the vessel in a dish containing a little water, and cover the whole with a bell-glass.

Cypresses: *Devoniensis.* That must be, indeed, a favoured climate in this country which will enable the common upright Cypress to succeed as an avenue plant. It is much too tender, and demands a roasting summer. Nor is its stature large enough, even if it manages to grow. The Cupressus macrocarpa would indeed succeed; for that plant is hardy and forms a great tree. We are not at all surprised at your common Cypresses having perished during the present winter.

Fall of Rain: *Old Sub.* We are unable to furnish the information you seek. Will the register kept at Chiswick, and given every week in our columns, not answer your purpose?‡

Fences: *Rainhill.* Robinia ferox fit for fencing! Yes, if you can make it grow, and are willing to pay for a hobby—about 20 times as much as it is worth.

Hartley's Rough Plate: *P with S.* The opinion you have heard expressed is not only unfounded but ridiculous. The formation of foci is precisely what this kind of glass renders impossible.

Heating: *Dido.* You will never succeed in getting a good circulation with descending pipes, even if you succeed in getting a circulation at all. No doubt the siphon principle may be applied, but it will not continue to answer. You *must* alter your house. Can you make water flow up hill?

Insects: *W G.* Your scale is the Coccus Persicæ; it is not common; it is also occasionally found on the Apricots. Warm water (to 145°), or brushing the trees over with an oily matter of any kind, will destroy them; but these remedies, or even careful examination and removal of the insects by hand, ought to be at once adopted, or the young will soon escape from the eggs now lying beneath the scale. *W.*

Ivy: *McArthur.* We are unable to assist you; but doubtless the golden blotched Ivy can be obtained through the trade, if you make it worth while to inquire for it. We believe it is not often kept, because it is no favourite, and is seldom wanted.

Larch: *A M.* It is considered by the most skilful foresters that, as a general rule, Larches should be left at about one-third of their height apart. They should be gradually thinned as their increasing height demands it.

Names of Plants. We have been so often obliged reluctantly to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*H H.* Your Baccella violacea is the beautiful Phytolacca icosandra, a not uncommon plant.—*Sancho.* Lavandula multifida. Rindera lævigata is probably not in in this country. If procurable, it will be from some botanic garden in the north-east of Europe.—*J M.* Juniperus recurva.

Pinus Laricio: *W H. and another Correspondent* shall be answered next week. Wood of Pinus Laricio will be produced at the meeting of the Horticultural Society next Tuesday.

Potatoes: *Amateur Gardener.* Soaking Potatoes before planting them in salt and water is no preventive of disease whatever; rather the reverse.

Ragged Robin: *Sub.* This is Lychnis Flos Cuculi—a weed. You doubtless mean the now much neglected variegated Kale, sometimes called Ragged Jack. Its treatment need not be different from that of other Kale, except that if you wish to keep it true it must be perpetuated by means of sprouts or cuttings of its stem.‡

Type for Stamping Lead: *B Andworth.* Apply to the first ironmonger who has a decent trade.

Willows: *W.* How many species? A hundred, fifty, twenty, a dozen, half-a-dozen. All depends upon what you mean by species. The males and females are not distinguishable in foliage. Mules among them swarm.

Worms: *R E X.* They may be effectually got rid of by watering once or twice with lime-water, which will not injure your roots or bulbs.‡

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

PERUVIAN GUANO, the guaranteed import of Messrs. ANTONY GIBBS AND SONS, Lobos Island Guano, Superphosphate of Lime, and all Artificial Manures, Linseed and Rape Cakes, &c.—WM. INGLIS CARNE, 10, Mark Lane, London.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analysis and Assaying, will find ample facility and accommodation at the College.

PEAT MOSS CHARCOAL, AND OTHER MANURES.—The Undersigned are appointed sole Agents by the Peat Moss Charcoal Company, for the sale of this valuable fixer and distributor of ammoniacal matter.
Also on Sale, Peruvian Guano, Superphosphate of Lime, Gypsum, Nitrate of Soda, Bone-Dust, Sulphuric Acid, and all other Manures of known value.—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

SUPERPHOSPHATE OF LIME MANUFACTURED BY MR. J. C. NESBIT'S IMPROVED STEAM MACHINE. The following is the analysis of an average sample.
"College of Chemistry, Agriculture, and General Science, 38 & 39, Lower Kennington Lane, London.
Analysis of Sample of Superphosphate of Lime from Mr. Jolliffe:

Moisture		13.97
Organic Matter, &c.		21.98
Silica		6.05
Phosphate of Lime		35.27
Soluble	16.10	
Insoluble	19.17	
Sulphate of Lime, &c.		22.73
		100.00
Nitrogen (equal to)		1.16
Ammonia		1.41

(Signed) J. C. NESBIT."
Delivered free at a Wharf or Railway Station in London at 3l. per ton.—Apply to E. Y. JOLLIFFE, 70, Mark Lane, or the Works, Lavender Dock Wharf, Rotherhithe.
Agents wanted in all the principal towns.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS. MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

TO LANDOWNERS, SOLICITORS, ESTATE AGENTS, ETC. THE LANDS IMPROVEMENT COMPANY, incorporated by special Act of Parliament, 1853, having perfected their organisation, are prepared to receive applications for the execution of improvements, under the provisions of their Act.
The Act extends to England, Wales, and Scotland; and empowers persons in the actual possession of lands, or in receipt of the rents, such as tenants for life, trustees, bodies corporate, incumbents of benefices, mortgagees in possession, guardians of infants, &c., to effect substantial improvements on their estates, and to convert the outlay on such improvements into a terminable annuity or rent-charge of from 14 to 25 years, at will.
The Company, acting under the supervision of the Inclosure Commissioners, will undertake and execute improvements, or will supply the capital to landowners preferring to execute improvements themselves, or will grant the powers of their Act to landowners seeking merely to charge the inheritance with the outlay on improvements from their own funds.
The Agricultural Works of Improvement particularly specified in the Company's Act, are:—
1. The Drainage of any Lands by any such means as the Inclosure Commissioners shall approve.
2. Irrigation, and Warping of Lands.
3. Embanking of Land from the Sea, or Tidal Waters, or Rivers, in a permanent manner.
4. Enclosing or Improving the Drains, Streams, or Watercourses of the Land, under the Inclosure Commissioners.
5. Reclamation of Land lying waste.
6. Making Farm-roads to the extent of one-half of the outlay for such roads.
7. Clearing Lands.
8. Erection of Farm-houses, and other Buildings required for farm purposes to the extent of three-fourths of the outlay for such Farm-houses and other Buildings.
In effecting the above Improvements there may be erected any Engines, Machinery, Engine-houses, Mills, Kilns, Sheds, Yards, Shafts, Tanks, and Reservoirs, Pipes, Conduits, and Watercourses for Irrigation, Tram-roads and other ways, Bridges, Weirs, Sluices, Flood-gates, and Hatches.
For Forms of Application and further Information apply to the Hon. W. NAPIER, Managing Director, 2, Old Palace Yard, Westminster, London.

ESTABLISHED ABOUT HALF A CENTURY.

AGRICULTURAL SEEDS,

OF THE FINEST SELECTED STOCKS, OFFERED BY

BASS AND BROWN,

SEED GROWERS AND MERCHANTS, SUDBURY, SUFFOLK.

HAVING been established about half a century, which has secured to us an extensive knowledge of the best growers in this important Agricultural Neighbourhood, and being situated in the vicinity of a large Seed growing district, we are enabled to offer our Seeds with confidence, being either of our own growth, or selected from the most approved growers with the strictest care, and our prices will be found as low as the markets and quality of the stock will admit.
SUDBURY AGRICULTURAL ASSOCIATION.—In the report of the Exhibition of Oct. 21st, the following remarks appeared in the *Essex Standard* of the following week:—
"On the opposite side of the Exchange Messrs. BASS & BROWN had a capital stand of Agricultural Roots, comprising 20 samples of Long and Globe Mangold Wurzel; 17 of White and Swede Turnips; and 17 of Belgian Carrots. A label upon them modestly explained that they 'were not shown as specimens of extraordinary growth, but as samples of the stock from which the seed of last season was sold,' it being the practice of the firm to reserve a portion of each bulk of seed purchased, for sowing on their own ground, by way of testing its purity of stock, and as a reference in case of complaints by customers. Although not pretending to gigantic size, the roots needed no apology on the score of growth, being all of full average weight, and remarkably clear and short to the cut or bite."
In the *Essex Standard* of Nov. 11th the following remarks also appear:—
"At Sudbury market, on the 3d inst., some very fine specimens of Yellow Globe Mangold Wurzel, Red Tankard, White Globe, White Round, and Green Round Turnips, were exhibited on the stand of Messrs. Bass and Brown, grown by S. Viall, Esq., of Foxearth, from seed purchased of that firm. So fine were they that several farmers remarked that Mr. Viall must have grown them on a dunghill."

	Per lb.—s.	d.
MANGOLD WURZEL—Long Red	1	0
" " Long Yellow	1	0
" " Yellow Globe	1	0
" " Red Globe	1	0
" " White Silesian, or Sugar Beet	0	9
CARROT—Green Top White Belgian	1	8
" Large Yellow Belgian, or New Intermediate	2	0
" Long Red Altringham	1	0

New American Strapleaf Stone	2 0
Cabbage—Fine large Drumhead	2 6
Lucerne	1 0
Alsike Clover	2
Bokhara Clover	2 6
White, Red, and Cow-grass Clover	0 10
Prices per cwt., on application.	
Giant Saintfoin Per bush.	12s. 0d
Linseed, fine sowing quality	10 0

For various other Seeds, see Catalogue.
The above prices may vary with the markets.
☞ For large quantities of Mangold Wurzel, Carrot, &c., prices furnished on application.

GRASSES.

We have for a number of years bestowed considerable attention and care in the selection of Grass Seeds for Permanent Pasture, and have annually supplied large quantities, which have given the highest satisfaction. These Grasses are assorted and mixed of proportionate quantities proper for the various descriptions of soils, and consist of sorts grown in different localities and gathered separately, thereby rendering them entirely free from obnoxious weeds. Persons ordering seeds should state the nature of the soil required to be sown, and if with or without a corn crop. The quantity we usually supply per acre is 3 bushels of Light Grasses, and 9 lbs. of Clovers and Heavy Grasses, comprising varieties of Poas, Fescues, Meadow Foxtail, Sweet Vernal, and other nutritious and useful kinds, but the quantity per acre is varied for soils of peculiar character. We give a scale of charges for the various purposes stated as under:—

PERMANENT PASTURE, MEADOW, AND LAWN GRASSES.

PRINTED INSTRUCTIONS FOR LAYING DOWN WILL BE SENT WITH THE SEEDS.

	Per acre—s.	d.
Mixtures for Permanent Pasture on Light Lands	24	0
Mixtures for ditto on Heavy Lands	27	0
Mixtures for Parks, or Permanent Lawn Pasture	28s. to 32	0
Mixtures for Fine Lawns, Bowling Greens, &c.	34s. to 38	0
Mixtures for Orchards, &c., much overshaded by trees	24s. to 30	0

	Per acre—s.	d.
Mixtures for Marshy Grounds, or Meadows subject to flood	24s. to 28	0
Mixtures for Renovating Old Pastures	10d. per lb.	
Finest Lawn Mixtures for Flower Gardens, &c.,	1s. per lb., or 4s. 6d. per peck.	

For prices of the various species of Grasses separately, see our General Spring Catalogue.

RYE-GRASSES.

TRUE ITALIAN, fine	Per bushel	5s. 6d.	
PERENNIAL RYE-GRASS, per bushel	4s. 6d. to	5s. 6d.	
FINE IMPORTED	Per bushel	6s. 6d.	
FINE PACEY'S RYE-GRASS	"	5s. d.	

The New Agricultural Grey Pea, "Bishop's Last and Best."
This Pea is remarkably early; grows 2 ft. high, of most robust growth, branching, produce large; as much as 7 qrs. per acre has been got where only 6 pecks of seed was sown. The seed weighs heavy, 64 lbs. per bushel being the general average. Price 12s. per bushel.
Prices of Agricultural and other Seeds to the Trade on application.
GOODS (not under 20s.) FREE to all the Stations in London.
BASS AND BROWN, SEED ESTABLISHMENT, SUDBURY, SUFFOLK.

RENDLE'S NEW FARMING PRICE CURRENT AND AGRICULTURAL DIRECTORY FOR 1854.
OPINION OF THE EDITOR OF THE "MARK LANE EXPRESS:"—
"We have just seen a copy of this excellent Price Current, and consider it a most valuable companion to the Agriculturist. It is the same size as the garden edition, lately reviewed in this paper. It contains an excellent Almanack, with the University Terms, Eclipses, &c., and a List of Fairs and great Markets held in the four Western Counties. The descriptive lists of Grasses are excellent; they give all the best varieties for permanent pasture, ornamental parks and lawns, sheep walks, heathy and moory lands, &c. Then comes the list of Clover and Turnips, all described in a concise and useful manner. Then follows descriptions of the best Mangold Wurzel, Carrots, and other vegetables used in agriculture; then we have a Price Current of all the best Natural and Artificial Manures, with much useful information relative to Peruvian Guano, Lawes' Patent Superphosphate, Nitrate of Soda, Bone Dust, Bolivian Guano, &c.; then are found some very good advice relative to the purchase of so-called Wheat Manures; but the best Paper is one contributed by J. B. Lawes, Esq., of Rothamsted, 'On the Cultivation of one Green Crop after another on Heavy Land.' This should be read by all engaged in agricultural pursuits. There are some valuable tests for discovering adulterations in manures, by J. C. Nesbit, Esq., the celebrated agricultural chemist; and the report of a lecture by Professor Way on the same subject; then follow the Advertisements, comprising some illustrations of the best implements of the day. It is very well got up, and comprises 52 closely-printed pages, crown quarto size, and we strongly recommend it for the perusal of all engaged in the healthy pursuit of agriculture."

THE BIRMINGHAM CATTLE SHOW.—POSTPONEMENT OF THE PROPOSED SHOW OF STORE STOCK AND AGRICULTURAL IMPLEMENTS.—At a Meeting of the General Purposes Committee of the Council, held on Thursday, February 23d, the subjoined Resolution was unanimously adopted:—
"That, as from unavoidable circumstances, the plans for holding the Show of Store Stock and Agricultural Implements in June next cannot be sufficiently matured, it is resolved that the Show be postponed until 1855; and that the proper notice be given to the Public without delay."
(By order.) JOHN MORGAN, Jun., Secretary.
Offices, 38, Bennett's Hill, Birmingham, March 4.

THE BIRMINGHAM CATTLE AND POULTRY SHOW, 1854.—The Sixth Great Annual Exhibition of Stock and Domestic Poultry will be held in Bingley Hall, on the 12th, 13th, 14th, and 15th of December next. The Prize Lists, and any further information, may be obtained from
JOHN MORGAN, Jun., Secretary.
Offices, 38, Bennett's Hill, Birmingham.

PRICES AT MARK LANE.

IN ACCORDANCE with the wishes of Farmers, Millers, and others interested in the Corn Trade, an Edition of the AGRICULTURAL GAZETTE AND GARDENERS' CHRONICLE will be published every Monday Afternoon, in time for post. The Monday's Edition will, in addition to the usual markets, contain a full report of the Mark Lane, Smithfield, and Newgate Markets of the day.—May be ordered of any News Agent. Price 6d.

The Agricultural Gazette.
SATURDAY, MARCH 4, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS

MONDAY,	March 6	Central Farmers' Club.
WEDNESDAY,	— 8	Agricultural Society of England.
THURSDAY,	— 9	Agricultural Imp. Society of Ireland.
WEDNESDAY,	— 15	Agricultural Society of England.
THURSDAY,	— 16	Agricultural Imp. Society of Ireland.

THE memorial on the commercial aspect of the question of AGRICULTURAL STATISTICS, which we referred to at p. 74, was last Saturday presented to Lord ABERDEEN by a deputation from the merchants of London. It is believed to be one of the most influential in regard to signatures which has ever emanated from the City of London. Mr. MASTERMAN, in presenting it, stated the great importance of its object to the commercial interests of the country. He trusted that his lordship and the Government would be enabled to effect such arrangements as would secure the object sought by the memorialists—the collection of accurate returns of the agricultural produce of the country.
Lord ABERDEEN briefly explained what had been done by Government to effect the object sought by the deputation. He said it was desirable to avoid measures which might appear compulsory, but he was happy to say that now there is every prospect of the experiment being attended with perfect success. Enough had been done to prove that a

system may be extended generally throughout the country, though he was not prepared to say by what machinery. The importance of the object is fully admitted, and its practicability proved. The time and the mode of inquiry are, therefore, now the only points to be determined.

We are, therefore, at length likely to obtain what has been long felt by all intelligent men, both in the agricultural and in the commercial world, of the greatest importance, not only to the business and to the art of farming, but to the commercial well-being of the country. The immediate publication of the main facts regarding the produce of the country will benefit no one more than the producers; and we hope that this aspect of the subject, which is to be discussed before the Central Farmers' Club next Monday, will be plainly brought out, for the information and guidance of farmers' clubs throughout the country. That even the more general and less immediate results of such an inquiry are of agricultural value is evident from the useful lessons derived from our Irish agricultural statistics, which being published a year after collection, and therefore not made known till the food to which they relate is consumed, can be of no commercial value whatever.

We have received several letters on the subject of Turnip Graters and Pulping Machines. One of them is published in another page, and to another we shall refer in this place.

The first attempt to produce such a machine was made by Mr. Moody, of Wiltshire, who exhibited his implement, we think, at the Oxford meeting of the English Agricultural Society. It consisted essentially of a metallic conical hopper for the roots, in which there slowly revolved, driven by horse-power, a vertical radial valve or piston, curved in such a form that in carrying the roots round with it they were pressed and scraped along the inner surface of the cone. This inner surface presented edges by which the roots were squeezed and scraped, and cut through the hopper, and fell into a receptacle below. The idea was that the pressure and the mode of cutting or grating together would result in the formation of a pulp; but our correspondent, at p. 107, tells us that its performance results merely in the reduction of the root to ribands and thin slices. Mr. Carson, the present maker of these machines, assures us that another machine of Mr. Moody's invention exists by which Turnips really are *pulped;* and a correspondent, "Inventor," informs us that he has perfected a machine, not a riband cutter, but a perfect grater, which he is to exhibit at Lincoln. He has sent us a sample of its performance, in which, though not pulped, the substance of the root was so far reduced, that the whole arrived in an offensive state, owing to the rapid fermentation which had ensued. "Inventor" states the reason of his attention to this subject, and as we believe that he takes the right view of it, we make the following extract from his letter:—

"Like your correspondent 'An Advocate for Pulp,' I had been looking and inquiring a long time in vain for a machine that would reduce Turnips and other roots to such a state of comminution as that they might be so intimately mixed with meal, bran, or chaff, that the animals feeding on them could not select them from the meal, &c., with which they were mixed. As I am a cultivator of two very large farms, and knew how valuable such a machine would be, as I could not otherwise supply my urgent want, I set to work to invent, and make such an one myself."

This is, we believe, the principal service to the farmer which comminution and reduction of food performs. There is, to a certain extent, an advantage common to all animals derived from saving a portion of the labour of mastication, and as this is sometimes, especially by horses, imperfectly performed, there is, in the case of animals which do not chew the cud, the advantage of this artificial performance of a necessary process, which would otherwise in a measure be neglected; but for sheep and cattle this is probably a less important aspect of the subject, and for them the main use of chaff cutters and root graters, &c., is to enable the perfect commixture of different sorts of food, so that the less savoury portions may be consumed along with what is mixed with them.

In the case of Messrs. Bushe and Baxter's root-grater, which has excited a great deal of attention in Ireland, but which our correspondent "An Advocate for Pulp" tells us does no more than previous implements for cutting Turnips into ribands—the great advantage derived from its use is said to depend upon the fermentation which is set up in roots so treated.

The fermentation set up in meal and other vegetable substances stored away for pigs is an acid fermentation, and, as far as our experience goes, is of no use whatever in increasing the nutritiveness of food. Even the saccharine fermentation, as undergone in the malting of Barley, is a process of doubtful expediency, and our belief is that even here the waste of substance incurred in the fermentative process more than balances any advantage derived from the greater solubility, or the better taste of the food so treated. The process of fermentation too in such watery material as pulped Turnips rapidly becomes offensive, so that to avoid all risk we believe that, as with ordinary cut Turnips, so with those more thoroughly reduced, the best plan is to use them as soon as possible after their reduction, taking advantage of their pulped condition to mix them with chaffed hay or straw, with meal, &c., in any way that is desired, and so ensuring that all the food grown on the farm shall be consumed, about which there would otherwise be difficulty, if not impossibility.

We must not forget, however, that no strictly *pulping* machine has yet appeared. And we believe that the process, when it shall be effected, will require such an expenditure of power as to render it inapplicable in ordinary farm practice. These graters or riband cutters do, however, so far reduce the substance of the root as to enable its very perfect mixture with the other kinds of food, which it is desired to consume, and so far serve a useful purpose.

NOTES ON EXPERIMENTS
IN THE BOTANICAL GARDEN OF THE ROYAL AGRICULTURAL COLLEGE.—No. II.

By Professor J. Buckman, F.G.S., F.L.S.

Among the list of agricultural leguminosæ, there is none of greater interest for hay or green crops than the Trifolium; at the same time, considering the number of native species and the exotic forms which might easily be introduced, it is surprising how few are met with in common cultivation.

My experiments were conducted with six kinds, namely, Trifolium pratense, red Clover (two varieties); T. hybridum, Alsike Clover; T. repens, Dutch Clover; T. filiforme, Suckling Clover; and T. incarnatum, Honeysuckle Clover. The T. pratense (variety one) was evidently a cultivated form of the red Clover, which appears to be native in most good pastures, and more especially in lowland districts, in which, however, it never attains the size of the sown plant—its leaflets are broad with a semilunar white spot to each, the heads of flowers dense, their base resting in the expanded stipules of the upper pair of opposite leaves. The other form is distinguished by the name of T. pratense perenne, and, as far as I can at present make out, is larger in its growth than the former; the head of flowers is slightly stalked, and the lower part of the stems hollow. This sometimes receives the common name of Cow-grass. Now, my object in being thus particular in describing these two plants is to point out the confusion in which this matter seems at present involved, inasmuch as in agricultural works we find the T. medium, zigzag Trefoil, as the Cow-grass, and there is no doubt that it is a valuable species, as being capable of yielding a much larger crop on light soils; this can be distinguished from the O. pratense by its narrower, longer, and more pointed leaflets, in which the white spot is absent, and a more lax stipitate head of darker reddish purple flowers.

From these remarks it would appear that there are at least two forms of Clover in the market which have got the name of Cow-grass, though I must confess that the true form, namely the T. medium, is seldom met with in cultivation in this part; and as two varieties of T. pratense are distinguished as broad Clover and Cow-grass, it is no wonder that farmers hereabouts should constantly find it difficult to distinguish them; indeed this is a subject in great confusion, and from the samples which have from time to time been sent to me as the one or the other, I freely confess it will require another season of observations to enable me fully to make out the true market Cow-grass.

The T. hybridum succeeded admirably in our plot, and as the soil has been described as of very inferior quality, I am induced to recommend a further trial. It has an upright method of growth, is of a truly herbaceous habit, with abundant leafage, and is good either for green food or hay. I shall this year try its behaviour in mixed "seeds." I am informed that it is a general plant in Belgium, and, if on a larger scale it does as well as its promise in my small experiment, it may become a valuable addition to our Clover list; and in this matter we should be disposed to welcome all good new comers, as experience shows that older kinds lose much of their good characteristics by constant repetition.

The Trifolium repens keeps the best hold of the soil; its scions spread year after year, lusty and strong as the parents. Could a variety of this plant be obtained that would yield a larger quantity, it would be invaluable; as it is, on our light thin soils, it is of great use for seed mixtures, as it fills up the bottom with a green delicious herbage, which would often in seasons of drought become dry and cracked, and the Rye-grasses resolve themselves into mere calms or, as our farmers term them, bents.

The T. filiforme is of very little importance, its habit of growth is so small as to render it not worth cultivating as a self crop, nor is it of service even in mixtures; however, it increases instead of diminishing in my plot, now three years old.

The T. incarnatum is an introduced annual Clover, and certainly yields a large crop in very poor soils; our patch was sown in 1852, since when it has not been resown; but year after year it comes up well from seeds, and with but little change.

I know little of its feeding properties, but I am inclined to think, from its appearance and mode of growth, that it is worth trying as an occasional crop, as it wants but little preparation, and seems to get on anything but badly in very poor soil.

The group of Leguminosæ next in importance to the Trefoils as fodder, is perhaps the Vetches. Of these, my plots contained four forms, namely, Vicia angustifolia, narrow leaved Vetch; V. sativa, common Vetch; V. sepium, bush Vetch; and V. cracca, cow Vetch.

The first of these, V. angustifolia, was planted with seed collected by myself in Earl Bathurst's Park; and as I was much interested in its cultivation, I was very careful in the choice of the seed, and in observing the result. It was drilled in rows about 15 inches apart, and came up very regularly and flourished well; however, when in flower, there was a marked difference in some of the plants, inasmuch as they were more robust and presented broader leaves than the others; and as they progressed to seeding, the difference became still more apparent, as the larger examples bore broader pods, which contained larger seeds than those presented by the more delicate plants of the typical V. angustifolia. In fact, there was no getting rid of the conclusion that from the same seed was obtained in one year two types of a plant which have been referred, when growing in wild nature, to two distinct species; and as this is no less interesting as an agricultural than a botanical subject, I shall give, in brief, in opposite columns the characteristics of the two forms.

V. angustifolia (Narrow-leaved Vetch)	V. angustifolia, var. *Sativa* (Common Vetch.)
Flowers mostly solitary, of a fine crimson colour.	*Flowers* more frequently in pairs, colour not so vivid.
Leaflets long and narrow; length 6, width 1.	*Leaflets* of the proportions of 4 in length to 1 in width.
Pods long, narrow, of the same relative proportions as the leaves. Seeds small. Whole plant very delicate, and of elegant proportions.	*Pods* of the same proportions as the leaves. Seeds nearly twice the size of *V. angustifolia*. Whole plant more robust.

The V. sativa here obtained was in reality that species as it is found wild, and there is no doubt that another season of sowing will produce the still larger form in general cultivation. As a botanical question it may be doubted whether, as some authors now admit, that V. angustifolia is a variety of V. sativa. I am inclined to think that the former is the true species, and that the latter is the result of change from cultivation, the smaller form being always found in the wildest districts, whilst the larger mostly occurs in the best agricultural districts.

The V. sepium was introduced into my garden as a trial plant, on account of its flowering so early in the spring. I find that it bears the winter tolerably well, and the first summer yields a tolerable cutting of herbage: the second year, for it is perennial, increasing by stolons. This is much increased, so that at present I am inclined to the belief that this may become a valuable species, and more especially if we could succeed in getting a variety that would come to earlier maturity.

Vicia cracca is also perennial, but it does not succeed so well as the former when removed from the vicinity of bushes or some such support; besides which, its seeds are shy of germinating. However, my specimens planted in 1851 increase yearly; both these latter are readily eaten by cattle; and if found to promise well for cultivation, I have reason to hope that they will be analysed in the college laboratory with a view to determine their feeding properties.

I would now mention some facts connected with two varieties of Saintfoin—Onobrychis sativa, and common sativa var. bifera, Giant Saintfoin. The common Saintfoin is universally cultivated on the stone brashes of the Cotswolds, and where grown for the first time, generally produces a tolerable crop; but many years must always intervene before a second attempt can be made on the same land. If cut for hay, it dies out first in proportion to the advancement it has made in seeding; if, therefore, from wet or other causes, Saintfoin hay may be made late, the crop fails the next year, and this from two causes, first, seeding takes a great deal of the soil—secondly, and still more important, it seems to be a law of nature that herbaceous plants when once seeded, lose a large degree of vitality, so that on this principle Clovers and Saintfoin, when cut for hay, for the most part die out at once, when depasturing might continue the integrity of each individual root for an indefinite period.

The O. sativa var. bifera is certainly larger than the common form in my plots. It is earlier, and on cutting the first crop it yields a good second growth. Both my plots were sown in 1849; but as it is usually left to seed, in order to procure examples for lectures, it is curious to mark how gradually, yet surely, it is continually lessening. From what I have seen of the Giant Saintfoin, I am led to conclude that a trial on a larger scale would be advisable, inasmuch as the result in my plot of poor soil shows it to be a plant of extraordinary productiveness.

The Ulex europæus, common Furze, is a plant that seems to choose the poorest of soils for its habitat, though it mostly affects sandy in preference to districts of stiffer soil, so much so, indeed, that in this district the

sandy hills of the age of the Kelloway rock, which dot a line of country to the south and south-east of Cirencester, are in most cases covered with Furze, and the truly silicious beds of the old and the new red sandstone, with the tertiary sands, are always, more or less, covered with Furze. Now as these soils are in general unproductive, it becomes a matter of importance to decide whether the plant, so natural to them, can be mixed to profitable account. That Furze is readily eaten by cattle, when properly prepared, there can be no doubt, and I believe it to be a settled question that young stock do tolerably well with it; however, in order to render it fit food, it must be used when very young, otherwise it should be crushed between heavy iron rollers—a process attended with trouble and expense. I have known the plant used extensively on one Cotswold farm, in which it was prepared by crushing; here it was tried for some years, but ultimately given up as not being equal to the expense—in short it was not found to pay.

Home Correspondence.

Bread and Flour.—In reply to "John Hall," Brentwood, we do not understand why bakers charge so much for the quartern or half-gallon loaf; it has a long time been beyond the market price for Wheat, besides a very inferior flour is charged the same as for the best. As to the proper or usual charges, and again as to the yield of flour per bushel, &c., I will reply to these consecutively. 1st. If Wheat be 100*s.* a quarter, or five pounds, and five quarters make a load of Wheat, *i.e.* ten sacks, worth 25*l.*, we consider the baker's price should be 1*d.* to each pound for a gallon loaf, that is 25 pence, or 2*s.* 1*d.*—if 18*l.* a load, 1*s.* 6*d.*, and so on; but when Wheat was 17*l.* the load, the bakers were charging 1*s.* 6*d.* and 1*s.* 7*d.* per gallon loaf. The baker's reply in the village was, "The millers, sir, will only allow us a penny a gallon profit on the flour." A baker's profit on a gallon loaf is 4*d.*, which the labourer saves by baking at home, a very important fact in the economy of a cottage. The millers have made large sums of money on the sale of flour, and much very inferior stuff has been sold as best. 2dly. As to yield of flour, out of every bushel of Wheat—last year was a bad season, the yield being five gallons—ours yielded six gallons (Spalding's Wheat), which would make eight gallon loaves out of the bushel of Wheat; and we have no doubt our Wheat of this last season will yield better than six gallons of flour per bushel. There is no question the yield of flour was very much smaller last year than on average years, but the quality was not bad. If the harvest is ripe, and much rain ensues, much of the saccharine matter is washed out, and consequently the bread is not so sweet. Some deny this fact, but only "fancy" farmers I apprehend. I should say that Wheat weighing 62 lbs. to 64 lbs. a bushel, will yield in average seasons 7 to 7½ gallons of flour per bushel; but "John Hall" must remember one thing, and that is that the Wheats of last year were very light, and the yield of flour as a consequence small. We cannot conclude these remarks, however, without saying there is great blame due to millers; in times like these, Bean meal, very fine, is added to the flour, and sometimes Barley meal, &c. Then the baker, too, puts in alum (an odious ingredient) and Potatoes, which bread, when toasted, has a leathery consistency. We all know what Pharaoh did to his chief baker—it would be wrong to write it; but the tricks played upon the rich are one thing, but when they are practised upon the poor and needy in times like the present, they ought to be religiously denounced. *X. Y. Z., Hants.*

Root Graters.—"An Advocate for Pulp," in your journal of the 18th ult., remarks, "I have for years considered a machine that would reduce roots to a pulp a great desideratum, and I have often mentioned this to implement-makers." He has, however, as his letter informs us, lately received particulars of a machine of the very kind he has so long been desirous of obtaining; but, on further inquiry, it turns out to be only a "slicer," and similar in its results to Moody's patent, as manufactured by myself, which reduces the roots into thin strips: and your correspondent therefore kindly remarks that as Moody's answers the purpose well—has the advantage of being a prior invention, and is moderate in price—he would recommend it to those who require a machine upon that principle. My object therefore in writing to you is to state, for the benefit of your correspondent and those gentlemen who wish to procure "pulpers," that I manufacture a very good machine (also an invention of Moody's) which grates the root into a pulp on a principle quite distinct from the slicer, and which may be worked by a pony, reducing from 60 to 80 bushels of roots per hour. They are used by many practical agriculturists, and amongst others I may be allowed to name J. H. Langston, Esq., M.P., Sarsden, Oxford; J. J. Farquharson, Esq., Langton House, Blandford; and W. Melsome, Esq., Norton Bavant, Wilts. *W. H. Carson, Warminster.*

The Primary Use of Ammonia.—When Mr. Prideaux says (*Gardeners' Chronicle*, Jan. 14), that I seem to go to the opposite extreme, in my communication at p. 11 of the *Agricultural Gazette*, Jan. 7, I suppose he must refer to the theory of Liebig, that the carbon of plants is derived exclusively from the carbonic acid of the atmosphere. My observations, properly speaking, had nothing to do with that subject, but were directed to showing, as it appears to me, that the primary use and purpose of ammonia, in vegetable economy, is to supply hydrogen, for the formation of vegetable substance in conjunction with carbon. The course of reasoning, however, which I pursued, led me, in explanation of my views, to make use of the hypothesis, that plants derive carbon from the carbonic acid of the atmosphere, which I believe to be founded in truth; but I was far from supposing, in accordance with Liebig's theory, that the atmosphere is the only source whence plants obtain their carbon, as my remarks themselves show, wherein I observe "Apart from whatever carbon may exist in the ground, in a state fit for the use of plants, there is, &c." The entire truth probably lies between the two extreme hypotheses, which would derive the carbon of plants exclusively from the carbonic acid of the atmosphere on the one hand, and from the ground in the form of humates, &c., on the other; each having a substratum of truth to rest on. At least, this is the common-sense view which facts and appearances are calculated to suggest. Knowing the requirements of plants for carbon, and that there is a constant generation of carbonic acid going on, from animal respiration, and from the combustion and decomposition of vegetable and other carbonaceous matter, what more natural inference than that plants, which respire oxygen, are the appointed means in the economy of nature for preventing the undue accumulation of carbonic acid in the atmosphere, and for restoring to it its just proportion of oxygen, abstracted from it in the above-mentioned processes. On the other hand, again, when the gardener, from the decomposition of a heap of leaves and other vegetable refuse, has obtained a compost in which his plants flourish in the greatest health and beauty, it would be difficult to convince him that the elements of vegetable growth and development are not contained in the compost he has prepared for them. But I am unable to perceive the same foundation in truth and fact of the hypothesis which refers the composition of vegetable substance to the chemical union of water and carbon, resting, as it seems to do, only on the fact, that in certain substances, as sugar and wood, oxygen and hydrogen are found in the atomic proportions in which they constitute water. To support such a view, should it not be shown that vegetable substance generally, and not in a few isolated instances only, is so composed? But as observed by "M. J. B." in a leading article of the 7th inst., a multitude of instances may be given in which no such proportions exist. When Mr. Prideaux asks me, if I have borne in mind the above fact respecting the composition of wood and sugar, I would observe in reply, that the circumstance of two of the elements of a tertiary compound existing in proportions in which, taken by themselves, they constitute a separate compound substance, does not convey to my mind any satisfactory proof that the larger compound is a chemical union of the minor with its third element, or has in any way derived its origin from it. In the vast variety of substances, composed of three or four simple elements, may not the same fact be often observed, of two of their elements existing in proportions in which, taken by themselves, they constitute some other substance, without conveying the inference which is sought to be deduced from the composition of wood, &c. Plants certainly imbibe water in large quantity; but the phenomena observed in connexion with this fact are its existence in the sap and juices of the plant, holding in solution matters from which its substance is elaborated, similar to the blood of animals; and its exhalation by the leaves in an unaltered state, which, as observed by "M. J. B." in a recent Number, points to water as the vehicle or solvent of those substances which constitute the food of plants, and not as forming the nutriment itself from which their substance and products are eliminated. The term hydrated carbons, as applied to vegetable substances, and the special view expressed by it, give us to understand that vegetable matter is nothing but water in chemical union with a third substance, carbon; and of consequence it follows that a stronger affinity or relation must subsist between the two elements of the compound, water, than between the carbon and either of the other two elements singly. But the affinities, so far as they are cognizable from observed phenomena, appear to lie quite the other way. Take for instance wood, in which oxygen and hydrogen exist in the proportions that constituted water, and subject it to combustion; the result is the exhibition, in flame, of a gas composed of carbon and hydrogen. The igniting of the wood severs the union of the carbon and hydrogen, and it is then only, *i.e.*, on the dissolution of this union, and by the power of the same high temperature which effected it, that the hydrogen is enabled to unite with oxygen and form water. I submit, then, whatever be the proportions in which oxygen exists in vegetable substances, they are properly and truly a combination of carbon and hydrogen. Mr. Prideaux, with reference to my views respecting the purposes of ammonia in vegetable economy, directs my attention to the fact that nitrate of soda produces luxuriance of vegetation as well as ammonia. The inference intended to be drawn from this, I presume, is, that the effect is due to the avidity of plants for nitrogen; and I am willing to admit that if it were true of plants generally, it would militate against the correctness of my views. But is it so? or is it only in some special instances capable of being explained by the peculiar requirements of certain plants for nitrogen to form nitrogenous matter, that they exhibit as great luxuriance from nitrate of soda as from ammonia? In that case the effect produced by the nitrate of soda in these partial instances, so far from weakening, would help to strengthen and confirm my observations, by showing that ammonia causing a luxuriance of growth in the generality of plants, which nitrate of soda does not, it must be due, not to the nitrogen, but to the hydrogen contained in the ammonia. *J. H. H.*

Mush from Maize, Boiled Rice, Formation of Ammonia.—Mush from Indian Corn (see p. 61), is made in different ways; the simplest like flour paste. Put 5 pints of water over the fire, in a pot or skillet, then take 1 lb. of Indian meal, well sifted from the bran, and mix with a little cold water, so as to make a thick batter; add salt. As soon as the water boils, add the batter, stir it well, and keep it stirred and boiling for at least 20 minutes. It should be about the consistence of hasty pudding, porridge, or stir-about; and may indeed, be made in the same way. Take it up, and eat it with milk, butter, sugar, or treacle. In this form it can easily be made, and distributed to the poor from soup houses. Benevolent individuals, too, might prepare the mush, in their own kitchens, and give it to the hungry and destitute. This is the most manageable and convenient of all the preparations of Maize; it is used daily in a large number of American families, and considered a most wholesome diet. What is not used at one meal is cut into slices, and fried or heated upon the gridiron, at the next meal, and eaten with butter or treacle (Bartlett on Maize). —To rice, the principal objection, in passenger ships (1853, p. 810), is the long boiling it requires; for it should be thoroughly dressed, to render it most easily digestible (p. 520), and though the water may add nothing to its nutritive matter, it is an error to suppose it does not improve its nutritive quality. Beef and other flesh contain three-quarters its weight of water diffused through its entire texture, and fitting it for the action of its stomach; and it is easy to dry this water away, at a gentle heat, and leave the meat as hard as rice. But eaten in that state it will not produce half the nourishing effect it does when properly cooked. And our aliments generally, in their most digestible and nourishing state, contain from 40 to 60 or more per cent. of water (butter, cheese, sugar, &c., excepted).—"J. H. H.," on the formation of ammonia from hydrogen, says (p. 59) that a heap of vegetable matter, containing no appreciable nitrogen, emits a pungent odour of ammonia, in properly managed fermentation. With due deference, let me ask if this is not a mistake? it is contrary to my experience, as well as reading; in both which, non-nitrogenous matters generally ferment acid. If his statement is drawn from actual experiment, the details may be of considerable value to your readers. *J. Prideaux.*

Management of a Small Farm.—At page 93 "J. L." asks advice on the management of his small farm. I have had a little experience in spade husbandry in a small way, and so venture to give him my opinion. "J. L." has 13 acres of land; 10 pasture, 3 arable. The plan which I should adopt, were I in his place, would be to break up 2 more acres of the pasture, and introduce the following rotation:—1 acre Wheat followed, on three parts of it, by Vetches, Rye, and Trifolium, one part turned up rough; 1 acre roots, as Mangold, Swedes, &c.; 1 acre Barley, 1 acre Clover, 1 acre Potatoes. There will thus be 3¾ acres to be dug yearly. Hacking will do for putting in the Vetches, &c., after the Wheat. Supposing he keeps three cows and one breeding sow, and a few poultry,—the cows will require the Vetches, &c., and second cutting of Clover during the summer; and the hay made from the first cut of Clover, with that from 1 acre of pasture, with ¼ an acre of the roots, will be sufficient for the winter. The Barley, with small Potatoes and roots, will supply the pigs and fowls. The Wheat for home consumption, also the Potatoes, with several sacks for sale. There will thus be left 7 acres of pasture, on which, if no other stock were kept, he might keep some sheep, but how many I cannot say. I estimate the labour required at one man and one woman constant. A man can dig an acre in 20 days; supposing that 80 days are consumed in digging, 80 more, with the help of a woman, would be sufficient for the cultivation of the crops. Thus there would be a wide margin for wet days, feeding and milking. I should recommend "J. L." to dig his land with the steel forks, which do their work well. *Clericus.*

Societies.

ROYAL AGRICULTURAL SOCIETY.

MONTHLY COUNCIL, *March* 1.—Mr. PUSEY, President, in the chair.

The following new members were elected:

Cust, Captain Henry, Cockayne-Hatley, Biggleswade
Severn, Frederick, Lullington, Burton-on-Trent
Cresswell, R. Ward, Ravenstone, Ashby-de-la-Zouch
Hetherington, Robert, Manor House, Ropley, Alresford
Clarke, Edward, Glentworth, Lincolnshire
Bailey, William, Oaken, Wolverhampton
Rotton, Richard, Watford, Hertfordshire
Horwood, Matthew, 2, Hatton Court, Threadneedle St., London
Worsley, Lord, Brocklesby Park, Ulceby, Lincolnshire
Butler, Major, Liphook, Hampshire
Edwards, Frederick, Frood Farm, Carmarthen
Simpson, John, High Street, Lincoln
Thackeray, Captain, Faubourg St. Honoré, Paris
Parry, Thomas A., Bitham House, Banbury, Oxon
Bloodworth, Charles, Kimbolton, Huntingdonshire
Spenser, Edwin, Leominster, Herefordshire
Banfield, Thomas C., 18, Queen Square, Westminster
Griffin, Frederick C., Methwold, Brandon, Norfolk
Harrison, John, jun., Heaton-Norris, Stockport, Cheshire
Widdecombe, John, 7, Old Palace Yard, Westminster
Crossley, Robert, Holland Street, Newton, Manchester
Budd, William, Aston-le-Walls, Daventry, Northampton
Parton, John, Cow Lane, Newton, Manchester
Chaffer, Benjamin, Burnley, Lancashire
Llewellyn, L., Trispenllwch, Swansea, Glamorgan
Keyworth, Thomas M., Cottesford Place, Lincoln
Kitson, William, Torquay, Devonshire

Morris, George, Kirmond, Market-Rasen, Lincolnshire
Richardson, Robert, Appleby Castle, Westmoreland
Bourton Thomas, Baunton, Cirencester, Gloucester
Donne, Rev. Stephen, Oswestry, Salop
Bond, Robert, Thorington, Saxmundham, Suffolk
Biddell, Manfred, Playford, Ipswich, Suffolk
Reeve, James, Randall's Farm, Leatherhead, Surrey
Holborow, Daniel, Knockdown, Tetbury, Gloucestershire
Ewens, John Samuel, 4, Arthur Street West, London Bridge
Roscoe, W., Ensbury, Wimborne, Dorset
Ellison, Lt.-Colonel, Boultham Hall, Lincoln
Voelcker, Augustus, Phil. D., R. A. College, Cirencester
Iles, Daniel, Fairford, Gloucestershire
Freeman, Thomas, Henham, Wangford, Suffolk
Daniell, Thomas, West Bergholt, Colchester, Essex
Tovey, Robert, jun., Fairford, Gloucestershire
Biggs, Joseph, Barden House, Tonbridge, Kent
Prescott, Francis, Castle Farm, Dover, Kent
Allen, Ralph, Bathampton, Bath, Somerset
Dudding, Richard, Panton, Wragby, Lincolnshire
Brewster, James, 1, Granville Square, Pentonville
Ruddock, Joshua, The Terrace, Putney, Surrey
Frost, Charles, Wherstead, Ipswich, Suffolk.

The names of 34 candidates for election at the next monthly meeting were then read.

FINANCES.—Mr. Raymond Barker, chairman of the Finance Committee, read the report on the accounts of the Society; from which it appeared that the current cash-balance then in the hands of the bankers (including the Lincoln subscription) was 1599*l.*

REDUCTION OF EXPENDITURE.—Col. Challoner reported progress, on the part of the Reduction of Expenditure Committee, and obtained further time for the sitting of the committee.

LINCOLN MEETING.—The Hon. Leslie Melville, Vice-Chairman of the General Lincoln Committee, presented the report of that committee, which was postponed for further consideration.

PROTESTS.—On the motion of Mr. Thompson, seconded by Mr. Milward, the following resolution was passed: "That it be an instruction to the stewards to endeavour if possible to decide all protests against the awards of the judges, at the country meeting, before the conclusion of the meeting; that such protests shall be delivered to the stewards, at the directors' office, in the show-yard, before 6 o'clock on the Thursday evening of the show-week; and that no protest shall be *subsequently* received, unless satisfactory reasons be assigned for the delay."

TRUSTEE.—On the motion of Mr. Fisher Hobbs, seconded by Mr. Thompson, Sir John Villiers Shelley, Bart., M.P., was elected one of the Trustees of the Society, in the vacancy created by the decease of the Hon. R. H. Clive.

GUANO SUPPLY.—On the motion of Mr. Fisher Hobbs, seconded by Mr. Woodward, the following special committee was appointed, for the purpose of taking into consideration the present position of the guano supply, and of offering to the Council any recommendation of measures to be taken by them in reference to that question: namely, the President, Duke of Richmond, Earl of March, Lord Berners, Sir John Shelley, Sir John Johnstone, Mr. Bramston, M.P., Mr. E. Denison, M.P., Mr. Barrow, M.P., Col. Challoner, Mr. Raymond Barker, Mr. Thompson, Mr. Woodward, Mr. Lawrence, Mr. Caird, and Mr. Fisher Hobbs. The Council directed the committee to be summoned for Wednesday next, and requested Mr. Fisher Hobbs to act as its Chairman.

IN-CALF HEIFERS, intended for exhibition at the Lincoln meeting, must be bulled before the 31st of March, and will only receive prizes that may be awarded to them in the event of their producing live calves before the 31st of January next.

The Council adjourned to the 8th of March.

Reviews.

The Distribution of Heat over the Surface of the Globe. Taylor and Francis. London, 1853.

THE beautiful maps, presented by Professor Dove, of Berlin, to the British Association for the advancement of Science, representing the temperatures in the different months of the year over the globe, are most important contributions to the science of meteorology, and they bespeak the industry of their distinguished author; we wish to make a few remarks in regard to his views on the atmospheric currents of our northern latitudes with reference to the remarkable snow-storms of this winter.

Professor Dove has been led to consider that there are just two atmospheric currents, which flow side by side, in the northern latitudes; one current being directed towards the poles, the other towards the equator. In his view, when a south-west wind is blowing in our latitude, a north-east wind must also be blowing somewhere else to maintain the equilibrium of atmospheric pressure. In many instances which have come under our observation very opposite climatic conditions are sometimes existing in two different stations, and at no great distances from each other, and the views of Dove give us a very satisfactory explanation. He has been further led to believe that storms are formed, of a rotatory character, when the north-east and south-west winds come in contact with each other. It should be borne in mind, however, that this view is quite opposed to the theory of rotation which has been advocated by Mr. Redfield, and adopted by many others, although those two theories are often confounded; he says:—

"It is evident from the researches that I have already published on the non-periodic variations of temperature, that opposite conditions of weather usually prevail simultaneously in the same parallels under different meridians; and that in particular, America and Europe usually present such an opposition, so that a severe winter here corresponds to a mild one there, and *vice versa*. On these phenomena is grounded the assumption on which the explanation of the law of rotation rests, viz., that there are, properly speaking, only two atmospheric currents on which our relations of weather depend—a polar and an equatorial current—which within the tropics flow one over the other, but beyond the tropics flow beside each other in variable channels.

"As colder air occupies less space than warmer air, it follows that the polar are narrower than the equatorial currents. Therefore, the existing atmospheric equilibrium necessarily implies a preponderance of southerly winds (in the northern hemisphere); which from the earth's rotation become south-westerly ones." (Page 20.)

It would appear that the east winds which prevailed in December last, and gave us such cold weather, continued their course right across the Atlantic. A Canadian gentleman who left New York that month, informed us the other day that the wind "cut the steamer's masts all the way," and that it was four days later than usual in reaching Liverpool. The winter also in Canada had been longer in setting in than had been the case for many years. This is a good illustration of the truth of Dove's remark.

The predominance of south-west winds in our latitude is too great to be accounted for on the supposition that the colder and less frequent north winds which blow at the surface of the ground can afford the necessary compensation for maintaining the barometer at a medium pressure. And besides, as Dove has fully admitted that the prevalence of north-west winds on the east coast of the United States, and also in Canada and Greenland, is the cause of the severe winters, it may be asked what becomes of this current which flows into the Atlantic from the American continent? This current does not reach the European coast—if it did so our winter would be much more severe, as it is well known the thermometer rapidly sinks when the wind goes to the north-west; and also if there was truth in the law that the earth rotating on its axis converts a south wind into a westerly one, we should also expect that the north-west wind which flows into the Atlantic from America should be converted, first into a north one and afterwards to an east wind. That this does not happen is seen in the predominance of south-west winds in the Eastern Atlantic.

The solution of this matter appears to be, that part of this north-west American current reaches Europe by flowing as an upper current. This is a very common phenomena, although it has not been much taken notice of. The lower portions are converted into south-west winds as they cross the Atlantic, by the lower strata becoming heated, which overturns the connection, encouraging the mixture of the air of different specific gravities through vertical gyrations. This is one of the forces that propel the south-west winds in furious gales.

We do not doubt that a north wind is sometimes converted into an east one as the effect of the earth's rotation. There is evidently a great sympathy or connection between the north and east winds, such as those of December last. But instead of the polar current being in general easterly, as this physical law would lead us to expect, it is commonly from the north-west. Humboldt made this observation many years ago, on comparing the logs of vessels navigating the Atlantic. It appears that the polar current, instead of always flowing side by side with the equatorial, more commonly flows as an upper wind from the north-west. This relation of the two currents is very common in our latitude, our mild winters also result from this action; but we cannot enter further on this subject at present.

The severe storm of snow which occurred in Aberdeenshire in the end of December last (from the 26th to 31st) seems to have been a mere modification of what is seen in those storms which veer from south-west to north-west. Previous to this storm the wind had been northerly for some days, but the surface wind changed to a more westerly direction, and brought more moisture with it; on the north upper current asserting its sway at the surface of the ground snow was precipitated, and the quantity was greater as the country was more elevated over which the currents rise. Nearly 20 inches of snow seem to have fallen with the north wind in Aberdeenshire, while the Lowlands of Scotland were visited with a hard black frost.

Throughout the greater part of December the winds were easterly or northerly in Britain. The warming influence of the south-west winds was little felt. The weather, however, was very wet about the 19th in Devonshire. The rains in that county were evidently caused by the equatorial current setting in as an upper wind, while the east wind still prevailed below, and at last drove back the south-west wind above, and restored the cold weather. The east wind, indeed, seems to have maintained its supremacy till the beginning of January, when a severe conflict took place between the east wind as an under current and the south-west wind as an upper, resulting in the latter gaining the ascendancy, and at length freely flowing over the whole island, and causing a great rise in temperature. Before this was brought about, an immense quantity of snow fell, and was driven about by severe gales, of which we shall shortly notice their mode of action.

At the end of last year the frost was very intense over our island; the south-west wind, however, was flowing as a surface wind in Jersey as early as the 2d of last month, and a thaw was established. On the 3d and 4th the wind there backed to the east, and an inch and a half of rain fell on these days, but the rapid fall of the barometer probably indicated that the south-west wind was still flowing as an upper current. From the 5th to the 9th the south-west wind was again established in Jersey.

The wind seems to have set in very briskly from the north-east over the south of England on the 3d, and continued in the same direction on the 4th and 5th. The east wind, instead of producing rain, as in Jersey, through its inosculation with the relatively warmer current from the south-west, brought about a remarkable fall of snow over the greater part of England, during the days we have just mentioned. At Bath, our correspondent informs us the weather had moderated by the 6th, and the south-west upper current had so far tempered the east wind that a sudden thaw with rain set in by the afternoon. On the 7th the wind still lingered in the east, but changed to south-west by afternoon, and continued from this quarter all the 8th, when the day was fine. On the 9th the weather was misty, and the wind was turning its face to almost every point of the compass.

As we proceed further north, we find the struggle between the two antagonistic currents—the south-west upper, and the north-east under—a little later in commencing, but much longer in terminating.

In the middle districts of Scotland, the weather was clear and calm on the 3d. The thermometer in the morning at one station had been down to 12°, little symptoms of change were visible, people were only wondering at the low and falling barometer. Slight cirrus clouds, however, were stealing over the zenith from the west. Another night of hard frost succeeded. On the 4th, the thermometer rose somewhat rapidly to 34°, and continued at this point for more than 36 hours. A strong gale had set in from the east. The east coast of Scotland and north coast of England on the 4th and 5th were "vexed" by one of the strongest eastern gales that has occurred for years; very little snow fell there on these days, but more on the 6th, when the temperature had again fallen to 30°, with little wind. On the 7th, the temperature was 11° at 8 o'clock A.M., but by noon the thermometer rose to 36° with rain. This rapid rise of temperature was caused by a strong upper current from the south-west, although the north-east wind again blew furiously below, and it swept all the snow off at a temperature of 38°. The wind continued from this quarter until it drove back the south-west currents; the temperature gradually fell, and on the 10th the country was again covered with 4 inches of snow.

It is worthy of observation, that while little snow fell on the 4th and 5th of January on the east coast of Scotland, more fell in the south-west of Scotland, and in the north of Ireland. In Belfast there was a considerable fall of snow on the 4th, with a strong wind from the north-east; and in various localities not far from that town, the snow was several feet deep. The north-east wind was comparatively dry on the Scottish coast, but it was precipitating snow in immense quantities over England and Ireland from the south-west upper current, which was affording the materials. It is very generally supposed that it seldom rains on the west coast of Britain, as in Ireland, when the wind is east; this storm, however, is a good instance out of many which might be cited for a contrary opinion. In fact, we believe that quite as much rain falls on the west coast of Britain, and also in Ireland, with east winds, as on the east coast, but the excess of moisture in the former localities arises from the greater quantity which falls with west winds. A rather curious and tantalising example of the dryness of east winds on the east coast, while they were raining in the more inland parts of the country, occurred last season in Scotland. For a few miles inland, along the coast of East Lothian, Fife, Forfar, and also over a great part of the county of Aberdeenshire, the summer was the driest which has occurred since 1826; in some localities there was not enough moisture to braird the late-sown Barley and the Turnips, while a few miles to the westward the rains were in great excess, although the wind was mostly from the eastward, with an upper current from south-west. It is only under such conditions that great falls of rain or snow occur in Britain with east winds. But how delicately are the conditions of precipitation often balanced, and how nicely are their limits prescribed to confound those who ignorantly pretend to foretell the nature of the weather in particular localities!

After the snow-storm in the south of England on the 3d, 4th, and 5th of January, the temperature rose considerably, and the wind went to the south-west. In the north of Scotland there was a much greater store of dry cold air, which kept the south-west wind much longer in check, although it is very probable that it existed in the higher strata of the air as early as the 3d of January. We give a few particulars of the weather at a station 35 miles from the sea, and 600 feet above its level, in Strathdon, in Aberdeenshire, for the purpose of comparison.

Jan. 3. Intense frost, 5° below zero; barometer falling.
Jan. 4. Intense frost, 6° below zero at night; 12° at noon.
Jan. 5. Minimum temperature 12°; cirrus from the south-west; wind below south-east with dry hail showers; barometer still falling.
Jan. 6. Wind east-south-east; frequent showers of snow; barometer 28.42; minimum temperature 10°.
Jan. 7. Cirrus still passing from the south-west; wind below east; thick snow falling all night; temperature 38°.
Jan. 8. Dense fall of snow; gale from east-north-east; upper current south-west; barometer rising.
Jan. 9. Steady fall of dry snow, with cumulo stratus from the east; gale abating; cirrus in masses from a westerly point; temperature 28°.
Jan. 10. Minimum temperature 6°; clear and nearly calm; snow now lying 32 inches in depth where not removed by the wind.

In Strathdon the frost continued until the 16th. The Don was closely frozen over, the general thickness of the ice being from 10 to 18 inches. The warm south-west winds were at length sweeping over Grampian and Lowland by the 17th, and this Polar scene soon began to dissolve. On the 19th "the whole ice on the river was in motion;" here and there a bridge dammed back the torrent for a time, till it gained strength to sweep the

frail barriers before it. "In the space of 20 miles of the upper part of the Don, some 10 or 12 bridges have been entirely destroyed."

Many of the particular phenomena of the storm at which we have very cursorily glanced, are very suggestive of remark, but here it would be entirely out of place to enter upon. We would, however, direct the attention of meteorological observers to mark the different currents in the atmosphere, as the only means by which the laws which regulate the aerial disturbances can well be traced. We are thoroughly persuaded that little advancement will be made in this department of meteorology until this subject is more attended to by observers.

We would only remark, in conclusion, that it is altogether out of the question to explain the action of the storm of 3d, 4th, and 5th Jan., either upon Mr. Dove's theory of horizontal rotation, or that proposed by Mr. Redfield, as insuperable difficulties meet us at every step, and the same may be said of all the storms of our high latitudes. The centripetal theory of storms, which was proposed by Mr. Espy, is really nearer the truth than either of the other two, and accounts for the bearings of the wind quite as well. We are convinced that all the secondary phenomena of British storms will admit of being satisfactorily explained through the action of the different strata being unequally heated. If there is any rotation it is vertical and not horizontal. Mr. Redfield's theory has been very generally received by scientific men, but there is very little harmony in their expressed views, which are often entirely opposed to the laws of that science which the sagacity of Dalton traced out, when the actual phenomena are investigated. *R.*

Miscellaneous.

Improvements in Agricultural Implements employed in Crushing and Rolling Land, and in frames for the same. By G. Harriott, Islingham, Frindsbury, Kent. Patent granted May 28, 1853. (No. 1314.)—*Claims:* 1. The constructing of implements for crushing and rolling land from a cylinder or cylinders with a screw thread on the outer surface, as described. 2. The constructing of compensating spring-frames for rollers employed in the rolling and crushing of land. *Mechanics' Magazine.*

Calendar of Operations.

FEBRUARY.

SOUTH DEVON, *Feb.* 28.—We have had one of the finest months of February known for years past, and everything is progressing accordingly. During the past fortnight the sowing of Oats has been the principal farming operation. Preparations are also being made for Potato culture; and notwithstanding the numerous reverses Potato-growers have met with, it appears likely that there will be a large breadth again planted. The orchards are now claiming their share of attention, and old trees are being removed, to be replaced by younger ones; this, unfortunately in too many instances, is regarded as a trifling operation, whereas, to an orchard estate it forms one of the most essential features; the selection of young trees, both as regards sorts and quality of plants, as well as preparing the pits for them, cannot be too forcibly impressed on the minds of those who hold orchards. The young Wheats are now getting in good order for rolling and crushing, and on the whole look very favourable. The lambing season has generally been a fortunate one, and many fine lambs may now be seen about the country. Prices of farm produce still continue good. Wheat, 80*s.*, Barley, 38*s.*, and Oats, 28*s.* per quarter; beef, 5*8s.* per cwt., mutton, 6*d.* to 7*d.* per lb.

WESTER ROSS, *Feb* 28.—Notwithstanding the wetness of the weather and the dampness of the soil, the ploughs are again busy turning over the ground, preparatory to sowing in the spring seeds. Wheat sowing, that was not overtaken in autumn, is now proceeded with; and by the time the whole is accomplished there will be more than an average breadth sown. Later autumn-sown Wheat has, at last, come well above ground, and presents a thicker braird than, from the severity of the winter, might have been expected. Cattle in open courts and sheep exposed to the vicissitudes of this inclement season, have scarcely thriven so well as in ordinary winters; but, as Turnips are yet abundant, and with a genial spring, much progress may be made. Grain, after having fallen somewhat in price, is again firmer, and tending upwards. Potatoes, fortunately for the Highlands, have lately increased in value. Farmers in this quarter have been in the habit of giving ground to the poor people in which to plant Potatoes, and all that the farmer received in return was the benefit derived by the land from their manure, after having grown their crop of Potatoes. From the increased value of Potatoes, the habit bids fair to be done away with, as it is now greatly more advantageous to the farmer to grow Potatoes for himself. There will, very likely, be a larger quantity of Potatoes planted this season, in this quarter, than there ever was in any former year. Horses now sell uncommonly high; and we look forward to a brisk demand at remunerating prices for both cattle and sheep. The farmer, in the midst of this unlooked-for prosperity, rejoices exceedingly, and anxiously desires many returns of such a season.

Notices to Correspondents.

BANTAMS: *Constant Reader.* We do not know of any publication likely to meet your demands. Were the "Poultry Book" a less expensive work, we should recommend that as likely to give the required information.

CARBONATE OF SODA: *Constant Reader.* Certainly; other manure ought to be added. We have looked through the records of numerous experiments without finding results of the kind you desire, viz., the effects of carbonate of soda *alone* on Mangold Wurzel, Potatoes, and Turnips. Perhaps some of our readers may help you

GUANO: *J H Guano.* It deteriorates wherever and whenever it makes its presence known by smell; but if kept in bags in a dry and close cellar, it may be considered practically safe.

MEADOW LAND: *A Reader.* If soot and gypsum are both easily to be had near, we should be inclined to mix 20 bushels of the former with 2 cwt. of the latter per acre, and spread them broadcast over the field.

MILK: *E G.* Milk contains butter, curd, sugar, water, and mineral matter—chiefly phosphate of lime.

WIREWORM: *J L H.* There is no remedy except constant stirring of the land and exposure to frost. Pressure, too, which acts on an altogether different principle, has been said to check its ravages; and Crosskill's clod-crusher was highly praised for its services in that respect. When the land is occupied by a crop which you wish to save, the latter is the only remedy left you.

ERRATUM. For "too," in the 11th line from the top of col. *a*, p. 122, read "*was*;" and for "*was*," immediately below it, read "too."

GLASS.

THOMAS MILLINGTON, Importer of Foreign Sheet Glass, requests attention to the present Prices of Glass and Stock sizes, which are cheaper and better than those of English manufacture:—

IMPROVED PATENT ROUGH PLATE, PLAIN, FLUTED, AND IN QUARRY PATTERNS.
British Plate, Patent Plate, Sheet, Crown, and Coloured Window Glass. Pure White Shades for Ornaments.
Pumps, Water Closets, and Plumbers' Brass Work. Genuine White Lead, Paint, Colours, Varnishes, Brushes, &c.
Tariffs of the above on application to

T. MILLINGTON, 87, Bishopsgate Street Without, London.

HARTLEY'S PATENT ROUGH PLATE GLASS, 1-8th thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th, or 4 lbs. to the foot, for Ridge and Furrow Roofs, Greenhouses, Railway Stations, Engine Sheds, Mills, Market Halls, and Public Buildings generally.

For further information apply to JAMES PHILLIPS & CO., London Agents, 116, Bishopsgate Street Without.

"Rough Plate has never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

"There *can be no question now* that Rough Plate Glass is the most beautiful, as well as the most useful, kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, *without a single disadvantage as a set-off.*"—*Gardeners' Chronicle.*

"ROUGH PLATE GLASS.—We should have no hesitation in using this for a Vinery—INDEED WE SHOULD SELECT IT."—*Cottage Gardener.*

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

HETLEY AND CO. are supplying 16-oz. Sheet Glass of British Manufacture, packed in boxes, containing 100 square feet each, at the following REDUCED PRICES for cash. A reduction made on 1000 feet.

Sizes.—Inches.	Inches.		Per foot.	Per 100 feet

White Lead, Oils, Turps, Colours, &c.
G. FARMILOE & SON, 118, St. John Street, West Smithfield.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

ALFRED KENT'S PATENT WEATHER-PROOF GLAZING WITHOUT PUTTY.—For Horticultural Buildings in Wood or Metal.

HORTICULTURAL BUILDING WORKS, CHICHESTER.

Illustrated Books describing inventions, containing prices and particulars relating to the different designs, sent on receipt of four postage stamps. Nurserymen and others appointed agents on application.

Horticultural Buildings upon this plan having been erected in many different parts of the country, and having stood the trial of all weathers, and more especially the severest of all, viz., frost, A. KENT, with full confidence, strengthened by the many flattering testimonials he has received, can safely guarantee the proper working of his Patent System of Glazing. Estimates and Plans sent, including Heating by Hot Water.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

PATENT GLASS TUBES, Iron Coated with Glass, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Sluice Cocks, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of

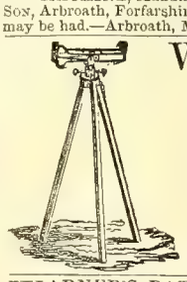
FREEMAN ROE,
HYDRAULIC ENGINEER,
70, Strand, and Bridgefield, Wandsworth.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*

WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

PATENT ROOT GRATING MACHINE.

BUSHE & BARTER'S PATENT ROOT GRATING MACHINE, Manufactured and Sold by ALEX. SHANKS & SON, Arbroath, Forfarshire, from whom particulars, with prices, may be had.—Arbroath, March 4.



WEIR'S DRAINING LEVEL, PRICE 30*s.*

These Draining Levels have lately been greatly improved; they have stood the test of five years' use, during which upwards of 1000 of them have been sold. They are so simple that any labourer who can read can use them. They require no graduated staff, the index telling at once the rise and fall in inches without any computation.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, (6 Doors West of the Hampstead Road), Removed from Oxford Street.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£ *s. d.*
Patent Pump	1 15 0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3 0 0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation [illegible]

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,
8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water; Fire Engines, &c.
An Illustrated Book sent on application post free.

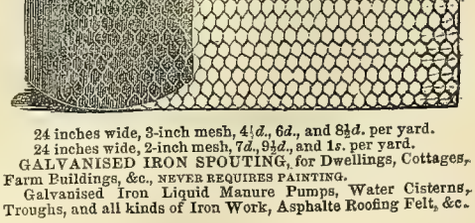
WIRE FENCING, 6¾*d.* per Square Yard, in various widths from 6 feet to 15 inches, mesh less than 2 inches. An effectual fence against Hares, Rabbits, Sheep, Deer, &c., and for the enclosure of Poultry, Pheasants, &c.; 4 inch mesh, 4*d.* per square yard.—R. RICHARDSON, 21, Tonbridge Place, New Road, London.

BLOSSOM OF FRUIT TREES.—WORSTED NET to effectually protect the blossom of wall fruit trees from frost and blight, and the ripe fruit afterwards from wasps and flies, 7*d.* per square yard, in various widths. All kinds of garden, fishing, and sheep nets, made by machinery, and at very low prices.—R. RICHARDSON, 21, Tonbridge Place, New Road, King's Cross.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, 17, Smithfield Bars, City, and Old Kent Road, Southwark, where may be seen erected Emigrant Tents in great varieties, on their latest improved principles, and also at Brunswick Street, Poplar, near the East India Export Dock.

TANNED GARDEN NETTING for protecting Fruit Trees from frost, blight, and birds, or as a fence for fowls, pigeons, Tulips, and seed beds, can be had in any quantity from JOHN KING FARLOW'S, Fishing Tackle and Net Manufactory, 4 and 5 Crooked Lane, London Bridge, at 1½*d.* per yard one yard, 3*d.* two yards, or 6*d.* four yards wide. Carriage free on all orders over 20*s.*, accompanied by a Post Office order, or London reference. Rabbit, Sheep, and Fishing Nets of every description in stock or made to order.

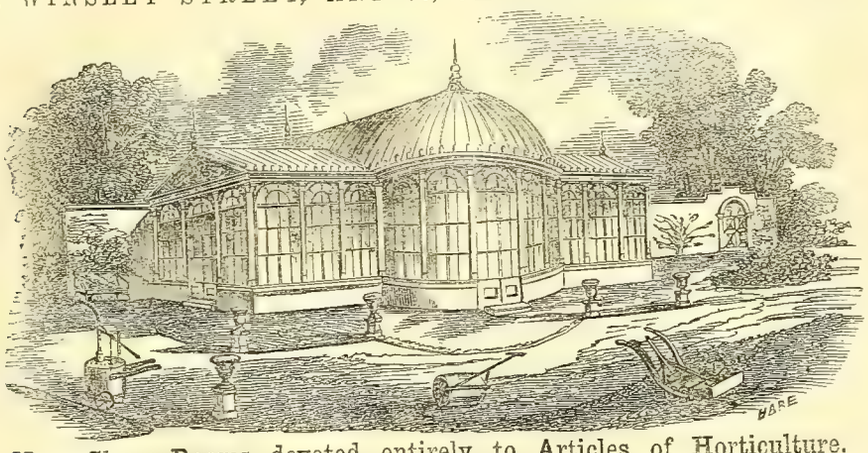
H. J. MORTON AND CO., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4½*d.*, 6*d.*, and 8½*d.* per yard.
24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.
GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.
Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

COTTAM AND HALLEN,

2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.



New Show Rooms devoted entirely to Articles of Horticulture.

ILLUSTRATED CATALOGUES UPON APPLICATION.

AGRICULTURAL LIST UPON APPLICATION.

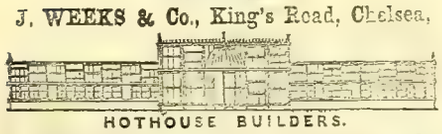
EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

HORTICULTURAL BUILDINGS, ROCK AND RUSTIC WORK, ORNAMENTAL WATER, FOUNTAINS AND FALLS, AND LANDSCAPE GARDENING, executed on the best principles: Estates Improved, Land Laid Out for Building, &c., by Mr. GLENNY, Valuer, Estate and Horticultural Agent, 420, Strand.

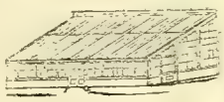
HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

To Nobility, and Gentry about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

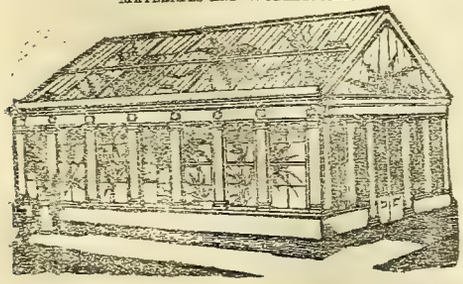
The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



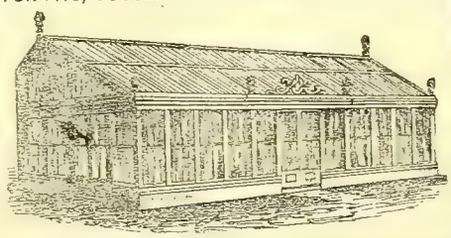
GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

GREEN AND HOTHOUSES made by machinery at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Warranted of best materials; being made by steam-power, they are put together in a superior manner; one trial will prove these Buildings to be the cheapest and best made in England. 1½ in. Greenhouse lights at 3*d.* per foot; 2 in. at 4½*d.* per foot. Lists of Prices by enclosing two postage stamps.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.



JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in. 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

MORNING FROSTS.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey. (Removing in May next to 112, Regent Street, London.)

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

ADAMSON'S REGISTERED ORNAMENTAL GARDEN EDGING, a cheap, durable, and perfect substitute for all other Edgings, for Conservatories, Terrace Walks, or Garden Borders, being of an agreeable colour, a thorough drain for the walks, applicable to borders of any form or size, and does not harbour vermin. To be obtained only of the Inventor and Manufacturer, T. H. ADAMSON, Jun., Builder, High Street, Putney, where Prospectuses may be obtained on application.

May be seen laid down in the Horticultural Society's Gardens, Chiswick, where it has withstood the late severe winter.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. Price complete, with vulcanised India-rubber suction tube, with galvanised spiral inside, and covered with cotton outside, 25*s.* each. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

THE POTATO DISEASE.

FRESSON'S "ANTI-POTATO BLIGHT" is a certain remedy for the above. To insure a sound and healthy crop, dress your "SEED POTATOES," before sowing them, with the above.—Sent free (on receipt of 13 uncut postage stamps) with easy directions for use. Also, A Treatise on the Cause of the Potato Blight, with the means of eradicating it; by FRESSON, Agricultural Chemist, Stevenage, Herts.

TOBACCO PAPER! TOBACCO PAPER!—The cheapest and most effectual article for smoking Greenhouses, and destroying the Fly on Plants, is Genuine Tobacco Paper, which JOSEPH BAKER, of 73, Fleet Street, can supply in large quantities, at 1*s.* per lb.; and if under 7 lbs. at 1*s.* 2*d.* per lb. Post-office Orders payable at the Strand Office.—JOSEPH BAKER, 73, Fleet Street, London (opposite the *Dispatch* newspaper).

EVERY THING FOR THE TOILET AT MECHI'S MANUFACTORY, 4, LEADENHALL STREET.—Superior Hair, Nail, Tooth, Shaving, and Flesh Brushes, Clothes and Hat Brushes, Combs, Washing and Shaving Soaps; various Nail and Corn instruments, Razors, Razor Strops and Paste, and Shaving Powder, Ladies' and Gentlemen's Dressing Cases, with or without fittings, in Russia Leather, Mahogany, Rosewood, and Japan-ware; Ladies' Companions and Pocket Books elegantly fitted, also Knitting Boxes, Envelope Cases, Card Cases, Note and Cake Baskets, Beautiful Inkstands and an infinity of *récherché* articles not to be equalled.

TO CAPITALISTS.

THE ADVERTISER, who has secured portions of several valuable Mineral Properties at prices much below their value, wishes to meet with a Capitalist, who will join him in the purchase, and provide the requisite amount for a short period. The highest Testimonials to the value of these properties will be produced, and are confirmed by actual results. They will pay a large interest on the amount invested, and involve no risk or liability. The fullest information will be given to *bonâ fide* applications from Principals or their Solicitors.—Address Post-free, Mr. SCOTT, Messrs. Gogin and Co., 320, Regent Street.

A GENTLEMAN, about to leave for Australia, and who has had considerable professional practice in Ornamental Gardening, is desirous of Disposing of his Plans and Specifications. Rural Architecture could be very advantageously combined.—A. B., 50, Office of this Paper.

TO GENTLEMEN BOARDERS.—The Advertiser has a vacancy for one or two young gentlemen desirous of acquiring a knowledge of Agriculture in all its branches, the Breeding and Feeding of Stock, &c., &c., in one of the best cultivated districts in the kingdom, where they would have the advantage of an experienced neighbourhood, and a comfortable home.—For particulars, apply to A. Y., Office of this Paper.

QUALITY THE TEST OF CHEAPNESS.

BERDOE'S LIGHT OVERCOATS AND CAPES resist any amount of rain. One of the largest Stocks in London of Superior GARMENTS at Lowest Charges. First-Class DRESS COATS, 3*l.*; BOY'S SUIT, 11*d.* per inch, according to height.—96, New Bond Street, and 69, Cornhill. (Nowhere else.)

FORD'S EUREKA SHIRTS, Plain and Coloured, the latter in cloths of every variety of pattern—stripes, curves, bars, spots, sprigs; in short, every figure that art can describe and taste approve. Six for 27*s.* Patterns to select from on receipt of six penny stamps. Price lists free on application. —RICHARD FORD, 38, Poultry, London.

HEAL & SON'S ILLUSTRATED CATALOGUE of BEDSTEADS, sent free by post; it contains designs and prices of upwards of 100 different Bedsteads, in iron, brass, japanned wood, polished birch, mahogany, rosewood, and walnut tree woods; also of every description of bedding, blankets, and quilts.—HEAL & SON, Bedstead and Bedding Manufacturers, 196, Tottenham Court Road.

METCALFE AND CO.'S PERFUMERY DEPARTMENT.—PROPRIETARY ARTICLES. — METCALFE'S celebrated ALKALINE TOOTH POWDER is acknowledged as the safest and most efficient now in use. Dupuytren's Medicated Pomade is the most certain remedy for preventing the hair prematurely falling off, and for restoring it when baldness has already commenced. Dupuytren's Medicated Balm strengthens, cleanses, and improves the growth, and is generally acknowledged as the best wash for the hair.—Manufacturers of British and Importers of Foreign Soaps, Perfumery, and J. M. Farina's genuine Eau de Cologne, at METCALFE, BINGLEY, & Co.'s only Establishment, 130B and 131, Oxford Street, second and third doors west from Holles Street.

QUANTITY AND QUALITY OF THE HAIR.

NO TOILET can be considered complete without a careful attention to that department which so materially affects the entire contour, viz., the Hair, which, both in quantity and quality, is susceptible of the most material alteration. That which is weak can be strengthened, and be made to receive a most beautiful gloss by artificial applications. It is to its extraordinary and valuable properties in these respects that is due the character of C. AND A. OLDRIDGE'S BALM OF COLUMBIA, for its invigorating, nutritious, and regenerative qualities. OLDRIDGE'S BALM causes Eyebrows to grow, prevents the Hair from turning grey, and the first application causes it to curl beautifully, frees it from scurf, and stops it from falling off. Price 3*s.* 6*d.*, 6*s.*, and 11*s.* per bottle. No other prices are genuine. — N.B. Ask for OLDRIDGE'S BALM, 13, Wellington Street North, Strand, London.

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL possesses singularly nourishing powers in the growth, restoration, and improvement of the human Hair, and when every other specific has failed. This celebrated Oil is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. Its operation in cases of baldness is peculiarly active; and in the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulating operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3*s.* 6*d.* and 7*s.*; Family Bottles (equal to four small), 10*s.* 6*d.*; and double that size, 21*s.* CAUTION.—On the wrapper of each bottle are the words, Rowland's Macassar Oil, in two lines. The same are engraven on the back of the wrapper nearly 1500 times, containing 29,028 letters.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

HOLLOWAY'S PILLS PRODUCE THE MOST BENEFICIAL EFFECTS IN ALL COMPLAINTS OF THE LIVER, INDIGESTION, &c.—Officers in the Army and Navy, before proceeding abroad, should provide themselves with a supply of HOLLOWAY'S Pills, as change of climate frequently causes an alteration in the system, producing Bile, Indigestion, Flatulency, Liver complaints, and such like disorders. These Pills may be taken without danger, requiring no restraint from business or pleasure; they act mildly on the Bowels, causing neither pain, nor griping, and thus remove the complaints; at the same time they strengthen the Stomach, give a healthy action to the Liver, brace the nerves, and invigorate the constitution.—Sold by all Druggists; and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

KNOW THYSELF!—Professor BLENKINSOP continues to receive from individuals of every rank the most flattering testimonials of his success in describing the CHARACTERS of Persons from their HANDWRITING, pointing out their mental and moral qualities, whether good or bad.—Address by letter, stating age, sex, and profession, inclosing 13 uncut postage stamps, to Dr. BLENKINSOP, 344, Strand, London.

WANTED TO PURCHASE, 10 brace of LIVE HARES and 10 brace of LIVE PHEASANTS.—Address A. B., Post Office, Kelvedon, Essex.

WANTED, to Rent, a FARM, within 10 miles of London, of about 200 acres, 150 to consist of Arable, and 50 Grass Land.—Address Mr. LAURENCE, Seedsman, 18, Piccadilly, London.

IRELAND, COUNTY OF KILDARE.

TO BE LET, a FARM, containing 191 acres, statute measure, within two miles of the town of Athy; there are excellent Offices on the Farm, and a Bullock House for feeding 25 head of cattle. The Land is well adapted for tillage, especially Green Crops. There are now about 20 acres prepared for Turnips and Potatoes. The manure will be given at a valuation, as also about 200 barrels of Oats. The railroad from Dublin to Carlow runs through the centre of the land, the station being about one mile from the farm, and the river Banow, which is navigable to Dublin and Ross, about half a mile.—For particulars apply to Mr. G. H. KENNY, 7, Upper Ormond Quay, Dublin.

COUNTY OF TIPPERARY.—BARONY OF LOWER ORMOND.

TO BE LET, from the 25th of March, with immediate possession, the following LANDS:—Ballylina, West Farm, containing 140 acres, Irish; Mathew's Farm (part of Ballylina, W.), 62 acres; Castleview Farm, ditto, 105 acres; Lismalin Farm, 190 acres; Ballynahinch Farm, 82 acres. These Farms are on the Estate of Lord Ashtown, and are situated about eight miles from Portumna, to which there is water-carriage; and the nearest station on the Parsonstown Railway, now in progress, will be at about six miles distance.

The Land is suited for tillage under the 4 or 5-course rotation. There are good slated houses on three of these Farms; and any other buildings, which may be reasonably required, will be erected by the landlord. Mr. JAMES EGAN, the Steward, at Sopwell Hall, near Shinrone, will show these Farms.

MARKET GARDEN GROUND.

TO BE LET, within 12 miles of London, adjoining the Great Western Railway and Grand Junction Canal, 16 acres of excellent, well-stocked ground, situate as above, with half a mile of brick wall, 14 feet high, and of south-west aspect, are to be had on lease for such terms as may be agreed on.—Apply to Messrs. BUNTING, St. James's Street; to Mr. TOLLETT, West Drayton; or to Mr. MEEKINS, Dawley Court, Uxbridge. Several promising young Fruit and Currant Trees for sale, on very low terms.

TO NURSERYMEN AND FLORISTS. KILBURN, MIDDLESEX.

TO BE LET OR SOLD, a very eligible piece of GARDEN GROUND, situate at Kilburn, with three excellent Greenhouses standing thereon, containing respectively a Stove and Hot Water Apparatus. Also, two Brick Pits, with 100 Lights and Frames, and 300 dozen Flower Pots and Plants.—For further particulars apply to OCTAVIUS LEEFE, Esq., Solicitor, 9, New Bond Street; or to Mr. SPENCER, House Agent, 13 and 14, Melton Street, Euston Square, London.

GREENHOUSES AND PUBLIC-HOUSE.

To GARDENERS, FLORISTS, AND OTHERS.

TO BE LET, in the immediate neighbourhood of Gravesend, a large Greenhouse, Propagating-house, and a Range of Brick Pits; also a PUBLIC-HOUSE adjoining the same. The Stock of Plants to be taken at a valuation.—Particulars may be obtained of Mr. J. GOULD, 38, Windmill Street, Gravesend, Kent.

A FORTUNE TO BE MADE IN A SHORT TIME.

TO BE SOLD, Three GREENHOUSES and PLANTS (to be taken at a valuation or private contract), with sundry other useful things, Frames, a Pit, a quantity of Stocks, Tools, Mould, Manure; together with House and Fixtures at a low rental. With immediate possession, if required.—For further particulars, apply at No. 6, Alpha Road, Regent's Park.

TO BE SOLD, at Chapel Farm, Eltham, ASH-LEAF KIDNEY and FORTY-FOLD POTATOES for Seed.—H. J. HAMMOND.

PEACOCKS.

TO BE SOLD, a pair of very handsome old Birds, with 4 young ones about six months old, together or separately, at a reasonable rate.—Apply to HENRY DIPNALL, Esq., Greenhill Owslebury, Bishop's Waltham, Hants.

AYLESBURY DUCKS' EGGS.

TO BE SOLD, EGGS warranted from the best selected White Ducks, good shape, bill and legs fine and a good colour, 6*s.* per dozen, including packing. Early application to secure them at the above price is necessary.—Apply to WILLIAM HENRY GREEN, Builder, Walton Street, Aylesbury.

EGGS FOR HATCHING, from Prize Birds of the following varieties:—Buff Cochin China and Coloured Dorking, 9*s.* 6*d.* per doz.; Golden Spangled, Silver Spangled, and Silver Pencilled Hamburghs, 7*s.* 6*d.* per doz., package included. Warranted perfect when packed, which will be carefully executed. Also for sale, price 30*s.*, a well feathered Buff Cochin China Cockerel (Mr. Andrews's celebrated strain), colour and plumage very rich; his sire won first prizes at the late exhibitions at Dorchester, Yeovil, and Salisbury. —Apply to RICHARD GEORGE, Waterson, Dorchester.

EGGS FROM PURE WHITE-FACED SPANISH FOWLS, at 10*s.* per set of 13.—Letters and Post-office orders to be addressed to Mr. JOHN COMPTON, Portchester, Fareham, Hants.

LIGHT BUFF COCHIN CHINA FOWLS' EGGS. —An Amateur having a first-rate stock of Light Buff Cochin China Fowls from Prize Birds, and more eggs than he requires for his own use, is willing to part with a few sittings at a reasonable price—5*s.* 6*d.* per doz., box included.—Address "Chanticleer," Post-office, Farnham, Surrey.

CLEAR YELLOW COCHINS.—Eggs may be had from four pullets of "Sturgeon" blood, running with a cock bred by Mr. Fairlie, all pale yellow birds; 10*s.* per dozen, package included. Eggs from "commended" Spanish birds at the same rate.—E. T. A., Loddon, Norfolk.

TO BE SOLD, BUFF COCHIN CHINA EGGS, from Birds that have taken prizes at the Derby, East Kent, Bristol, Taunton, and Yeovil Poultry Shows, at 1*l.* 1*s.* per dozen; also Partridge Cochin China Eggs, from Birds that have taken prizes at London Summer Meeting, Surrey Gardens' Show in August, Malvern, Yeovil, Honiton, and Torquay Poultry Shows, at 1*l.* 1*s.* per dozen.—Apply to JOHN R. RODBARD, Aldwick Court, Wrington, near Bristol.

COCHIN CHINA POULTRY, ETC. EGGS FROM PRIZE BIRDS.

MR. JOHN FAIRLIE, of Cheveley Park, Newmarket, in reply to the very urgent applications from numerous amateurs, is now prepared to dispose of a limited number of Eggs, from his celebrated prize Cochins, Brahma Pootras, Scotch Bakies, Dorkings, &c., according to the dates of the orders received.

MR. GILBERT, of Grays, Essex, having entered into an arrangement with THOMAS STURGEON, Esq., for the Purchase of the whole of his remaining Stock of COCHIN CHINA Fowls, bred by him in 1853, Gentlemen and Amateurs are informed the Birds are now on Sale. Eggs may be had from the above birds at 20*s.* per dozen.

BROWN-BREASTED RED GAME FOWLS.

TO BE SOLD, a few Eggs from first-rate two-year-old Birds; also two Walks of splendid young Birds, from the first strain in the country.—For price, &c., apply to Jos. ALLEN, Ampthill, Beds.

TO POULTRY FANCIERS.—Gentlemen wishing to improve their stock of Buff Cochin Chinas have an opportunity rarely offered of purchasing some truly splendid Birds. Bred exclusively from a pair of Thos. Sturgeon, Esq's., best Birds, the Hen weighing nearly 10 lbs., and remarkably heavily feathered. All the Birds now offered are of great weight, and exceedingly heavily feathered, and short thick legs.—May be viewed on application to A. HORNCASTLE, Grays, Essex. Eggs at 20*s.* per dozen. All communications to enclose a stamped envelope.

Sales by Auction.

FANCY POULTRY.

MR. J. C. STEVENS'S next periodical Sale by Auction will take place on TUESDAY, 7th March, at 12 o'clock precisely, at his Great Room, 38, King Street, Covent Garden. The BRAHMA POOTRAS are many of them very choice, and include a Hen, first prize Metropolitan last January. The COCHINS and COLOURED DORKINGS are also well deserving attention, the contributors being H. Gilbert, Esq. Rev. Mr. Papillon, Mr. Gibbs, Mr. Collinson, and several othe first-class breeders.—Catalogues by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

MR. CYRUS CLARK'S CHOICE FANCY POULTRY. EXTRA SALE.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, March 14, at 12 o'clock precisely, a selection from the yard of Mr. Cyrus Clark, of Street, Glastonbury; it includes COCHINS, chiefly light pure Sturgeon and Andrews. The Whites, from Mrs. Herbert's stock. Spanish, Silver Polands, and coloured Dorkings, many of which are prize birds at Dorchester, Yeovil, Bristol, Taunton, Torquay, Honiton, and the Surrey Zoological. —Catalogues, by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden, London.

WOOLWICH.

MESSRS. PROTHEROE AND MORRIS are directed by the Widow of the late Mr. Henry Ward, to offer to public competition, by Auction, on the Premises, Bull Fields, Woolwich, on MONDAY, March 6, at 11 o'clock, the whole of his costly and justly celebrated STOCK of CARNATIONS and PICOTEES, comprising all the first flowers in cultivation.—May be viewed prior to the Sale. Catalogues may be had on the Premises; of the principal Seedsmen in London, and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to public competition by Auction, at the Mart, Bartholomew Lane, on THURSDAY, March 9, at 12 o'clock, about 200 choice DOUBLE CAMELLIAS, from 18 inches to 5 feet, comprising all the approved kinds, beautifully furnished with bloom buds; 100 very strong Camellia Stocks; also a choice assortment of Standard and Dwarf Roses, consisting of Noisettes, Hybrids, Bourbons, Perpetuals, Chinas, &c.; a fine collection of American Plants, choice Dahlias in dry roots, Pæonias, Verbenas, Fuchsias, &c.—May be viewed the morning of Sale. Catalogues may be had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

SLOUGH.

MESSRS. PROTHEROE AND MORRIS have received instructions from Mr. Bragg to submit to unreserved sale by Auction, on the Premises, Star Nursery, Slough, on WEDNESDAY, March 8, at 11 o'clock, his entire collection of CARNATIONS and PICOTEES, consisting of all the leading sorts; also collections of Pinks, Pansies, Hollyhocks, specimen and other Pelargoniums, Cinerarias, Tree Carnations, &c., Standard and other Roses, together with a quantity of Pot and Ground Roots of Dahlias, which will include all the new and most approved varieties.—May be viewed prior to the sale; Catalogues may be had (6*d.* each, returnable to purchasers), on the Premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

N. B. The above Nursery, with the established Business, to be Let, at a moderate rent, apply to Mr. W. BRAGG, on the premises.

MPORTANT AND ABSOLUTE SALE OF MAGNIFICENT SPECIMEN PLANTS.

MESSRS. PROTHEROE AND MORRIS are instructed by J. M. Yeeles, Esq., of Bathford, near Bath, to submit to public competition by Auction, without reserve, on the premises, on WEDNESDAY, March 22d, at 11 o'clock, in consequence of his declining their cultivation, the whole of his unrivalled collection of SPECIMEN, ORCHID, STOVE, and GREENHOUSE PLANTS, many of which are not equalled in this country as splendid examples of superior culture, and just in condition for the coming season's exhibitions. They comprise Saccolabium, Dendrobium, Ixora, Gardenia, Franciscea, Allamanda, Echites, the best kinds of Ericas, Azaleas, Ixoras, Leschenaultias, Boronias, Pimeleas, Aphelexes, Eriostemons, and almost every kind of exotic plant worth culture for exhibition.—May be viewed two days prior to the Sale; Catalogues may be had 6*d.* each, returnable to purchasers, on the premises; the Castle and Ball, the Greyhound, of the principal Seedsmen in Bath; Messrs. Garraway and Mayes, Nurserymen, Bristol; of Mr. Glendinning, Chiswick Nursery, Turnham Green; the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

BRIXTON, SURREY.

To NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS are directed by Mr. Denyer to Sell by Auction on the premises, Loughborough Nursery, Loughborough Road, Brixton, on MONDAY, March 13, 1854, and following days, at 11 o'clock each day, in consequence of the lease expiring at Lady-day next (unless previously disposed of by private contract), the whole of the valuable NURSERY STOCK of Evergreens, Deciduous Shrubs, and Fruit Trees, comprising Fine Variegated and Green Holly, Box, Yew, Chinese Arbor-vitæ, Aucuba, Portugal and Common Laurels, Sweet Bay, Laurestinus, Arbutus, Rhododendrons, Standard and Dwarf Roses, Jasminum, Pyrus japonica, Clematis, Honeysuckle, Magnolia grandiflora, Gum Cistus, &c., in pots; quantity of Box Edging, Standard and Dwarf Trained Apples, Pears, Peach, Nectarine, Cherry, Plums, Vines. Also, GREENHOUSE PLANTS, consisting of a fine Collection of Roses, Camellias, several Thousands of Bedding Plants, Intermediate Stocks, Cloves, &c.; together with five newly erected Greenhouses, several 2 and 3-light Boxes, Hot-water Pipe, two Conical Boilers, quantity of Bricks, Paving Tiles, excellent Tumbril, and two Light Carts; six Nests of Seed Drawers, Shop Fixtures, Scales and Weights, Rotten Manure, Mould, Garden Pots, and other sundry effects.—May be viewed prior to the Sale. Catalogues had (6*d.* each, returnable to purchasers) on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

HUNTINGDON.

To NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.

IMPORTANT SALE OF NURSERY STOCK.

G. M. FOX will Sell by Auction on TUESDAY, March 14, and following days, 10,000 FRUIT TREES (now growing in the George Lane Nursery, Huntingdon, being one of the Nursery Grounds occupied by Messrs. Wood & Ingram, which is obliged to be cleared immediately, the land being required for building purposes), consisting of choice sorts of Apples, Pears, Plums, Cherries, Peaches, Nectarines, and Apricots; 8000 choice GOOSEBERRIES and CURRANTS, 7000 English and Huntingdon ELMS, 2000 ROSES, and a large quantity of Forest and Ornamental Trees, Evergreens, and Flowering Shrubs. The Nursery Ground is within five minutes' walk of the Great Northern and Eastern Counties Railway Stations.—Catalogues, with full particulars, will be ready 10 days before the Sale, and may be had of Messrs. HURST & M'MULLEN, 6, Leadenhall Street; the Office of the Journal of Auctions, 29, Essex Street, Strand, London; the principal Inns in the neighbourhood, and of the Auctioneer, Huntingdon; or will be forwarded on the receipt of four postage stamps.

Messrs. Wood & Ingram's business will be conducted as usual, at their other Nursery Grounds in Huntingdon.

AGRICULTURAL SEEDS.

(CARRIAGE FREE.)

SUTTON AND SONS, SEED GROWERS, Reading, Berks, *have a large Stock of Home Grown Seeds of all the best varieties of Turnips, Magnold Wurzel, Carrot, Clovers, Natural Grasses, &c., which they are now sending out at the lowest market prices.*

In consequence of an unusual press of business at this season, we have been unable to present our friends with a full descriptive catalogue of our Agricultural Seeds, but a *priced* list of the leading kinds were published by us *in the last page of the Gardeners' Chronicle of January 28, all of which articles can still be supplied, as also all other approved kinds of Agricultural Seeds. We shall also be happy to make special contracts for extra large quantities.*

All orders faithfully executed in strict rotation, according to priority of our receiving them.

SUTTON & SONS, Seed Growers, Reading, Berks.

ITALIAN RYE GRASS, Imported Seed.

Per Bushel, 7*s*.

"Too much cannot be said in favour of this very excellent Rye-grass. Compared with any other of the varieties of common Rye-grass, the Italian affords a stronger braird, arrives sooner at maturity, has a greater abundance of foliage and of a lighter, and more lively green colour, grows considerably taller, and is more upright, or less inclined to spread on the ground. Another of its distinguishing characteristics is, that it is much preferred by cattle to any of the common sorts, and is greedily eaten by them, whether green or dry." Imported seed is very much superior to that saved in this country. Three bushels is the quantity usually sown to the acre. We have a good stock of imported Seed, and can recommend it as being of excellent quality.—J. C. WHEELER and SON, Nurserymen, Gloucester Seedsmen to the Gloucestershire Agricultural Society.

FLOWER SEEDS.—We have selected out of our large collection of Flower Seeds the most beautiful and showy varieties, each sort distinct in colour, and calculated to produce a fine effect when planted out in beds or groups in the flower border; and we have had each variety distinctly marked with its Botanical and English name, height, time of flowering, colour of the flower, manner of growing, whether erect or trailing, &c., the time it should be sown, and other valuable hints as to its cultivation. In selecting these varieties, we have been careful to exclude all which are shy bloomers, or have an insignificant appearance, so that the collections will comprise only those which are really showy and handsome, and which we believe would prove to the entire satisfaction of any lady or gentleman who might be disposed to order them. The German Stocks and Asters especially are most superb. The Collections will be sent free by post to any part of the kingdom at the following prices:—

Twenty extra fine varieties, all distinct and beautiful, 5*s*.
Fifty ditto ditto 10*s*. 6*d*.

Payment can be made either by Postage Stamps or Post Office Order, made payable to J. C. WHEELER & SON, Nurserymen, Gloucester.

WILLIAM NICHOLSON still continues to send out very strong well-rooted Plants of his four new and distinct varieties of STRAWBERRIES, viz., AJAX, dessert Fruit; RUBY, ditto; CAPTAIN COOK, Market Fruit; FILLBASKET, ditto, at 15*s*. per 100, or 25 each of any two sorts for 10*s*., box included. Post-office orders payable at Yarm, Yorkshire. For a full description, see Advertisement *Gardeners' Chronicle* Jan. 28, 1854.—Eggle-cliffe, near Yarm, Yorkshire.

HIGHGATE NURSERIES, NEAR LONDON.

JAMES CUTBUSH, with deep regret, begs to inform his Customers and the Public generally of the sudden and lamented death of his Father (WILLIAM CUTBUSH), and offers his sincere thanks for the kind and extensive Patronage he received for upwards of 33 years. J. C. also acquaints them that the business will be conducted as hitherto under the name of "WM. CUTBUSH & SON" by himself, and humbly solicits a continuance of their esteemed favours; and by unremitting attention hopes to merit their support and recommendation.

AMERICAN PLANTS.

JOHN WATERER begs to announce that his NEW CATALOGUE of RHODODENDRONS, AZALEAS, CONIFEROUS PLANTS, &c., is now published, and may be had by enclosing two stamps for postage.

The colours of all the Rhododendrons worthy of cultivation are described in order to facilitate purchasers in making selections, together with a Treatise on their successful management.

☞ The Rhododendrons forming the American Exhibitions in the Royal Botanic Society's Garden, Regent's Park, London, are annually supplied from this establishment.

The American Nursery, Bagshot, Surrey, near the Farnborough Station, South-Western Railway, and 3 miles from Blackwater, South-Eastern Railway.

GEORGE BAKER begs to say that his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, CONIFERS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES, &c., may be had by enclosing two postage stamps.

G. B. wishes to call particular attention to his fine Stock of GREEN and WEEPING HOLLIES, from 1 to 12 feet high.

G. B. has supplied the American Exhibition in the Royal Botanic Gardens, Regent's Park, from its commencement.

American Nursery, Windlesham, near Bagshot, Surrey, about six miles from Staines Station; Windsor Branch, South-Western Railway, where conveyances may be obtained.

CAPE HEATHS.

W. J. EPPS begs to call attention to his extensive and rare Collection of Heaths, which are in the finest condition possible; very bushy and well formed for specimens in No. 3, 4, and 6-inch pots, consisting of all the best varieties, such as Aristata ampullacea, tricolor, jasminiflora, ventricosa, Massoni, Webbiana, obbata, &c., &c., 12*s*., 18*s*. and 21*s*. per doz. A Collection of 100 varieties, 5*l*., carriage paid to London. A liberal allowance to the Trade, provided a quantity be taken. All the new and best kinds of Azaleas, Stove and Greenhouse Plants, Fuchsias, Dahlias, Verbenas, and Roses, equally moderate.

W. J. E. has about 200 young specimens of Heath, &c., to part with in No. 8, 11, and 20-inch pots. Also a Collection of very beautiful Orchids. Lists sent on application.

Nurseries, Maidstone and Ashford.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, &c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidence, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introduced by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant bloomer; and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21*s*.

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gaufred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes. Each 21*s*.

HIMALAYA CEDAR.

MAULE AND SONS beg to intimate to Noblemen and Gentlemen engaged in Forest or Ornamental Planting that they still hold large supplies of this universally admired and fine timber tree, which they are sending out at the below quotations.

CEDRUS DEODARA, 2 years, fine,	25*s*. per 100,	10*l*. per 1000
" " *1 foot ...	5*l*. "	
" " *1 to 2 feet ...	7*l*. 10*s*. "	
" " *2 to 3 feet ...	42*s*. per doz.,	15*l*. per 100
" " **3½ to 4 feet ..	60*s*. "	25*l*. "
" " **4 to 4½ ft., extra fine, for Avenues and single planting	80*s*. "	30*l*. "

☞ Those marked * are grown in suitable sized pots; those marked ** may be had either in pots or from the open ground.

Large supplies of Taxodiums, Cryptomerias, Pinus excelsa, Abies Smithiana, Cupressus Goveniana, Lambertiana, &c. &c., offered at such prices as will admit of their introduction into mixed forest and other plantations. Terms sent on application.

The Nurseries, Bristol, March 4.

PERUVIAN SKINLESS BARLEY.—SEED of this valuable variety, weighing 60 lbs. per bushel, may now be obtained of Messrs. CASH & Co., Oil and Seed Merchants, Coventry. Price 7*s*. 6*d*. per bushel. Orders must be accompanied by a remittance. The quantity on hand being small, immediate application will be necessary.

THE BEST DESCRIPTIVE SEED LIST

YET PUBLISHED IS THAT OF

RICHARD SMITH, NURSERYMAN and SEEDSMAN, Worcester, *of whom it may be had Gratis on application; it contains full particulars of his COLLECTIONS of SEEDS.*

		£.	*s*.	*d*.

Any alterations of equal value that may be wished in the sorts or quantities intended for these Collections will be willingly made.

A DESCRIPTIVE PRICED LIST OF ROSES for 1854 gratis.

WHEELER'S SHORT SELECT SEED LIST.

J. C. WHEELER AND SON'S SEED LIST *is now ready, and will be forwarded free on application. We have tried to make it as short and as select as possible, leaving out all inferior varieties, so that it is really a List of the best Seeds in cultivation. Grasses and other Agricultural Seeds, Garden and Flower Seeds, all described, and prices put to every article. We deliver our Seeds Carriage Free to almost every Railway Station in the kingdom, and take especial care that every sort we send out is true to name, and of the best quality.*

J. C. WHEELER & SON, Seed Merchants, Gloucester.

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY FOR 1854.—*The opinions of the following gentlemen, well known in the Horticultural world, will be found in the back page of the* GARDENERS' CHRONICLE *of February* 18:—

Mr. JAMES BARNES, the well-known Gardener to the Right Honourable Lady Rolle, Bicton.

Mr. W. TILLERY, Gardener to his Grace the Duke of Portland, Welbeck.

The Editor of the "Midland Florist and Suburban Horticulturist."

The Editor of the "Mark Lane Express."

Mr. GEORGE GLENNY, the Editor of the "Quarterly Review of Horticulture," the Gardening department of *Lloyd's Weekly Newspaper*, and several other periodicals.

The Editor of the *Lady's Newspaper and Pictorial Times*.

The Editor of the "Florist, Fruitist, and Garden Miscellany."

Mr. WILLIAM OGSTON, Brentwood, Essex.

Mr. HAMILTON, the well-known Author of the "Hamiltonian System of Pine Culture."

Mr. JENNINGS, Head Gardener to the Right Honourable the Earl of Derby, Knowsley Hall, Prescot.

Mr. D. BEATON, Surbiton, Kingston, Surrey, one of the most popular Horticultural writers of the day.

Mr. CHARLES M'INTOSH, Dalkeith Park, Editor of the "Book of the Garden," the most sterling work on gardening extant.

The Editor of the "Southern Florist."

It has also been favourably noticed by the following Newspapers and Magazines:—"The Cottage Gardener," "The Gardener's and Farmer's Journal," "The Agricultural Magazine," "The Plough," "Plymouth Herald," "Exeter Gazette," "Bristol Mercury," "Western Luminary," "Somerset County Herald," "The Clerical Journal," "Cornish Telegraph," "Plymouth Mail," "Devonport Telegraph," "Somerset Gazette," "Western Courier," "Teigumouth Gazette," "West Briton," "Portsmouth Times," "Naval Gazette," "Stockport Advertiser," "Liverpool Advertiser," and several other Newspapers and Magazines.

RENDLE'S PRICE CURRENT.—*The following has been received to-day from a Clergyman in Buckinghamshire, dated March* 1*st*, 1854:

"Thinking I might be of service to you, I have distributed the several Garden Catalogues you sent me. I should be obliged to you to send me some for my own use. Nothing can be more convenient to refer to in *every way*. The trouble and care in getting it up must have been very great, and it is to be hoped the reward will be commensurate. *Nothing is so easy as to find fault.* Please send me the 'Farm Directory,' which I see is just published."

RENDLE'S PRICE CURRENT.—In addition to the large number of testimonials in favour of this publication already announced in this Paper, the Proprietors have also the pleasure of announcing several more—from Ben. Maund, Esq., of Bromsgrove; from Dr. Brindley, of Chester; from the Editor of the *Derby Mercury*, from the Editor of the *Farmers' Journal*, from Mr. Lynch, Head Gardener to the Lord-Lieutenant of Ireland; from Mr. Snow, Head Gardener to the Earl of Morley; from Mr. Millray, Head Gerdener to the Baroness de Sternberg, &c. &c.

SUTTON'S GRASS SEEDS.—EXTRACT OF A LETTER FROM DR. LINDLEY:—

"Messrs. SUTTON,—*We have already made a trial of your Lawn Grass Seeds, and it is but justice to say they have proved the best we have sown for many years.*

(*Signed*) "JOHN LINDLEY.

"*Horticultural Society*, 21, *Regent Street, London, Nov.* 9, 1853."

Messrs. SUTTON are continually receiving similar letters of commendation of their Lawn Grass Seeds. Price of seed, 1*s*. 3*d*. per lb., 3*s*. per gallon, or 21*s*. per bushel, CARRIAGE FREE, except very small quantities. The quantity required is 40 lbs. per acre, in forming new lawns, or from 10 to 20 lbs. per acre for improving old lawns.

SUTTON'S Grass Seeds for forming Permanent Pasture, 24*s*. to 30*s*. per acre; SUTTON'S Renovating Mixture for Improving Old Pastures, 1*s*. per lb.

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

SPLENDID NEW SHRUBBY CALCEOLARIAS.

MR. HENRY MAJOR, Knosthorpe, near Leeds, begs to announce that his Descriptive List of Beautiful New Seedling Shrubby Calceolarias is now ready, and may be had on pre-paid application. Very choice Calceolaria Seed, 2*s*. 6*d*. per Packet.—March 4.

BEAUTIFUL FLOWERS.

50 Varieties of Flower Seeds ...	... ...	6*d*. per oz.
30 Varieties of Beautiful Sorts	... ...	1*s*. "
50 Varieties in half-quarter ounce packets	...	4*s*.
30 Varieties in packets...	... ...	3*s*.

Any kind, in 1*d*. and 2*d*. packets sent free by post upon receipt of a stamped directed envelope. Vegetable Seeds of all kinds, Shrubs, Flowers, &c., at Mr. CULLINGFORD'S, 1, Edmund Terrace, Ball's-pond Road, Islington, London.

EDWARD GEORGE HENDERSON AND SON beg to inform their Patrons and the Public that their Catalogue of Seeds for 1854 is now ready, and will be forwarded post free on application.

E. G. H. & SON take this opportunity of stating that none but the most popular and improved kinds of Vegetable Seeds appear in their List; and among the Flower Seeds only those whose beauty and merit are universally acknowledged, together with a carefully selected stock of the principal new varieties.

E. G. H. & SON beg respectfully to call particular attention to the following choice Seeds of Florist Flowers, which have been saved from a fine collection of named sorts, and also the annexed new Annuals, which they can confidently recommend.

Digitalis, new spotted varieties, extra fine ...	0	6

Wellington Nursery, St. John's Wood, London, March 4.

GUTTA PERCHA HORTICULTURAL LABELS —These Labels are admirably adapted for Roses, Shrubs, Trees, and Herbaceous Plants. They are of sheet Gutta Percha, 3½ inches wide and 1 inch deep, the name indented in bold letter, and surrounded by a neat border. Being of a dark brown colour, they are an advantageous substitute for the unsightly labels of parchment, painted wood, or zinc, over which they possess the advantage of showing the name distinctly and of being imperishable.

"What is wanted in a Garden Label is durability, legibility, and cheapness; and this (the Gutta Percha Label) seems to approach such requisites nearer than any we have yet seen."—*Gardeners' Chronicle.*

Price 8*d*. per dozen. By post, free, 1*s*. per dozen.—Sold by E. TAYLOR, Gutta Percha Warehouse, Colchester.

EMIGRANTS' IRON AND WOOD HOUSES from 10*l*. each; Drawings of 21 Houses sent free. Also maker of Iron and Wood Summer Houses for Gardens. Portable Poultry Houses, Pheasantries, &c.—R. RICHARDSON, 21, Tonbridge Place, New Road, near King's Cross, London.

SUBSTITUTE FOR GARDEN MATS.—Waxed Sheeting nearly 2 yards wide, 1*s*. per yard run—admits light and excludes cold; Thick Canvass Tarpauling, 1*s*. per square yard; Thick Canvass Waxed Sheeting, 1*s*. per square yard, may be had various widths; these Canvasses are excellent for Roofing Sheds and Outhouses, as they are quite Waterproof.

R. RICHARDSON, 21, Tonbridge Place, Judd Street, New Road, London.

LAND DRAINAGE.

MR. JOHNSON begs to inform Landowners, Agents, &c., that he is prepared to undertake the Drainage of Land, either by Contract or by a small charge per acre for planning and setting out the Drains, taking Levels, superintending the Work, &c.

Mr. J. has been for several years constantly employed as a Drainer in most of the Counties in England, and can give numerous satisfactory references. Plans for Tilery Buildings, and every information on Drainage can be obtained at the Office, 12, Abingdon Street, Westminster.

LAND DRAINAGE.

MR. BAILEY DENTON'S TABLES OF COST, &c., price 1*s*. 4*d*. Sold by METCHIM, Parliament Street.

MR. BAILEY DENTON'S WORKMAN'S A LEVEL, price 1*l*. 10*s*. Sold by JONES & Co., High Holborn, London.

PLAN OF DRAINS.—It being essential in all cases after Draining to preserve a correct Plan and Record of the work, J. JOHNSON begs to intimate that he is prepared to make Surveys and accurate Plans (to any scale) of Field Drainage, for a charge varying from 6*d*. to 18*d*. per acre.—Address, 12, Abingdon Street, Westminster, London.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church Row, Stoke Newington, both in the County of Middlesex, Printers, at their Office, in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, MARCH 4, 1854.

21, REGENT STREET.

HORTICULTURAL SOCIETY OF LONDON.
PRIVILEGED TICKETS.

The Exhibitions will take place on the Second Saturdays in May, June, and July, namely—

MAY 13, JUNE 10, JULY 8.

All Fellows who shall apply, on or before Tuesday the 25th of April, may obtain, at the rate of Three Shillings and Sixpence each, any number of Tickets NOT EXCEEDING THIRTY-SIX; but no application for such tickets will be received after that day. *Fellows of the Society subscribing for tickets at this price will be allowed a clear week from the 25th of April during which they may claim them.* AFTER THAT PERIOD ALL THE 3s. 6d. TICKETS SUBSCRIBED FOR, BUT NOT ISSUED, MAY BE CANCELLED.

After the 25th of April, any further number of tickets will be delivered to Fellows on their personal application or written order, at the price of *Five Shillings* each ticket.

SPECIAL PRIVILEGE OF FELLOWS.—Fellows of the Society enter free at half-past 12, and can introduce TWO friends WITH TICKETS; or the Fellow's privilege may be transferred to a brother, sister, son, daughter, father, mother, or wife, residing in the Fellow's house, provided the person to whom the transfer is made be also furnished with a ticket signed by that Fellow. That is to say, the privilege of entering early may be transferred, but not the privilege of FREE admission.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—
The days appointed for the EXHIBITIONS of PLANTS, FLOWERS, and FRUIT this year are WEDNESDAYS, May 24, June 21, and July 5; and AMERICAN PLANTS, MONDAYS, June 12 and 19.

Tickets of Admission are now being issued, and can be obtained at the Gardens by orders from Fellows of the Society. Price on or before May 13, 4s.; after that day, 5s. each. The Plants will be arranged on a new plan, similar in form to the American Garden.

SOUTH LONDON SOCIETY OF AMATEUR
FLORISTS.—The EXHIBITIONS for the present season will take place at the HORNS TAVERN, KENNINGTON, on WEDNESDAY, April 26th, 1854, for Auriculas, Polyanthuses, Heartsease, &c.; THURSDAY, May 25th, for Tulips, &c.; THURSDAY, June 22d, for Pinks, Roses, Ranunculuses, &c.; WEDNESDAY, July 26th, for Carnations, Picotees, Verbenas, Fuchsias, &c.; FRIDAY, September 15th, for Dahlias, Hollyhocks, &c.; and WEDNESDAY, November 22d, for Chrysanthemums, &c. Amateurs and others wishing to subscribe to this Society, are requested to send immediate notice to one of the undersigned Secretaries, WM. TRAHAR, Esq., 5, Kensington Gore; JOHN BUSHELL, Esq., Lower Kennington Lane; or to the "Horns Tavern," Kennington.

COUNTY of GLOUCESTER and CHELTENHAM
ROYAL HORTICULTURAL SOCIETY.—The Committee of Management of the above Society, finding that their funds are in a more prosperous condition than they had anticipated, have determined to increase the amount of Prizes to be given at their Shows on the 3d May and 30th August next. The amended Schedule may be had on application at the offices of the Society. HENRY J. COCHRANE, Secretary.

Committee Room, 128, High Street, Cheltenham.

JOSEPH FAIRBAIRN deceased.—All persons having
CLAIMS upon the ESTATE of Mr. JOSEPH FAIRBAIRN, late of Clapham, Nurseryman and Seedsman, deceased, are requested to forward full particulars thereof forthwith to EDWARDS & FRANKISH, Solicitors, 11, New Palace Yard, London.

JOHN JEYES, NURSERYMAN, Northampton, has to
offer fine dwarf-trained trees of the following fruits:—

MORELLO, and other Cherries; MOOR PARK APRICOTS; GREENGAGE, and other Plums.

NEW CUCUMBER.

MARSHALL'S "IMPROVED JEWESS,"
a hybrid between the Brewston and Mills's Jewess. It is a good bearer, dark green, black spine, a first-rate variety for early forcing and general crop. Seeds may be obtained of Mr. MARSHALL, Gardener to John Sick, Esq., Chiswick, Middlesex. A packet of five seeds, 2s. 6d.

NEW PLUMS.

HENRY DOWLING, FRUIT-GROWER, Woolston
Lawn, Southampton, most respectfully begs to return his sincere thanks to the Nobility, Gentry, and Public generally, for the most liberal patronage he has received, and informs them that he has none of the Standard of England, but can supply good strong plants of the Angelina Burdett and Black Gage, which can be obtained at Mr. C. TURNER'S, Royal Nursery, Slough, or from the Grower. See the *Florist* for December, or *Gardeners' Chronicle* of November 5th or 12th for testimonials and particulars.

Woolston Lawn, March 11 1854.

GRASS SEEDS FOR PERMANENT PASTURE.

WHEELER AND SON'S DESCRIPTIVE LIST
of GRASS SEEDS will be forwarded free on application.
J. C. WHEELER AND SON, GLOUCESTER.

A FIRST CLASS CATALOGUE OF GERANIUMS, VERBENAS, FUCHSIAS, DAHLIAS, HOLLYHOCKS, ETC.

GEO. SMITH begs to announce that the above is
now ready and will be forwarded in exchange for one postage stamp.—Tollington Nursery, Hornsey Road, Islington.

N. GAINES begs to announce his List of Dahlias
and Pelargoniums for 1854 is now ready. It contains a description of his three Seedling Dahlias to be sent out in May, viz., Alba superba, Primrose Perfection, and King of the Yellows. Also a Printed List of Fuchsias, Cinerarias, Chrysanthemums, Auriculas, Corræas, Verbenas, Camellias, Azaleas, Rhododendrons, &c., &c., may be had post free on application.
Nursery, Surrey Lane, Battersea.

GRASS SEEDS, SEPARATE OR MIXED.

GENTLEMEN *intending to lay down land to Permanent Pasture, or for one or two years' lay, are recommended to communicate with us, stating the nature of the soil and situation, that we may advise as to sorts of Grass Seeds most suitable.* Price 24s. to 32s. per acre.
JOHN SUTTON & SONS, SEED GROWERS, Reading, Berks.

Classes; Seed saved by Mr. GLENNY from flowers three inches across: the six, 37 stamps; Mixed Seeds, 13 stamps, in Sealed Packets only, signed and sealed. The finest seeds that can be had procured to order, and all other choice Horticultural subjects.—420, Strand.

SUTTON'S GRASS SEEDS.—
EXTRACT OF A LETTER FROM DR. LINDLEY:—

"MESSRS. SUTTON,—*We have already made a trial of your Lawn Grass Seeds, and it is but justice to say they have proved the best we have sown for many years.*

(Signed) "JOHN LINDLEY.

"*Horticultural Society*, 21, *Regent Street, London, Nov.* 9, 1853."

Messrs. SUTTON are continually receiving similar letters of commendation of their Lawn Grass Seeds. Price of seed, 1s. 3d. per lb., 3s. per gallon, or 21s. per bushel, CARRIAGE FREE, except very small quantities. The quantity required is 40 lbs. per acre, in forming new lawns, or from 10 to 20 lbs. per acre for improving old lawns.

SUTTON'S Grass Seeds for forming Permanent Pasture, 24s. to 30s. per acre; SUTTON'S Renovating Mixture for Improving Old Pastures, 1s. per lb.

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

SUPERB SEEDLING POTENTILLAS
RAISED BY BASS AND BROWN.

"This fine Perennial is not grown a tithe of what it should be."—*G. Glenny.*

We have the pleasure to offer the following very beautiful Potentillas, which we have selected from a large and much admired batch of Seedlings. We intend to send them out in May, and all orders are recommended to be forwarded early, as the stock of some of them may run short. We quote as under several authorities to whom they have been submitted for opinion:—

"All are very handsome kinds, and well worthy of cultivation."—*Gardeners' Chronicle*, July 3, 1852.

"We see no reason to alter our opinion formerly given of your Seedlings; they are certainly all very fine."—*Gardeners' Chronicle*, July 16, 1853.

"The whole appear bright, and many of them novel. They would make a pretty collection of a very pretty perennial, which from this batch of Seedlings seems to be going a-head."—*G. Glenny*, July 17, 1853.

"A very interesting collection of this useful hardy plant in great variety of colours, many of them being quite new and beautifully varied."—*Turner's Florist*, Sept. 1, 1853.

"We were not aware until we received specimens of these that there were so many beautiful varieties at the command of the gardener. All very rich and fine."—*Cottage Gardener*, July 28, 1853.

A letter from Mr. C. Turner, of July 29, states, "Your Potentillas are exceedingly fine and beautiful."

KING OF CRIMSONS, rich bright blood red, very large, and of dwarf habit ... ... 10*s.* 6*d.*

"Decidedly the most striking is No. 21, a deep scarlet crimson."—*Gardeners' Chronicle*, July 3, 1852.

"All very fine, more especially No. 21, which measures about 2 inches in diameter."—*Gardeners' Chronicle*, July 16, 1853.

"Deep blood, very large."—*Cottage Gardener*, July 28, 1853.

"Immensely large, bright blood, rich in texture, and above the average form."—*G. Glenny*, July 2, 1853.

THEODORE, a fine yellow, richly spotted, and shaded with bright red ... ... 7*s.* 6*d.*

"A good orange yellow, tipped."—*Gardeners' Chronicle*, July 16, 1853.

George Glenny, in selecting it as one of the finest, describes it as "yellow, shaded with bright red."

JULIA, a fine large primrose yellow ... ... 7*s.* 6*d.*

The Editor of the "Cottage Gardener" in selecting this from many others as one of the finest, describes it as "a very pale clear yellow."—July 28, 1853.

SUDBURY GEM, a rich orange yellow, deeply shaded and spotted with bright red ... ... 10*s.* 6*d.*

"A very beautiful variety, orange, veined upwards from the base with crimson."—*Cottage Gardener*, July 28, 1853.

SHYLOCK, a very rich dark velvet maroon, large, fine, and attractive ... ... 10*s.* 6*d.*

"Rich and dark."—*George Glenny*, July 17, 1853.

The set for 42*s. The usual allowance to the trade by taking two or more sets.*

The following SEEDLINGS are also very fine, rich, and showy:

FLORAL BEAUTY, a rich scarlet, dark centre ...	3*s.*	6*d.*
NAPOLEON, blood red, dark centre	2	0
DEFIANCE, rich dark crimson	2	0
NEGRESS, rich dark velvet maroon	3	6
SCARLET GEM, bright scarlet, black centre ...	3	6
PRIMROSE, a fine large clear yellow...	2	0
ARGO, a fine bright yellow	2	0

This set for 16*s.*

Seed and Horticultural Establishment, Sudbury, Suffolk.

KNAP HILL NURSERY, WOKING, SURREY.

WATERER AND GODFREY, Nephews and Successors to the late HOSEA WATERER, respectfully invite the attention of parties engaged in planting to the following list:—

Araucaria imbricata, 2, 3, 4, 5, and 6 feet high, in the open quarters, regularly removed every year, and as robust and handsome as it is possible to get them. We have a large stock.

Cryptomeria japonica, 2, 3, 4, 5, 6 to 8 feet.

Cedrus Deodara, stout handsome plants from seed, in any quantity, and of all heights from 1 to 7 feet. A few splendid specimens 10 to 15 feet; warranted to transplant with perfect safety.

Cedar of Lebanon, 2, 3, 4, 5, 6, 7 to 10 feet. These large Cedars of Lebanon are also very handsome trees.

Cupressus macrocarpa, or Lambertiana, 2, 3, 4, 5, 6, and 8 feet, all from seed.
" Goveniana, 2 to 3 and 4 feet.
" Funebris, 2 and 3 feet.
" thyoides variegata, 2, 3, and 4 feet.

The Variegated White Cedar, a scarce but most beautiful variegated plant, seldom seen except at Elvaston Castle. We hold a large quantity.

Juniperus Bedfordiana, fine plants, 3, 4, and 5 feet.
" Chinese, 2, 3, 4, 5, 6, 8, and 10 feet.
" repandus, 3, 4, 5, to 8 feet.
" Upright Irish, 3, 4, 5, 6, 7, and 8 feet; perfect columns, and, except at Elvaston, unequalled.
" Virginiana, the Red Cedar, 4, 5, 6, and 8 feet.

Taxodium sempervirens, 2, 3, 4, 5, and 7 feet.

Yew, common, 3, 4, 5, to 8 feet high.
" Irish, 3, 4, 5, to 10 feet. A splendid lot, all being trimmed to one stem; it adds much to their appearance and value.
" Gold striped, 1, 2, and 3 feet.
" do. worked on the Common, with fine heads, 4, 5, 6, and 7 feet high; very handsome.
" elegantissima (new striped) standards. The golden Yews are very ornamental, and we have a large quantity of fine plants.
" Dovaston, or Weeping Yew, fine standards.

Pinus Douglasi, 3, 4, 5 and 7 feet; a few magnificent plants, 10 to 12 feet high.
" insignis, 2, 3, 4, 5, 6, and 7 feet; all from seed.
" cembra, 3, 4, to 6 feet.
" Canadensis (Hemlock Spruce), 3, 4, and 6 feet.
" morinda, 3, 4, and 6 feet.
" Menziesi, 3, 4, 6, and 8 feet.
" cephalonica, 3 to 4 feet.
" Pinsapo, large and handsome, 3 and 4 feet.
" Nordmaniana, from seed, 1½ foot; a few larger, 2 feet.
" nobilis, stout plants, with perfect heads, about 1½ foot; a few larger specimens, 3 and 4 feet. We hold a fine stock of this beautiful Fir, none of which are grafted.

Thuja Arbor-vitæ, American, 3 to 6 feet. We recommend this plant for hedges.
" Weareana, 3 to 6 feet, one of the few really hardy and most useful evergreens.
" aurea. This is perhaps one of the prettiest plants of the day; it was first sent out from this Nursery, and our stock, for size and beauty, is unsurpassed.

Libocedrus chilensis, 1½, 2, and 3 feet. This is a very distinct and beautiful plant, of recent introduction. Our stock is large and good.

Independent of the foregoing we are very large holders of the most useful Evergreens, Deciduous and Ornamental Trees, and of large size. Priced Catalogues will be forwarded on application, enclosing two postage stamps, which will also include a Descriptive Priced Catalogue of the celebrated collection of American Plants grown at this Nursery.

The Nursery is near the Woking Station, and about an hour's ride from London. A visit is earnestly solicited from all who intend planting during the forthcoming season.

NEW AGRICULTURAL ROOT.
SUTTON'S CRUICKSFIELD HYBRID SWEDE.

This is very distinct from the Swede and the Kohl Rabi, but partakes of the nature of each of those valuable roots, from which indeed it has proceeded. It is of the shape and size of Skirving's Swede, but is much hardier, and has the flesh of the Kohl Rabi. Cattle, and especially Sheep, eat it with great avidity, preferring it to Swedes, when both are presented to them. It *may be sown* earlier than Swedes for feeding off early in the Autumn; or it may be sown much later than the Swedes with certainty of success, as it will thrive while young during greater drought than Swedes, and is also found to stand severe frosts, and produce an invaluable crop of early Spring food.

Messrs. SUTTON & SONS, Seed Growers, Reading, Berks, have the honour of introducing the above valuable new root to their Agricultural friends, having purchased the stock of a gentleman in Scotland, who raised it by hybridising, as above stated, and on whose testimony as an Agriculturist they can place the most implicit reliance; and they avail themselves of this early medium of advertising, not so much for the purpose of effecting a large sale, as that it may be distributed in small quantities throughout the kingdom, from which they hope to receive an extensive sale next year. It should be drilled at same distance, and in other respects cultivated as Swedes; but it may also be transplanted if required, to mend a field of Swedes which has partially failed. Quantity of seed required per acre, 3 lbs. to 4 lbs., price 5*s.* per pound. The stock of seed being limited, it will be necessary to send orders early.

Address JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

N.B. We have an excellent Stock of Swede and other Turnip Seeds, Mangold Wurzel, and White Belgian Carrot Seed, &c.

BASS AND BROWN'S SEED AND PLANT LIST
free by post for three penny stamps.

COLLECTIONS OF VEGETABLE SEEDS.

The following comprise the best in cultivation, including several new sorts of first-rate quality:—

No. 1, Collection for a large garden, for one year's supply	£3	0	0

BASS & BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk. ESTABLISHED ABOUT HALF A CENTURY.

WHEELER'S SHORT SELECT SEED LIST.

J. C. WHEELER AND SON'S SEED LIST *is now ready, and will be forwarded free on application. We have tried to make it as short and as select as possible, leaving out all inferior varieties, so that it is really a List of the best Seeds in cultivation. Grasses and other Agricultural Seeds, Garden and Flower Seeds, all described, and prices put to every article. We deliver our Seeds Carriage Free to almost every Railway Station in the kingdom, and take especial care that every sort we send out is true to name, and of the best quality.*

J. C. WHEELER & SON, Seed Merchants, Gloucester.

RENDLE'S NEW FARMING PRICE CURRENT
AND AGRICULTURAL DIRECTORY FOR 1854.

OPINION OF THE EDITOR OF THE "MARK LANE EXPRESS:"—

"We have just seen a copy of this excellent Price Current, and consider it a most valuable companion to the Agriculturist. It is the same size as the garden edition, lately reviewed in this paper. It contains an excellent Almanack, with the University Terms, Eclipses, &c., and a List of Fairs and great Markets held in the four Western Counties. The descriptive lists of Grasses are excellent; they give all the best varieties for permanent pasture, ornamental parks and lawns, sheep walks, heathy and moory lands, &c. Then comes the list of Clover and Turnips, all described in a concise and useful manner. Then follows descriptions of the best Mangold Wurzel, Carrots, and other vegetables used in agriculture; then we have a Price Current of all the best Natural and Artificial Manures, with much useful information relative to Peruvian Guano, Lawes' Patent Superphosphate, Nitrate of Soda, Bone Dust, Bolivian Guano, &c.; then are found some very good advice relative to the purchase of so-called Wheat Manures; but the best Paper is one contributed by J. B. Lawes, Esq., of Rothamsted, 'On the Cultivation of one Green Crop after another on Heavy Land.' This should be read by all engaged in agricultural pursuits. There are some valuable tests for discovering adulterations in manures, by J. C. Nesbit, Esq., the celebrated agricultural chemist; and the report of a lecture by Professor Way on the same subject; then follow the Advertisements, comprising some illustrations of the best implements of the day. It is very well got up, and comprises 52 closely-printed pages, crown quarto size, and we strongly recommend it for the perusal of all engaged in the healthy pursuit of agriculture."

CHARLES ALEXANDER (late of DICKSONS & Co.),

SEEDSMAN and FLORIST, 32, West Register Street, Edinburgh. His Descriptive Catalogue of Select Garden and Flower Seeds is just published, and will be forwarded free on application.

PAGE AND CO., SEED MERCHANTS TO THE AGRI-HORTICULTURAL SOCIETY OF BOMBAY.

SEEDS FOR EXPORTATION (free on board) AND HOME USE (carriage paid).

No. 3.	Do. Do.	1	0	0
No. 1.	A selection of the most beautiful and showy Annuals (case included)	1	5	0
No. 2.	Do. Do. Do. ...	0	15	0
No. 3.	Do. Do. Do. ...	0	10	6

General Priced Catalogues free upon application.

In addition to our great experience, the port of Southampton affords us unrivalled facility for the almost daily shipment of SEEDS to all parts of the world; and as no greater test of genuineness and vitality than a long transit by sea can be applied to Seeds, we yield priority to none in supplying such for home growth as cannot fail to prove most satisfactory.

All parties desirous of taking or sending Seeds to the Peninsula, Mediterranean, East and West Indies, Australia, Brazil, Cape of Good Hope, China, America, &c., are particularly requested to state their wishes to us, whereby the annoyance and disappointment which too frequently happens by placing their orders in the hands of inexperienced persons will be prevented. We are continually receiving the warmest thanks of our consignees; only a few days since, a gentleman writes from Melbourne, "Your Seeds have proved excellent. The selection of Peas has afforded us the greatest delicacy in Australia." From Capt. H. J. Barr, Secretary to the Horticultural Society of Bombay: "Gentlemen,—In acknowledging the receipt of your last supply of Vegetable and Flower Seeds, which reached me on the 8th June by the overland route, I have the honour to inform you that they have all turned out so fresh and good that the demands on our Society have *increased so much* that I must now cancel my former order, and beg you to supply me according to the list now furnished."

PAGE & CO.'S BLIGHT COMPOSITION should be in the hands of all Plant and Fruit Cultivators. For testimonials see back leaf of this day's Paper.

Oxford Street (adjoining Radley's Hotel, 20 yards from the Railway and Docks), Southampton.

ADAMSON'S REGISTERED ORNAMENTAL GARDEN EDGING,

a cheap, durable, and perfect substitute for all other Edgings, for Conservatories, Terrace Walks, or Garden Borders, being of an agreeable colour, a thorough drain for the walks, applicable to borders of any form or size, and does not harbour vermin. To be obtained only of the Inventor and Manufacturer, T. H. ADAMSON, Jun., Builder, High Street, Putney, where Prospectuses may be obtained on application.

May be seen laid down in the Horticultural Society's Gardens, Chiswick, where it has withstood the late severe winter.

GUTTA PERCHA HORTICULTURAL LABELS

—These Labels are admirably adapted for Roses, Shrubs, Trees, and Herbaceous Plants. They are of sheet Gutta Percha, 3¾ inches wide and 1 inch deep, the name indented in bold letter, and surrounded by a neat border. Being of a dark brown colour, they are an advantageous substitute for the unsightly labels of parchment, painted wood, or zinc, over which they possess the advantage of showing the name distinctly and of being imperishable.

"What is wanted in a Garden Label is durability, legibility, and cheapness; and this (the Gutta Percha Label) seems to approach such requisites nearer than any we have yet seen."—*Gardeners' Chronicle.*

Price 8*d.* per dozen. By post, free, 1*s.* per dozen.—Sold by E. TAYLOR, Gutta Percha Warehouse, Colchester.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON and BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40*s.* Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

DILCOCK'S BRIDE BROCCOLI.

BAINBRIDGE AND HEWISON (late Jas. Edward), have the pleasure of again offering to their friends and the public their DILCOCK'S BRIDE BROCCOLI, at 2*s.* 6*d.* per packet; and while returning their thanks to their numerous patrons of last season, they beg to refer them to the following extract, taken from the *Yorkshireman* newspaper of the 30th of April last, when it was exhibited at York, for the fourth time:—"Mr. Dilcock deservedly obtained all the three prizes for Broccoli with his seedling—the 'Bride.' Taking the season into account, these vegetables were really remarkable specimens." It was equally successful the two previous years.

B. & H. are prepared to send out their Catalogues of Kitchen Garden and Flower Seeds, post free, on application, and also their Catalogue of Plants early in March, containing Stove, Greenhouse, &c., including many of the newest and choicest of the season. Their Seeds will be of the very best quality, and in the greatest possible variety.

Sold Wholesale by NOBLE, COOPER, & BOLTON, Fleet Street; CHARLWOOD & CUMMING, Covent Garden; and by all respectable Seedsmen in town and country.—York Nurseries, March 11.

ITALIAN RYE GRASS, Imported Seed.

Per Bushel, 7*s.*

"Too much cannot be said in favour of this very excellent Rye-grass. Compared with any other of the varieties of common Rye-grass, the Italian affords a stronger braird, arrives sooner at maturity, has a greater abundance of foliage and of a lighter, and more lively green colour, grows considerably taller, and is more upright, or less inclined to spread on the ground. Another of its distinguishing characteristics is, that it is much preferred by cattle to any of the common sorts, and is greedily eaten by them, whether green or dry." Imported seed is very much superior to that saved in this country. Three bushels is the quantity usually sown to the acre. We have a good stock of imported Seed, and can recommend it as being of excellent quality.—J. C. WHEELER and SON, Nurserymen, Gloucester, Seedsmen to the Gloucestershire Agricultural Society.

FLOWER SEEDS.—We have selected out of our large collection of Flower Seeds the most beautiful and showy varieties, each sort distinct in colour, and calculated to produce a fine effect when planted out in beds or groups in the flower border; and we have had each variety distinctly marked with its Botanical and English name, height, time of flowering, colour of the flower, manner of growing, whether erect or trailing, &c., the time it should be sown, and other valuable hints as to its cultivation. In selecting these varieties, we have been careful to exclude all which are shy bloomers, or have an insignificant appearance, so that the collections will comprise only those which are really showy and handsome, and which we believe would prove to the entire satisfaction of any lady or gentleman who might be disposed to order them. The German Stocks and Asters especially are most superb. The Collections will be sent free by post to any part of the kingdom at the following prices:—

Twenty extra fine varieties, all distinct and beautiful, 5*s.*
Fifty ditto ditto 10*s.* 6*d.*

Payment can be made either by Postage Stamps or Post Office Order, made payable to J. C. WHEELER & SON, Nurserymen, Gloucester.

MESSRS J. AND H. BROWN offer the following SELECTED PLANTS, FRUIT TREES, &c., which they will forward to any part of the Kingdom or the Continent; and their New Descriptive Catalogues of Plants and Seeds by post.

		s.	*d.*
25	Azaleas, new hardy Belgian varieties, on their own roots, with flower-buds, one of a sort by name ...	20	0
25	American Azaleas, do. do.	15	0
25	Hardy American Plants, one of a sort, by name ...	10	6
12	Hardy Heaths and Kalmias	6	0
12	Rhododendrons, including scarlet, white, and rose-hardy varieties	12	0
	New hardy Yellow Rhododendrons, each 5*s.* 6*d.* to	7	6
	Fine hardy Scarlet Rhododendrons, 2 feet, per dozen...	12	0
	Cedar of Lebanon, 3 feet, well grown in pots, per dozen	12	0
	(Araucaria, Deodara, and Coniferas of all kinds, see List.)		
	Roses, standard and half standards, per dozen... 12*s.* to	15	0
	Climbing Roses of choice sorts, per dozen	6	0
50	Dwarf Roses, two of a sort, on own roots	15	0
	Wistaria sinensis, extra fine, in pots, 5 to 10 feet, each	3	6
6	Fine hardy Magnolias, one of a sort	10	6
12	Greenhouse Azaleas, one of a sort, blooming plants ...	25	0
12	Choice Camellias, by name, do.	30	0
24	Choice Ericas, one of a sort, by name	16	0
12	Orchidaceous Plants, choice species, and good plants	40	0
50	Choice Greenhouse Plants, one of a sort...	45	0
	Tree Carnations, 6 best sorts	6	0
	Cinerarias, flowering strong plants, per dozen... ...	12	0
	Verbenas and Petunias, newest varieties, per dozen ...	6	0
6	Bulbs of Lilium lancifolium, one of a sort	12	0
12	Pæonias, new white, pink, and blush, of sorts	8	0
25	Hardy Herbaceous, one of a sort	7	6
25	Pinks, choice sorts	10	0

FRUIT TREES.

	Fine Dwarf and Standard Peaches, Nectarines, Apricots, Plums, Pears, and Cherries. The best and most approved sorts of these respective kinds, to name, each 2*s.* 6*d.*, or, per dozen	24	0
	Untrained or maiden do., 1*s.* 6*d.* each, or, per dozen ...	12	0
	Apples, dwarfs and standards of best sorts, per doz. 10*s.* to	15	0
	Fine Gooseberries, Currants, and Raspberries, per dozen	3	0
	Figs, Medlars, Walnuts, and Mulberries, each	2	0
	Filberts, new thin shelled and red skinned, per dozen ...	3	0
	Strong Vines, from eyes and layers, in pots, per dozen ...	18	0

New Gardens and Greenhouses furnished on moderate terms.

Albion Nursery, Stoke Newington, London.—March 11.

FIRST-RATE NEW FUCHSIAS, VERBENAS, CINERARIAS, PANSIES, GERANIUMS, PETUNIAS, ETC.

WILLIAM RUMLEY AND SONS have to offer the under-named, in fine strong plants, hamper included, or free by post for prepayment, viz.:—

FUCHSIAS.—The following best new varieties of 1853, 10*s.* 6*d.* per dozen, 6 for 6*s.*, or 1*s.* 6*d.* each, viz.:—Brilliant, Duchess of Lancaster, England's Glory, Glory (Banks'), Incomparable, King Charming, Lady Emily Cavendish, Lady Franklin, Mrs. Patterson, Premier, Perfection, Sir J. Paxton, the Queen, Vesta, Vauban, &c.

VERBENAS.—The following first-rate new varieties of 1853, 6*s.* per dozen, viz.:—Dane Croft Beauty, Elizabeth, Fulgoric, Garland, Glory, Lady Franklin, Madame Boucharlat, Madame Ivery, Madame Lemonier, Madame Rougier, Madame Pommery, Mrs. Kirkpatrick, Orestes, Princesse Marianne, Grandeur Lyonnaise, Vesta, &c.

CINERARIAS.—The following first-rate new varieties, 12*s.* per dozen, 6 for 7*s.*, or 1*s.* 6*d.* each, or smaller plants, 9*s.* per dozen, viz.:—Agnes Wakefield, Admiration, Charles Dickens, Charlotte, Conspicua, Duke of Wellington, Enchantress, Hebe, Kate Kearney, Loveliness, Marguerite d'Anjou, Prince Arthur, Rosalind, and Tyrian Princé.

PANSIES.—The following extra fine varieties, 6*s.* per dozen, viz.:—Adela, Duke of Perth, Blanche, Robert Burns, Sir Philip Sidney, Queen of England, Commander-in-Chief, Diadem, Sir J. Paxton, Euphemia, Mr. Beck, Mrs. Beck, Loveliness, Ophir, Pompey, Blue Perfection, Miss Caroline Bouverie, Fair Flora, Prince of Orange, Lucy Ashton, Yellow Standard, Victory, Nelson, Negro, Wellington, &c.

GERANIUMS.—Choice varieties, 9*s.* to 18*s.* per dozen.

PETUNIAS.—The best new varieties of 1853, 7*s.* 6*d.* per dozen.

The above will be forwarded immediately on receipt of a post-office order payable at Richmond.

Gilling, near Richmond, Yorkshire.

JUDSON'S RICHMOND VILLA BLACK HAMBURGH VINE.

ARTHUR HENDERSON AND CO. have the pleasure of informing their patrons and friends that they have good plants of this valuable and much-esteemed Vine at 5*s.* each; extra strong plants, 7*s.* each.—N.B. For full particulars of the distinguishing characteristics of this Vine, we beg to refer our customers to the *Gardeners' Chronicle* of October 25th, 1851.

HIMALAYA CEDAR.

MAULE AND SONS beg to intimate to Noblemen and Gentlemen engaged in Forest or Ornamental Planting that they still hold large supplies of this universally admired and fine timber tree, which they are sending out at the below quotations.

CEDRUS DEODARA, 2 years, fine, 25*s.* per 100, 10*l.* per 1000
" " *1 foot ... 5*l.* "
" " *1 to 2 feet ... 7*l.* 10*s.* "
" " *2 to 3 feet ... 42*s.* per doz., 15*l.* per 100
" " **3½ to 4 feet ... 60*s.* " 25*l.* "
" " **4 to 4½ ft., extra } fine, for Avenues and single planting } 80*s.* " 30*l.* "

☞ Those marked * are grown in suitable sized pots; those marked ** may be had either in pots or from the open ground.

Large supplies of Taxodiums, Cryptomerias, Pinus excelsa, Abies Smithiana, Cupressus Goveniana, Lambertiana, &c. &c., offered at such prices as will admit of their introduction into mixed forest and other plantations. Terms sent on application.

The Nurseries, Bristol, March 11.

NEW VERBENAS FOR 1854:—

	s.	*d.*
ORION, dark scarlet, with a light eye	3	6
ROBIN HOOD, fine puce self	3	6
MARIE ANTOINETTE, large lavender self, distinct ...	3	6
MATCHLESS, fine purple self, excellent bedder... ...	3	6
BEAUTY, white, rosy purple eye, splendid flower, extra	5	0
MADONNA, white, distinct rose eye, fine habit and free flowerer, a splendid bedder	5	0
ATTRACTION, lavender puce, large white eye	3	6
DIADEM, orange scarlet, very attractive	3	6
NE PLUS ULTRA, splendid blue, one of the best of the colour for bedding	5	0
ARIOSTO, mulberry self, fine habit.		
BEAUTY OF THE GARDEN, excellent trusser, colour pink, with light eye, surrounded with a large circle of bright crimson, a very conspicuous and distinct variety	5	0
The stock of this variety we purchased from Mr. Fozard, of Hall Park.		
SULPHUR MODEL, fine stout habit, with splendid large trusses of excellent formed flowers; colour nankeen or pale sulphur yellow, quite distinct and new in colour	5	0
The stock of this variety we purchased of Mr. Stewart, of Salt Hill.		

All the above have been proved the second season, consequently can with confidence be the more highly recommended; and, with the exception of "Sulphur Model" and "Beauty of the Garden," were all raised by E. Banks, Esq. The collection of the above 12 distinct varieties, 42*s.*

E. G. HENDERSON & SON, Wellington Nursery, St. John's Wood. March 11, 1854.

MAY'S PARAGON CABBAGE, AND MAY'S MAGNUM BONUM LETTUCE.

THE Subscriber, in offering the above for the first time, guarantees it to be the finest Cabbage in existence; of dwarf habit; has never been known to run; attains a large size (having been grown to the great weight of 28 lbs.); of a most beautiful green, and boils tender as Asparagus, which it continues to do throughout the season; in flavour is as far superior to the ordinary Cabbages of the day as they are to the old Drumhead Scotch. In ¼ oz. packets, 1*s.* each, free by post. The usual allowance to the trade.

MAGNUM BONUM LETTUCE.—This incomparable summer Lettuce is also offered for the first time for sale, and in consequence of the impossibility of seeding it in the open air, the whole having been grown in pots under glass, the stock is exceedingly limited. In form it resembles the Maltese, only a little more upright; as crisp as the Paris Cos, never runs to seed, and has been grown to the amazing size of 4 feet in circumference. In packets, 1*s.* each, free by post.

Vegetable and Flower Seeds of the best quality. See Advertisement in the *Gardeners' Chronicle* of January 28.

Address all orders and communications to HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, &c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidence, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introduced by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant bloomer; and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21*s.*

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gaufred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes. Each 21*s.*

HAWKES' CHAMPAGNE RHUBARB.—This most desirable variety is now for the first time offered to the public. It has stood the severest test that can be applied, and has beaten everything in Covent Garden and other London Markets in realising higher prices, from its magnificent colour and size. It has been seen by the very highest authorities and pronounced to be a most valuable introduction. In earliness it equals the Prince Albert, but of a deeper colour, and much greater bearer. It forces remarkably well, and is very hardy out of doors. Mr. HAWKES has placed the entire sale in the hands of Duncan Hairs.

One-year-old plants, strong, 5*s.* each. A few two years old, very strong, for sale.

LAING'S MAMMOTH RED CELERY.—This is considered the largest yet grown, attaining the extraordinary weight of from 10 to 12 lbs., and at the same time perfectly solid. It is nearly perennial in its habit, as it will not, under any circumstances, run to seed the first season, and it is difficult sometimes the second when planted out for that purpose. In colour it is a bright red. In flavour unsurpassed, if equalled.

It has been seen growing by many practical gardeners, who deem it a new feature in the garden, from the fact that it may be had nearly all the year. Packets 2*s.* 6*d.* each.

MITCHELL'S HARDY EARLY CAULIFLOWER.—This is grown precisely as the handglass variety, but when removed from the frame does not require the same protection, and comes in immediately after. This is particularly recommended for gentlemen's establishments. The head is not large, but handsome and compact, and is so firm that you may let them stand from 10 days to a fortnight and they will not get frothy or loose. This is quite a distinct variety. Packets 2*s.* 6*d.* each.

DUNCAN HAIRS, Seedsman, 109, St. Martin's Lane. Post Office orders to be made payable at Charing Cross.

IMPROVEMENT OF GRASS LANDS.

SUTTON'S RENOVATING GRASS SEEDS FOR IMPROVING OLD PASTURES, CLOVERS, and the finer and more nutritious sorts of GRASSES.

Quantity of Seed required, 8 *lbs. to* 12 *lbs. per acre. Price* 1*s. per lb.*, Carriage Free.

All orders executed in rotation, in strict accordance with priority of our receiving the same.—Address,

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

HOLLYHOCKS.

A. PAUL AND SON have now ready for Sale a very large and healthy stock of HOLLYHOCKS, suited to bloom well next autumn; Border Flowers, 4*s.*, 6*s.*, and 9*s.* per dozen; fine named kinds, 12*s.*, 18*s.*, 24*s.*, and 30*s.* per dozen. A fresh supply of their new and unrivalled seedlings, which obtained first prizes at the leading exhibitions last year, and were never once beaten, will be sent out the end of the month, strong, healthy plants. A priced descriptive Catalogue free by post on application.

Recently published, free by post, price 1*s.*, AN HOUR WITH THE HOLLYHOCK.

N.B. Post-office orders may be drawn on Waltham Cross or London.—Nurseries, Cheshunt, Herts.

GEORGE BAKER begs to say that his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, CONIFERS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES, &c., may be had by enclosing two postage stamps.

G. B. wishes to call particular attention to his fine Stock of GREEN and WEEPING HOLLIES, from 1 to 12 feet high.

G. B. has supplied the American Exhibition in the Royal Botanic Gardens, Regent's Park, from its commencement.

American Nursery, Windlesham, near Bagshot, Surrey, about six miles from Staines Station, Windsor Branch, South-Western Railway, where conveyances may be obtained.

WILLIAM NICHOLSON still continues to send out very strong well-rooted Plants of his four new and distinct varieties of STRAWBERRIES, viz., AJAX, dessert Fruit; RUBY, ditto; CAPTAIN COOK, Market Fruit; FILL-BASKET, ditto, at 15*s.* per 100, or 25 each of any two sorts for 10*s.*, box included. Post-office orders payable at Yarm, Yorkshire. For a full description, see Advertisement *Gardeners' Chronicle* Jan. 28, 1854.—Egglescliffe, near Yarm, Yorkshire.

FIRST CLASS PRIZE VERBENAS.—The set of six, advertised by J. KEYNES in his Catalogue will be ready to send out the 21st of March, in fine well-established Plants, by post, free, for 20*s.*

These are six of the most beautiful Verbenas ever offered, and were much admired in the Surrey Gardens, the only place they were exhibited, and obtained First Class Certificates. Only a few sets left unordered.

JOHN KEYNES, Nurseryman, Salisbury, March 11.

GERMAN DOUBLE DAISIES.—A fine healthy stock of the above unique Flower is now offered to the Public. It is very novel and distinct, and such as will give all purchasers satisfaction. Out of the 100 imported varieties, 50 of the most striking and best flowers have been selected, and can be sent out from one dozen plants, and upwards. These Daisies surpass everything for making edgings to flower beds, &c., and are quite a novelty of their kind; price 3*s.* 6*d.* per dozen, postage and package free; or 1*l.* 1*s.* per hundred, hamper and package free.

Also a fine stock of MYOSOTIS VANGLEEKI, or the new improved Forget-me-Not, well adapted for rock-work or making single beds; 2*s.* 6*d.* per dozen, postage free; 15*s.* per hundred, package free.

SWEET WILLIAMS.—A fine stock of very select and striking varieties 2*s.* per dozen, or 10*s.* per hundred, package free.

CHOICE HOLLYHOCK SEED saved from all the best and latest varieties yet sent out; 1*s.* 6*d.* per packet.

SEEDLING ANTIRRHINUM SEED, all from striped and spotted flowers, and will give every one satisfaction; 1*s.* per packet.

GERMAN ASTER SEED, saved from all first prize flowers 1*s.* per packet.

STRAWBERRY PLANTS.—This is an excellent opportunity for those to plant who may have neglected to do so last autumn. Victoria, 5*s.* per 100; Prolific, 3*s.* 6*d.* per 100; Eleanor, 3*s.* 6*d.* per 100; Surprise, 3*s.* 6*d* per 100; Cremont's Perpetual, 5*s.* per 100; and many other leading varieties, package free. The above named will be sufficient to give a supply of fruit the whole of the Strawberry season, being the earliest and latest varieties.

CUCUMBER and MELON SEEDS can be still supplied in varieties, and price, as advertised on the 18th inst. On receipt of a money order, or penny postage stamps, the whole, or any part of the above, will be immediately forwarded.

EDWARD TILBY, Nurseryman and Seedsman, No. 14, Abbey Churchyard, Bath, Somerset.

CONQUEROR OF THE WEST CUCUMBER.

JAMES LAKE, NURSERYMAN, &c., Bridgewater, begs once more to offer the above Cucumber. Having tested its merits against many other sorts highly spoken of, can with confidence recommend it as the best for general frame culture. Packets containing 12 good Seeds sent post free on the receipt of 12 postage stamps.

N.B. The Trade supplied with the genuine article.

J. L. also begs to state that he will be prepared to send out, the first week in May, strong Plants of his beautiful Seedling LOBELIA ST. CLAIR, so universally admired last summer and autumn, at 12*s.* per dozen. The usual discount to the Trade.

The Gardeners' Chronicle.

SATURDAY, MARCH 11, 1854.

THE writer of an article called "Gossip," in the "Florist" of this month, in speaking of the new schedule of prizes issued by the HORTICULTURAL SOCIETY, has made some remarks which indicate such a misapprehension of facts as to call for a few words of comment.

It is insinuated that the prizes for fruit are diminished, and asserted that the exhibitors must trust to chance, having nothing to guide them. To the insinuation we answer that the amount offered under the new system is something more, not less, than has ever been awarded before. The complaint that in making the awards all is left to chance is incomprehensible. The judges will exercise their judgment; they will place the exhibitors as they believe they ought in justice to be placed, and it will be their duty to distribute all the money at their disposal, provided there are subjects to which it can be given. Everybody having experience of exhibitions must be aware that with trustworthy judges it is always better to rely upon their dis-

cretion than to embarrass them with rules; but plants are so varied, and susceptible of such endless modifications of arrangement, that growers would be unable to ascertain how to class their productions in the absence of such regulations as a schedule furnishes. With fruit it is different; the combinations of which it is susceptible are few, the articles producible are few also, and *nothing is excluded*. Judges are therefore not placed in difficulty; but the contrary. To gardeners the alteration is full of advantages, as may be seen from an instance or two. A has good Grapes, good Strawberries, good Cherries; he can produce perhaps a collection of these better than all his neighbours; but if compelled to show Grapes, Strawberries, and Cherries each separately, he is very likely to be beaten at every point. Or he may have the best Strawberries in the county, and it is a great convenience to him to be allowed to show them by themselves. Exhibition tables thus made up can be classified by the judges themselves, who will compare what is susceptible of comparison; and, when no comparison can be instituted, can form an opinion concerning the value of each separate matter exhibited. So again with regard to the relative value of the prizes given to each particular class; let a Society offer SK and SB and C for Grapes; it may and very often will happen that five or six exhibitions of Grapes are as nearly as possible equal in merit. Nevertheless the judges must distinguish them, and pick out three; for which purpose they are driven to have recourse to minute peculiarities, which have very little to do with the exhibitor's real merit; the result is, that A receives 30*s*., B 20*s*., C 10*s*., and D and E nothing at all; although, under other circumstances, each would have been treated alike, as strict justice demanded. But this is cured by the present arrangement, which, we venture to predict, will be attended by very great advantage to all concerned. Let it be observed too, that if, owing to a bad season or other causes, all the money devoted to the service of May cannot be then apportioned among the exhibitors, the surplus is not withdrawn from the exhibitions for the whole season. On the contrary, it forms an augmentation of the prizes obtainable in June; thus, if it should prove that in May only 30*l*. are required for prizes, 50*l*. being offered, then 20*l*., the difference, goes to the prize fund of June, which is thus increased from 60*l*. to 80*l*. The same may take place in June, in favour of July. We confess ourselves at a loss to understand how a better arrangement can be proposed, and we are happy to know that many fruit growers entirely concur in opinion with ourselves. It may not suit everybody, for reasons which it is needless to explain, but it cannot be otherwise than acceptable to those who exhibit for the sake of showing the skill they possess as fruit gardeners.

It is said by the writer in question that the Society shows a great want of liberality. If he will take the trouble to compare the schedules of 1853 and 1854, he will find that the sum now offered in prizes is as nearly as may be the same as was offered in 1853; in some important cases the increase has been remarkable, as, for instance, with Orchids, for which 261*l*. are now offered instead of 157*l*. 16*s*.; with stove and greenhouse plants, which are to have 258*l*. instead of 213*l*. 15*s*.; and with Azaleas, for which 60*l*. are now given instead of 43*l*. 10*s*. Nor is this all; for it must be plain to any one who compares the two schedules, that the scale of prizes is not only increased 50 per cent., but graduated very much better. We are at a loss to understand where want of liberality is shown in changes like these.

It is, indeed, evident that the real ground of complaint on the part of the "Florist" is the discontinuance of prizes for florists' flowers; this is indicated by the stress he lays upon the omission of "seedlings!" meaning, as he afterwards explains, Cinerarias, Pelargoniums, &c. Surely he has forgotten the existence of the National Floricultural Society, and similar metropolitan associations, formed for the express purpose of doing that which he blames the Horticultural Society for not doing. In reality, the encouragement of mere florists' flowers is no affair of the Horticultural Society; the system of doing so is of recent adoption, and has now become superfluous, in consequence of the formation of the associations above alluded to. The Council of the Society seem to have been of opinion that it would conduce far more to the real interests of horticulture (the only interests which they can recognise), if the money hitherto expended upon florists' flowers were applied to augment the value of the prizes divisible among the exhibitors of more important subjects; and they are right.

It is also pretended that dissatisfaction is caused by professional growers, meaning nurserymen, being classed with amateurs, their customers. The fact is, that nurserymen and amateurs are to exhibit separately in Orchids and Roses as before. The change is limited to Pelargoniums, for doubling the prizes in which there is really no pretence. Private growers can and do beat the nurserymen in this class of plants.

After this explanation, we leave the public to form its own opinion of the assertion, that in the new schedule there are "great changes and considerable reductions." Had it been said that there were great changes, and a large augmentation of prizes, which is the fact, we should not have thought it necessary to occupy space with these remarks.

Various inferences having been drawn from, and many doubts being entertained respecting the Cedar Wood of the Ancients, it seems desirable to bring together the few points which have been ascertained in identifying the plant or plants which yielded this very celebrated wood. The name Cedar, derived from the *kedros* of the Greeks, is used in the present day in as general a way as the latter seems to have been among the ancients, for it is applied specially to the wood of Juniperus virginiana—the Red or Pencil Cedar, and to that of J. Bermudiana—the Bermuda Cedar, as well as to others which were certainly unknown to the ancients, and likewise to the Cedar of Lebanon, which may or may not have been known to the ancient Greeks. The only method we have of identifying the exact meaning of many of these names of material substances, is by comparing the passages in classical authors in which they are mentioned, ascertaining the properties ascribed to them, tracing their history through the works of succeeding authors, and then by our more accurate knowledge of the natural history of the countries with which the ancients were acquainted, determining the mineral, plant, or animal to which they must have referred. Following this course, we find the word *kedros* in the most ancient authors, but to ascertain its meaning it is necessary to refer to those who have treated expressly of plants and their products, such, for instance, as Theophrastus, who lived 300 years before the Christian era, and was acquainted with different kinds of Pine trees, with the Cypress, Juniper, and Yew; he expressly mentions different kinds of Cedar—one Lycian the other Phœnician—not unlike the Juniper; one with hard sharp-pointed thorny leaves, fruit fragrant, sweet in taste, and not falling off until the new fruit is being produced.

Pliny, who brings together whatever had been written on such subjects by his predecessors, has copied the above, and says, "The Phœnicians have a tree similar to the Juniper, which is called the Lesser Cedar. There were two sorts of it—the one Lycian, the other Phœnician—which differ from each other in their leaves. For one, which is called Oxycedrus, has its leaves hard, sharp, and thorny; it is much branched and knotty. The other is conspicuous for its odour. Both produce fruit, which is about the size of that of the Myrtle, and sweet in taste." He adds, from some other source or from his own knowledge, that there are also two kinds of the larger Cedar, one which flowers but does not bear fruit, and the other which bears fruit but no flowers, the new fruit appearing before the old is ripe. This fruit resembles that of the Cypress. Some call it the Cedrelate. It produces the finest resin—its wood is everlasting; hence statues of the Gods used to be made of it, as that of Apollo Sosianus, brought from Seleucia. In Arcadia there is a kind of Cedar, but which in Phrygia is called a shrub; "some commentators say, we ought to add of Syria."

It is evident from these quotations, which we might easily multiply, that the lesser Cedars of Theophrastus were species of Juniper, and modern botanists think that both Juniperus lycia and J. phœnicea are included under one head, while the Juniperus oxycedrus of botanists is the Cedar with the sharp thorny leaves. But it is difficult to determine what tree is intended by the Greater Cedar, as it is said to be of two kinds, one being fruitful and the other barren, as we know to be with dicœcious trees, while the Cedar of Lebanon is moncœcious. The fruit, moreover, is said to be like that of the Cypress; whether this means in size, or, not being a berry-like fruit, as in the Juniper, does not appear; but the cones of the Cedar of Lebanon we know are much larger than those of any Cypress. From what we have seen, however, it is evident that the term Cedar was applied to different plants, and probably to the woods which they produced. But we have been unable to find any proof that the tree now called Cedar of Lebanon was known to the Greeks and Romans, and any wood which was imported by them from Syria may, or may not, have been produced by it. For both the Juniperus oxycedrus and the J. phœnicea are produced in Syria, and the former on Mount Lebanon, growing to a height of 10 or 12 and even 20 feet high, while the latter, called also Great Juniper, grows to the height of 20 or 30 feet. But the ancients no doubt applied the term of Cedar wood to others of the Coniferæ, for Virgil mentions the odoratum Cedrum being frequently burnt, and distinguishes the uses to which these several woods were applied in the lines:—

"——— Dant utile lignum
Navigiis pinos, domibus cedrumque cupressosque."

F. R.

VEGETABLE PATHOLOGY.—No. X.

31. It was mentioned previously (No. 11.) that the mass of cells, even in the lower plants, is frequently bound together by an external membrane of greater or less strength, called the cuticle; and this holds good almost universally in the higher plants, all vegetating parts, such as the leaves, young shoots, &c., being clothed with it; those only being excepted which, like the spongioles of the roots or the stigmatic surface, require more immediate contact with the bodies or fluids to which they have a definite relation.

32. On the leaves, especially their under surface, and on other parts where it is requisite that there should be a direct communication with the outward air, the cuticle is perforated with little apertures, variously formed, which are known by the name of stomates. By means of these also evaporation takes place, and moisture is imbibed from the air according to existing circumstances, and perfect health can only be sustained so long as the passage is free and pervious. If, then, they be blocked up by excessive exudation of intercellular substances, or by the dense growth of external parasites, more or less injurious consequences must ensue, according to the extent of the particular agent.

33. In such plants as have a long duration, or in some of short duration where the growth is rapid and vigorous, the cuticle, and the immediately subjacent cells, frequently perish, while the succeeding cells, for a time, retain their vitality. In such cases the cell walls are frequently thickened with a peculiar deposit, in consequence of which they exhibit the chemical characters of cork.

34. In exogenous plants, in which the stem is divided into two distinct systems, the wood and bark, the increase of the former of which is centrifugal, and that of the latter centripetal, the inner cells of the wood gradually become thickened and indurated, and to a greater or less extent lose their vitality, without, however, entirely perishing (except in consequence of lesion, or the decomposition which all organised substances undergo after a greater or less extent of time), as there is no necessity for their dispersion to admit of the accession of additional layers; in the bark, on the contrary, where the new layers are deposited on the concave surface, while the diameter of the cylinder continually increases, this can only be effected by the cracking of the first formed layers, and the gradual decomposition of those which are the oldest. In a few cases only the bark is so vivacious or elastic as to admit of the increase of the wood without being ruptured.

35. The cork cells, mentioned above, soon arrive at their full development, and in consequence the protoplasm is exhausted and they contain air only; where a new layer of cork cells is deposited, with each successive layer of bark, there is in each layer a set of cells endowed with less enduring vitality than those with which they are in contact, and it is probable that this circumstance has a connection, as we shall see hereafter, with the important subject of the fall of the leaf, as it has with the scaling of the bark.

36. The foregoing observations, both as regards the component tissues and the particular phenomena of growth, apply especially to exogenous plants; but in those which are endogenous, the same forms of tissue prevail, though there are no distinct circles of growth, and after a certain time, varying according to circumstances, no increase in diameter, except occasionally, as in Dracæna. In these cases, however, cork cells are often formed, though in others the peculiar exigencies of the individual are supplied by copious deposits of silex. As there are no medullary rays in the wood of endogens, there can, of course, be none in the bark; whereas, in exogens there is a constant and immediate connection with the medullary rays, and the horizontal system in the bark continued from them.

37. The bark in many cases attains a thickness of some inches, and the dead layers are by no means entirely useless; but, in consequence of their being comparatively bad conductors, they serve as a very efficient protection to the tender cambial cells, on the health and vigour of which the continued growth of the tree depends.

38. Many modifications occur in the structure of bark, which it is not requisite to enter upon here, and upon these depend the different modes in which the bark falls off, sometimes in scales, sometimes in long strips, stringy fragments, or concentric layers.

39. As the growth of the stems in exogens is conducted at the point which separates the wood and bark, it is clear that the bark cannot be removed to any great extent without serious or even fatal injury. The denuded surface of the wood will, however, under favourable circumstances, give rise to a new layer of bark, which in a short time will not visibly differ from that originally derived from the young shoot. The mode of growth will come more conveniently under some future head. In succulent plants or organs, wounded surfaces

are soon covered by a layer of cork cells, but the cuticle, when once destroyed, is rarely, if ever, reproduced. A good example is afforded by the disease in Potatoes, known by the name of scab. *M. J. B.*

SERICOGRAPHIS GHIESBREGHTIANA.

This is one of the most useful plants which we possess for winter decoration, producing its bright scarlet flowers in great profusion. To grow and flower it successfully it must be afforded the temperature of an intermediate house, but it will be quite at home during the summer months in a pit which can be kept close and moist, and when in flower it will do very well in a temperature of about 45°.

If young plants of it are procured at once, the present is just the season for starting them into growth. Place them as soon as received in a warm moist situation, taking care to afford them all the light possible; and if the pots are full of healthy roots give a moderate shift, using prime rich turfy peat and sandy loam, well intermixed with a liberal quantity of sharp sand, to ensure the free percolation of water through the mass. If the plants have two or three shoots each, these should be pegged down, in order to induce the lower buds to start into growth; for the plant rather inclines to be of a straggling habit, and without care the specimens will be leggy and thin at the bottom. When the roots have taken to the fresh soil, the points of the shoots may be removed; and these, if planted in light sandy soil, covered with a bell-glass, and afforded a brisk bottom-heat, will strike in a short time; and by potting them three in a pot, and keeping them in bottom-heat till well established, and afterwards growing them in a moist close place, affording them plenty of pot room, and stopping the leading shoots as may be required, they will make nice useful small specimens for late flowering. But stopping must not be practised too late in the season, as this would prevent the plants from blooming in winter. Care must be exercised with the old plants to get them well furnished at the bottom, and they should be kept near the glass, where they will receive all the light possible, merely shading them slightly from the mid-day sun on the forenoons of bright, hot days. If they are got into free growth by the middle or end of May, they may be removed to a pit that can be kept close and moist, which, with a little management, will be a very suitable situation for them during the summer months; or they may be retained in a light place in the stove, where they will probably make freer growth than in a pit. Discontinue stopping about the beginning or middle of August, and keep the plants growing freely until the shoots are some length, and the specimens well filled up, when they may be kept rather cool and dry at the root for a few weeks; after which, place them in a growing temperature, where they will soon be covered with their handsome flowers, and may be removed to a close corner in the conservatory, where they will remain long in beauty. After flowering, cut the old plants back rather closely, and give very little water to the soil for a few weeks, after which they may be turned out of their pots, clearing away all unkind soil, slightly reducing the balls, and repotted in the same sized or smaller pots as may be proper. The plants should now be placed in a close moist temperature, kept near the glass, and carefully supplied with water, where they will soon start into free growth, and if properly attended to, with pot-room, &c., will make fine large handsome specimens in course of the season. By stopping a portion of the plants a month later than the others, the blooming season will be so much prolonged, and a portion of the stock might be grown on, stopping but once, and this not later than the middle of June, to come into flower early in autumn.

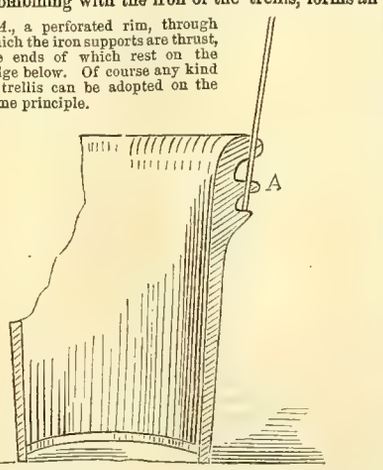
For soil, use good turfy peat and sandy turfy loam in about equal proportions, with a liberal allowance of sharp sand carefully intermixed, and be careful to secure good drainage. A little cow-dung in a thoroughly decayed state might be added, but this may be omitted, and manure-water given instead when the plants are in free growth. *Alpha.*

Home Correspondence.

Leaf Burning under Hartley's Rough Plate Glass.—I do not know whether this kind of glass forms foci or not, but as I have got a large house erected, and do not know what kind of glass to put on the roof for the best, I called at Mr. Rivers' nursery the other day, to see his houses, knowing he had some glazed with several sorts of glass; one was glazed with Hartley's rough plate, supplied by Messrs. Phillips, of Bishopsgate Street, and the Camellias, &c., under it were very much scorched; Mr. Phillips was spoken to about it—he said that it was the wrong sort, and it was taken out and returned; more was sent down, which is supposed to be the right kind, but even now it scorches Camellias, &c., as badly as ever. This house, I have no doubt, can be seen at any time by applying to Mr. Rivers, at the Nursery, Sawbridgeworth. He has one house glazed with extra thick crown glass, which seems to answer very well. One of the clerks at Mr. Millington's, of Bishopsgate Street, informed me that rough plate does burn; he had visited a Vinery last year, in which a very great many of the leaves were quite brown from having been scorched by this glass. Now this is very perplexing and doubtful to one who wants to glaze a house, and does not wish to be put to the extra expense of having the glass taken out after paying, say for rough plate at 5½*d.* per foot, and 5*d.* for the extra thick crown. *Juke.*—[We have long ago explained that leaves *may* be *burnt* under any kind of glass. The difference between Hartley's rough plate and sheet glass we take to be this—under the one they *may* be, and under the other they *must* be burnt. To what sort of burning do you allude? Mr. Rivers, whose name you use, will probably give us his experience in the matter.]

Vallota (?) *miniata.*—We noticed your remarks on this plant, and we think your apprehension that it is not a Vallota will be confirmed on further examination. The seeds are allied to those of Crinum, and are about as large as horse-beans; the capsules turn reddish brown when they are ripe: few are matured. We have succeeded in getting three perfected, so as to vegetate. The plant is of slow increase, but it has flowered three times a year with us for the last two years. It is not bulbous, but produces strong fibres from the base, as in Clivia! We received it from the Cape of Good Hope, from Andrew Steedman, marked Imatophyllum sp., from Natal (not Caffraria). We have a fine plant coming into flower, which, however, was not sufficiently forward to be shown at the Horticultural Society's rooms on Tuesday last. We have sent it to but few persons, and we have now a few young plants, chiefly from suckers. Messrs. Lee's plant is, so far as we know, the first of its increase which has flowered. *Jas. Backhouse, York.*

Plant Support.—The practice of fixing wire trellises and similar supports for climbing plants, which are grown in pots, by thrusting them into the soil, is by no means to be recommended. Independent of the mechanical injury which the roots, bulbs, or tubers (as the case may be) of numerous plants, often sustain, the chemical action, if the trellis is of iron, is exceedingly injurious to most plants; for a portion of the water in the soil, combining with the iron of the trellis, forms an



A., a perforated rim, through which the iron supports are thrust, the ends of which rest on the ledge below. Of course any kind of trellis can be adopted on the same principle.

oxide, under the influence of which few roots can exist. The accompanying is a rough sketch, illustrating a neat and effectual mode of obviating the evil. It is taken from a specimen which I lately observed in a dilapidated old greenhouse, the general keeping of the plants in which was, however, by no means worthy of imitation. The example is, therefore, not new, but it may, nevertheless, be useful. *Crayon.*

Deodar Timber.—Will you allow me to make a few remarks respecting the quality of the Deodar Cedar grown in England, to give my reasons for thinking that it has not yet been shown either that it will or will not produce valuable timber here, or, in fact, that we have any evidence of what its quality will be, sufficient to induce us to plant it extensively in the place of Firs whose qualities are known. Of all trees, the Pines and Firs are the most dependant on climate, or soil, or situation, for the quality of their timber, and the manner in which they make heart-wood. It would be easy to find two Scotch Firs of the same age, both 18 inches in diameter, one of which had 12 inches of heart-wood, and the other not 4 inches; and when we look at a fine Petersburgh or Archangel red Deal, we may fancy the disappointment of a planter, who should have planted 100 acres of Scotch Fir with the expectation that he was going to produce anything like them; yet that is just what we shall be doing if we plant the Deodar with the expectation that in any given number of years we are to grow a forest of timber of the quality which the board shown the other day is described to be. I may just mention, as other instances of great difference in trees in their own country and in England, the Hackmatack, which you mention as so very superior for ship-building in America, as it undoubtedly is; but which I have found very inferior to the common Larch when grown in England; and as an instance of extreme difference of habit, another American tree, the Hemlock Spruce, which is almost as different in appearance when grown in England, from what it is in America, as a Yew tree is from a Silver Fir. The statement respecting the habit of the old Cedars on Lebanon is calculated to produce an erroneous impression; it is true, as Mr. Acworth said, that the old trees (there may be 10 or a dozen of them) have the spreading habit common in Cedars grown in England, but these stand scattered in a grove of 300 or 400, which are mostly tall and straight, and somewhat resembling a fine Silver Fir in England; one which we measured as well as we could, was about 120 feet high, and 3 feet in diameter. Close to this one stood the largest of the old trees, and the only one of them which was not a mere wreck; this tree we measured as well as the uneven nature of the ground would allow us to do. We found it to be between 15 and 17 feet in diameter, at 4 or 5 feet from the ground, which was, in fact, the smallest part of the tree; immediately above that it divided into many large stems: now the largest Cedar I ever measured in England was not much above 17 feet in circumference, with the same spreading habit. The comparison of a branch from Mount Lebanon with one grown in England, and with a plank cut out of the heart of a very old tree of the Deodar, can afford no means of judging of the qualities of the two kinds of timber. The yearly rings towards the outside of the tree, from which the Deodar plank was cut, were so close that they could not be counted. None of us have ever seen a piece of the heart-wood of a Cedar of Lebanon of this age or character; we do not in the least know what it would be like. And again, I can assure you that it is an erroneous idea that the wood of the Cedar of Lebanon has but little smell; half a dozen little chips of the size of that which I sent to you, have perfumed most strongly for several years not only the cupboard they were in, but the whole room; the cupboard was partly made of red Cedar, but the peculiar scent of the Cedar of Lebanon wood quite overpowered the other; it is, in fact, the strongest smelling wood I have ever yet seen (never having seen any Deodar wood), unless it be, perhaps, the wood called camphor wood, which retains its peculiar strong scent for so long a time. I have a few words to say as to the notion that the Cedar beams and pillars in the temple at Jerusalem and elsewhere were probably some kind of Juniper, one of which (the Juniperus Lycia, I think) grows to a small tree on Lebanon, and also in various places among the hills to the east of Palestine, down into Arabia. I have always thought that this theory rested on but slight foundation. The only reason I have ever seen given for it has been the inferior quality of the wood of Cedar of Lebanon, as judged from English specimens. Whatever this may be worth, it is rather arguing in a circle to say now that, because the best authorities thought that the Cedar of the old temples was the wood of Juniper, we had, therefore, no reason to think, from its use in old times, that it had any good qualities as timber. But there are many good reasons, I think, for supposing that the Cedar mentioned in the building of Solomon's temple must have been Cedar of Lebanon. The wood brought from Nineveh seems, as you say, not to be the wood of any kind of Cedar, but Yew. On the whole, then, I think that we have very little from which we can judge of the quality of the wood of the Cedar of Lebanon grown on Lebanon; but my belief respecting the timber of the old trees still is, that it is a wood of very great durability, as it certainly is a wood very full of resin, and with a very strong perfume. Of the real quality of Cedar wood grown in England, I do not think that we know much. It has always shown itself a bad thriver in England, otherwise than as a single tree; grown thus, its growth is extremely rapid, and its wood generally of inferior quality; but I have seen specimens from which I am inclined to think that, if it could be grown in masses together, and to a greater age than it usually reaches, its timber would be very different. The habit of the Deodar is more like a plantation tree; I hope that it will answer as such, and turn out valuable timber in a few years; but, until it is shown by experience that it will do so, I think it would be the height of folly to plant it extensively in the place of Larch, whose value is well known from the time that it is large enough to make a rail. *C. W. Strickland, Hildenley.*

Anemone japonica.—This plant has succeeded so well in my garden, and has multiplied to such an extent, that I am tempted to try it alongside the hedges of pasture fields, but before I do so I am desirous of knowing whether the leaves, flowers, or seeds are likely to prove injurious to cattle, horses, or sheep which may chance to browze thereon. *X. M. N.* [It is not more acrid than a Ranunculus, and probably much less so. We apprehend no danger.]

Autumn-dried Potato Sets v. *the Disease.*—I wish to add a few words of caution and additional advice on the subject of my communication (p. 133), to those who intend to give the plan a trial. If the sets are to be hung up in a dwelling house, whole tubers should be used. There would be a risk of the cut portions being deprived of too much of their moisture, by the excessive dryness of the air. A few might be put to the test for experiment; but I think it would be imprudent to try a large quantity. The only advantages of separating the heads from the whole Potatoes are, that the growth is earlier, and you have more eyes from a given portion of the tuber. I advise, therefore, cottagers to string some washed whole Potatoes, as soon as they begin to use them, and suspend them from the tops of their sleeping or sitting rooms, where they will be out of the reach of mice and the mischievous finger ends of children. Doubts have been raised whether the largest or smaller Potatoes should be used in planting. For this particular method I recommend the middle-sized or rather less. They afford single shoots from the individual eyes, whilst from the lower eyes of a large Regent thus treated I have counted as many as five weak shoots budding forth. Had it been planted in the usual way perhaps only one stem would have grown. But by many who do not deny the propriety of shortening the period of the Potato's "sleep" I may be asked, "What are the particular advantages of this stringing invention of your's? Why not stick to the old plan of boxes and hampers?" My reply is, that in masses Potatoes heat spontaneously.

This implies a certain degree of decomposition, and consequent loss of vitality. The shoots also, as experience shows, are few, long, and tender. But if strung and suspended there is none of this spontaneous fermentation; all the eyes possessing vitality, being placed under the same circumstances, germinate, causing a very considerable saving of seed; the shoots are short, wiry, tough, and not so liable to be broken when planted; the juice being inspissated, through loss by evaporation, of a large portion of the water, the growing vigour of the plant is increased; the expense is insignificant, whilst boxes and hampers cost something; the suspended sets are in nobody's way, and do not prevent cleanliness, nor lumber up the rooms, like boxes, &c.; the Potatoes soon attain so rank a taste that there is no danger of the wife's boiling, in an hour of need, what ought to be saved for the seed of the next year's crop. There are innumerable places, such as the hot dry rooms of manufactories, where Potatoes may be thus prepared, and, judging by my own experience, all who try the method will adhere to it until a better is invented. They who adopt Mr. Cuthill's method of growing the sets in shallow soil, under cover, before planting, might by cutting single eyes, with a small portion of the tuber, raise at least 200 stems per square foot. To effect this a layer of such small sets, eyes upward, should be placed not touching one another (for the dried tuber swells very much when surrounded by soil), and between and above them a second layer should be put. They should be watered at first, but when planted the soil should be quite dry. *L. S.*

Hartley's Rough Plate Glass.—Last year I had a grand Cucumber frame made. It was first chop as to size, two lights, and each fitted up with two glorious squares of Hartley's rough glass. I beat down all opposition by the length of my Cucumbers; the delicate light, and the tender heat; and my gardener has made approaches to the build of a second. But the night before last we had a sharp frost, and there is a diagonal fissure throughout one of the panes. I account for it thus—the glass is thick; the internal heat expanding, and the external cold contracting the glass, a difference arose between those who were without and those who were within. Is this so? [Perhaps.] If so, what protection have the rough plate glass men? [Mats or canvas, or Frigi Domo.] Should it be fixed in the panel in grooves, or how? [In the usual way, but not tight in the rebates.] Be good enough to reply before I put my second into the stocks. *Xprmntatr, Essex, March 7.*

Cost of Burning Clay for Roads and Paths.—I pay the labourers 6*d.* per cube yard for digging and burning. The coal, which is of the smallest description, and known as slack, costs about 5*d.* more, viz., 1 cwt. or 1¼ cwt., at about 7*s.* per ton. Spreading costs about 2*d.*, making a total of about 1*s.* 1*d.* per cube yard when deposited in the road or path. For footways it answers very well, but it is not hard enough for roads, where the traffic is heavy. In such a case as that described by your correspondent "A. F. B.," I would recommend 9 inches of burnt clay for the foundation, and 3 inches of stone for the top of the road, but great care must be taken to fill in the ruts before they get deep, as the road will soon be destroyed if the wheels cut through the stone top. *Richard Varden, Seaford Grange, near Pershore.*

Extermination of Ants (p. 133).—Your correspondent "S. B.," Dublin, would find no difficulty in exterminating the ants from his lawn if, in digging up the early Potatoes, care were taken to discover the nests, which should either have sulphur burnt over them, or rags dipped in turpentine thrust into them, and covered over with sods. At a later period, also, when the winged ants swarm, they should be destroyed as soon as they make their appearance in the winged state. By disturbing the nest at the latter period they come forth in great numbers, and are easily killed by a few pats with the spade. *W.*

Caution.—Some 40 years ago a few Frenchmen opened a shop in St. James's Street for the sale of miscellaneous plants, and amongst other "nouveautes" sold a baronet a "yellow moss" Rose at five guineas a plant. Between that time and the spring of 1852 I heard nothing of a similar swindle; but in March of the year just mentioned (in Bond Street) two of these scamps sold a friend of mine a collection of new Roses "vary sheep," as they "most go avay," not one of which was otherwise than the veriest rubbish,—a plant or two of common Moss and red Provins worked on dwarf stocks being the cream of the purchase. This year, in Regent Street, another "Horticulteur et Fleuriste" has recently commenced victimising the public, an amateur of some standing having bought there last week "Mousseuse Jaune," at the low price of one guinea a plant. I need say no more to convince your readers of the manner in which their pockets will be picked should they venture into this magazine. *C. G. Wilkinson, Western Rose Nursery, Ealing.* [We print this. But such warnings are perfectly useless. The crop of fools is inexhaustible.]

Societies.

Horticultural, *March 7.*—The Right Hon. Lawrence Sulivan in the chair. The Earl of Ducie was elected a Fellow. Messrs. Veitch received a Certificate of Merit for Acacia Drummondi, a very pretty species from Swan River, and a similar award for Boronia Drummondi, a charming little bush, ornamented with perhaps the brightest rosy flowers of any of the genus. This was also stated to have been sent from Swan River by Mr. Drummond. From the same eminent firm, also, came the well known Sarracenia purpurea, in flower; the latter consisting of two round rather compact heads or little bundles of purplish brown leaves elevated on long slender flower-stems that shoot up from among the singular pitcher-like appendages of which this plant is composed. In its native country the pitchers were described as forming excellent fly-traps, the hairs with which their insides are furnished, pointing as they do downwards, permitting the flies to enter with facility; but, when once in, effectually preventing their escape. Messrs. Henderson, of Pine-apple Place, sent a large specimen of the useful winter flowering Conoclinium ianthemum, together with Franciscea confertiflora, one of the best of the genus, two examples of Acacia longifolia, and one or two other plants. A Banksian Medal was awarded.—From Mr. Hume, gr. to R. Hanbury, Esq., came a flowering specimen of the rare Cymbidium eburneum, for which a Certificate of Merit was awarded.—Messrs. Rollisson produced Lycaste brevispatha, a species probably not distinct, except in colour, from L. leucantha.—Mr. Butcher, gr. to W. Leaf, Esq., sent three good bunches of Muscat of Alexandria Grapes; but so much shrivelled as to approach the condition of raisins. A Certificate of Merit was awarded.—Of Strawberries, Mr. Bennett, gr. to J. Smith, Esq., of Dulwich, furnished 6 pots of Cuthill's Black Prince; and a punnet of the same variety of Strawberry, mixed with a few berries of Keens' Seedling, came from Mr. Lewis Solomon, of Covent Garden.—"Majolica" vases, and flower-pots and stands of various devices and colours, were produced by Mr. Good, of South Audley Street, Grosvenor Square.—From the Garden of the Society came Trymalium odoratissimum, Azalea ramentacea, a pretty little white kind, which appears to hold its leaves on well in winter, which the common white sort does not; the useful Azalea obtusa, a handsome plant of Dielytra spectabilis, the Darwin Berberry, a perfectly hardy evergreen species, but nevertheless well worth a place in a greenhouse, owing to the multitudes of charming orange yellow flowers with which, every spring, it is studded. Associated with these were also a large Genista, some Acacias, and Epacrises, Echeveria retusa, a hardy greenhouse succulent, very suitable for window decoration; together with a collection of double white and fringed purple and white single Chinese Primulas, and one or two other plants.

Cuttings of the following Pears were distributed, viz.: Louise d'Orleans: fruit middle-sized, oblong, melting, and said to be of first-rate quality; ripening in November. Délices de Jodoigne: tree vigorous, said to be very productive; fruit large, melting, and rich; season October. Zezamuri from Tiflis: sent to the Society by Messrs. Baumann, of Bolwiller, but has not yet fruited in the garden. And the following Plum: Corse's Dictator: large, purple, and rich; an American variety.

Specimens of the wood of Abies Douglasi, Pinus Laricio, Abies (Larix) Americana, Callitris quadrivalvis, Cupressus torulosa, and other Coniferous trees were laid before the meeting, of which special notice will be taken in our columns next week.

Botanical of Edinburgh, *Feb. 9.*—The President in the Chair. Dr. Balfour exhibited a dissecting microscope, made by Nachez, Paris, the price of which was stated to be 51 francs. He also exhibited a box for holding 24 slides of microscopical objects, made by Mr. Bryson, 24, Princes Street, according to a plan by Dr. Greville. At one side of the box there is room for a series of numbers, which are printed so as to correspond to the grooves for receiving the slides. The following papers were read:—1. On the occurrence of Anacharis Alsinastrum in Ireland. By Dr. Dickie. In a letter to Dr. Balfour, Dr. D. observed—"The accompanying are, I suppose, specimens of Anacharis. If so, we have in Ireland the earliest known record of its presence in the United Kingdom, if I mistake not. I have thought, at all events, it might be a point of interest to you, and worthy of notice at your Society." The specimens were accompanied by the following note by Mr. J. New, gardener:—"About 18 years ago the pond at Waringstown was cleared of overhanging trees, when the Anacharis was immediately observed after the planting of some aquatics, making it necessary several times during the summer to clear it out. It is not known whether it existed in the pond previously to the above date, or was introduced with the aquatics at that time. For many years its name was not known to any person in the neighbourhood."—2. Notes of a Botanical Trip to the Tents Muir, in the north of Fife. By Mr. G. Lawson.—3. Notices of Localities for Rare Plants in the neighbourhood of Edinburgh. By G. R. Tate, Esq.—4. On the Nightshade Family. By P. Fairbairn, Esq.—5. Illustrations of the value of Botanical Histology to the Medical Student and Practitioner. By Dr. Lindsay, Assistant Physician to the Crichton Royal Institution, Dumfries. In conclusion of this communication, the author said—"It appears to me that natural history, botany, and chemistry ought, *inter alia*, to be compulsory branches of general education, with which every medical student ought to be acquainted before he enters upon the more purely medical department of his curriculum. Have examinations on these subjects prior to the first *annus medicus* if you will. This is merely a matter of arrangement and convenience to be adjusted between the professors and the students. The thorough knowledge of these subjects furnishes an admirable training for the mind of every gentleman who has any pretensions to education; and so far from reducing the number of such collateral and accessory branches of the curriculum (or rather, as I think, they ought to be of the general preliminary education), or rendering more lenient the graduation examinations, I hope the tendency will be found to be greatly to increase the former in extent and the latter in strictness, and thus endeavour to raise the standard of attainment.—Dr. Balfour was satisfied that natural history and botany ought to form part of the study of every general student, and that they ought not to be confined to the medical curriculum. No student should enter on the practical study of medicine without having undergone a preliminary examination on these subjects. The degree of M.D. he stated was not merely an evidence of medical knowledge, but a university honour, implying general knowledge and a good university education. Medical students often attempted to do too much within a short period, and hence the aversion which some of them displayed to the study of natural science as taking up too much of the time required for other studies. He was satisfied that the study of natural history was a most important means of preparation for the pursuit of other departments of medicine, inasmuch as it called forth powers of observation and of diagnosis which were eminently required by the medical practitioner. The present day, he thought, was one for enlarging the acquirements of the physician and not for reducing them. There must be something more than a minimum of study for one who is to appear with advantage in society. The attention now paid by all classes to natural science must tend to raise the studies of those who enter learned professions. In concluding his remarks, Dr. Balfour alluded to a paper in the "North British Review," in which it is observed—"We have never been able to discover any satisfactory reason why mineralogy, geology, botany, and zoology should be considered requisite to form a physician more than a divine or a lawyer. Nor should it be concealed, that in consequence of those branches of science being attached to the medical faculty, parents are too frequently prevented from directing their youth-head to the study of those important departments of knowledge with which every one laying claim to a 'liberal education' should be acquainted. Let the patrons of the university remove these chairs from the medical faculty, and place them, together with chemistry, in their proper position along with the usual classes in the faculty of arts. The demand for attendance on such classes by the medical faculty need not be altered, while a new and important element would be introduced in reference to the degree of 'Master of Arts.'"—6. List of Plants in flower in the open air in the R. Bot. Garden, Edin., from January 15 to February 9, 1854. By Mr. M'Nab. When the snow disappeared on 15th January, the following plants were found in flower:—Helleborus niger, odorus, nivalis, olympicus, viridis, and atrorubens. Jan. 20, Tussilago Farfara; Jan. 23, Hepatica triloba; Jan. 24, Galanthus nivalis, Primula vulgaris; Jan. 26, Eranthis hyemalis; Feb. 3, Corylus Avellana, Aubrietia grandiflora; Feb. 4, Crocus sativus. The following gentlemen were elected:—I. As Ordinary Resident Fellows:—R. Daw, W. T. Smith, T. J. Walker, and J. Ross, Esq. II.—As Ordinary Non-Resident Fellow:—T. Barclay, Esq.

Reviews.

Himalayan Journals; or, Notes of a Naturalist in Bengal, the Sikkim and Nepal Himalayas, the Khasia Mountains, &c. By J. D. Hooker, M.D. 2 vols. 8vo, with numerous woodcuts, coloured plates and maps. Murray.

Dr. Hooker is among the few naturalists to whom it has occurred to be personally familiar with the dreariest and richest Floras in the world. His Antarctic voyage brought him acquainted with the southernmost limits of vegetation, where plants can scarcely maintain a miserable existence; his visit to the Himalayas introduced him to scenes where the forms of plants are among the grandest and most varied, and where the unchecked exuberance of their growth ensures them the highest development of which the vegetable world is susceptible; and thence ascending 19,500 feet above the level of the ocean, he once more found himself in presence of another Flora not less degraded than that which struggles amidst Antarctic wastes. No one, therefore, is more able to describe the natural features of such countries, to seize upon the peculiarities of each, and to treat in the spirit of true science the multifarious phenomena that surround the traveller, more especially when it is added that Dr. Hooker is not merely an eminent naturalist but also an accomplished natural philosopher. Such being the qualifications of our author for the task he has here undertaken, it was to be expected that the journal of his proceedings in India would possess the highest interest; and we shall not be charged with exaggeration when we say that the volumes before us are among the most important which have yet appeared upon our great Asiatic possessions. Moreover, they are among the most entertaining, for they are written in a very agreeable style, and the personal narrative is not interrupted by the dry formalities of mere science, all which are collected into an appendix of some 120 pages, where philosophical enquirers can consult them advantageously, while the more general reader may pass them by.

Dr. Hooker left England for India, with the suite of Lord Dalhousie, having obtained a Treasury allowance of 400*l.* a year for two years, to which was afterwards

added 300*l.* for a third year—an allowance so munificent that he was not above a thousand pounds out of pocket when he returned. After visiting Calcutta, and spending some time in Western Bengal, he proceeded to the Sikkim Himalaya, a country then scarcely known by name in Europe, although since made famous among horticulturists by its singular richness in beautiful Rhododendrons. After residing two years in that wild district, during which he succeeded in crossing into Thibet, and in eventually reaching the elevation of between 19,000 and 20,000 feet on Donkia, a mountain some 40 miles distant from Kinchinjunga, the "monarch of mountains," which, although 10,000 feet higher than that position, "looked quite small and low!" Dr. Hooker examined the rich vegetation of Khasia, in company with Dr. Thomas Thomson, of whose excellent account of north-western India some mention was made in these columns in the year 1852. During all this time the author was diligently occupied in collecting objects of natural history, in studying the physical conditions of soil and climate, and in amassing a rich store of barometrical, thermometrical and other observations, of the amount of labour in reducing which some idea may be formed from the single fact that those relating to decrement of temperature in ascending alone amount to more than 4000.

To others we leave the agreeable task of selecting from Dr. Hooker's varied pages such statements as bear upon general subjects. The limited space at our command compels us to limit our extracts to some of the more striking facts connected with the vegetation of these distant regions.

In Behar, Confervæ were found growing in hot springs, wherein the temperature is cooled down to 168°, and as low as 90°.

The bottom heat of a district in the Soane valley, where the Date Palm was abundant, was found to be constantly 71½°, at 3 feet 4 inches underground, that of the air varying from 77⅓° at 3 P.M. to 62° at daylight the following morning. On the other hand, the sand in which Calotropis grew was found to be heated by day to between 90° and 104°; yet such was the cooling effect of evaporation from the surface of the plant that its own temperature was only 72°. The rate, however, at which bottom heat diminished at night is what our forcing gardeners little calculate upon. It was found that in the Soane valley, at the depth of 2 feet, the temperature fell from 93½° at noon to 58° during the night. Such a difference as 35½° between the bottom heat at noon and at night has never entered into the practice of horticulture, nor could it under existing arrangements.

What a description is this of the summit of a low Indian mountain:—

"The top of Sinchul is a favourite excursion from Dorjiling, being very easy of access, and the path abounding in rare and beautiful plants, and passing through magnificent forests of Oak, Magnolia and Rhododendron; while the summit, besides embracing this splendid view of the snowy range over the Dorjiling spur in the foreground, commands also the plains of India, with the courses of the Teesta, Mahanuddee, Balasun, and Mechi rivers. In the months of April and May, when the Magnolias and Rhododendrons are in blossom, the gorgeous vegetation is, in some respects, not to be surpassed by anything in the tropics; but the effect is much marred by the prevailing gloom of the weather. The white-flowered Magnolia (M. excelsa, Wall), forms a predominant tree at 7000 to 8000 feet; and in 1848 it blossomed so profusely that the forests on the broad flanks of Sinchul, and other mountains of that elevation, appeared as if sprinkled with snow. The purple-flowered kind again (M. Campbelli), hardly occurs below 8000 feet, and forms an immense but very ugly, black-barked, sparingly-branched tree, leafless in winter and also during the flowering season, when it puts forth from the ends of its branches great rose-purple cup-shaped flowers, whose fleshy petals strew the ground. On its branches, and on those of Oaks and Laurels, Rhododendron Dalhousiæ grows epiphytically, a slender shrub, bearing from three to six white lemon-scented bells, 4½ inches long and as many broad, at the end of each branch. In the same woods the scarlet Rhododendron (R. arboreum), is very scarce, and is outvied by the great R. argenteum, which grows as a tree 40 feet high, with magnificent leaves 12 to 15 inches long, deep green, wrinkled above and silvery below, while the flowers are as large as those of R. Dalhousiæ, and grow more in a cluster. I know nothing of the kind that exceeds in beauty the flowering branch of R. argenteum, with its wide-spreading foliage and glorious mass of flowers.

"Oaks, Laurels, Maples, Birch, Chestnut, Hydrangea, a species of Fig (which is found on the very summit), and three Chinese and Japanese genera, are the principal features of the forest; the common bushes being Aucuba, Skimmia, and the curious Helwingia, which bears little clusters of flowers on the centre of the leaf, like Butcher's-broom. In spring, immense broad-leaved Arums spring up, with green or purple-striped hoods, that end in tail-like threads, 18 inches long, which lie along the ground; and there are various kinds of Convallaria, Paris Begonia, and other beautiful flowering herbs. Nearly 30 Ferns may be gathered on this excursion, including many of great beauty and rarity, but the tree Fern does not ascend so high. Grasses are very rare in these woods, excepting the dwarf Bamboo, now cultivated in the open air in England."

At p. 164 of vol. i., we have a clever woodcut representing the manner in which trees in tropica climates struggle for existence. It shows how Wightia strangles its neighbours, and graphically reminds the reader of the well-known name given in some West India islands, where such a case is said to represent a "Scotchman hugging a Creole." Dr. Hooker's remark is this:—

"At this elevation we found great scandent trees twisting around the trunks of others, and strangling them; the latter gradually decay, leaving the sheath of climbers as one of the most remarkable vegetable phenomena of these mountains. These climbers belong to several orders, and may be roughly classified in two groups:—1. Those whose stems merely twine, and by constricting certain parts of their support, induce death. 2. Those which form a net-work round the trunk, by the coalescence of their lateral branches and aerial roots, &c. These wholly envelop and often conceal the tree they enclose, whose branches appear rising far above those of its destroyer. To the first of these groups belong many natural orders, of which the most prominent are, Leguminosæ, Ivies, Hydrangea, Vines, Pothos, &c. The inosculating ones are almost all Figs and Wightia; the latter is the most remarkable, and I add a cut of its grasping roots, sketched at our encampment."

Of *Abies Brunoniana* we learn that it occurs in East Nepal, at 8000 feet, and is a beautiful species "which forms a stately blunt pyramid, with branches spreading like the Cedar, but not so stiff, and drooping gracefully on all sides. . . . I measured one, 20 feet in girth." It appears, however, that this species is unknown on the outer ranges of Sikkim, and in the interior occupies a belt about 1000 feet lower than *Abies Webbiana*.

The Chinese *Cupressus funebris* was found cultivated in Sikkim, and some excellent sketches of its appearance are given. *Juniperus recurva* is said to yield beautiful wood, and to reach a height of 60 feet; of *Pinus excelsa*, the wood is admirable, durable, close-grained, and resinous; that of the Sikkim Larch, or Sah (*Abies Griffithii*), splits well and is the most durable of any; *A. Smithiana* and *Brunoniana* have indifferent wood. In the Zemu valley, cradled in storms, along with Cowslips, Primroses, Gentians, and perennial Poppies, occurred a gigantic Rhubarb, forming pale pyramidal towers a yard high. It is the handsomest herbaceous plant in Sikkim, but of no medical value.

But we must pause. Dr. Hooker's pages swarm with similar interesting facts, and we hope to have frequent occasion to recur hereafter to his charming volumes, of which it is not the least merit that they are profusely illustrated with views of scenery, beautifully printed by Messrs. Bradbury and Evans, and are furnished with a good index.

New Plants.

49. HEXACENTRIS LUTEA.

H. foliis oblongis obtusè apiculatis obsoletè dentatis, racemo pendulo laxo multifloro, bracteolis oblongis acutis, annulo hypogyno hinc dente magno acuto.

The beauty of the H. mysorensis, with its large crimson and yellow drooping flowers, exhibited of late years by Messrs. Veitch, will not be easily forgotten by those who saw it in the Chiswick Gardens. Another species, also a tender stove shrub, with the habit of H. mysorensis, but with pure yellow blossoms, has just flowered with the same extensive firm. At first sight it might indeed appear to be a mere variety in colour: but the bractlets that replace the calyx in this genus are narrowly oblong, not exactly ovate, as in *H. mysorensis*; and, moreover, the hypogynous ring is furnished on the side next the fifth lobe of the corolla, with a great fleshy tooth, which is wholly absent in *H. mysorensis*. Twined together these two would present a most beautiful mass of harmonious colouring, when fully in flower. Introduced from India by Mr. T. Lobb.

Garden Memoranda.

ROYAL BOTANIC GARDEN, KEW.—Here as elsewhere the effects of the late cold weather are severely felt. The young wood and succulent leaves of Laurels, common Bays, Laurustinuses, and indeed of nearly all evergreens, have been more or less injured. Numbers of New Holland and New Zealand shrubs that have stood out for years unharmed are this season cut down to the ground, and in many cases completely killed. Several species of Acacia against walls, including large specimens of A. affinis, which have stood well for several years past, are now quite destroyed. Eucalyptus pulvigera and E. amygdalina are killed, and many other species of this genus are more or less injured. Benthamia fragifera, where it was exposed, is dead; but against a wall it will only lose its leaves. Evergreen Oaks and the Chinese Privet will lose a great portion of their foliage, being scalded, as it were, in appearance, and fast falling off. Arbutus procera, against a wall, is scarcely hurt; but where it has been planted as a standard, nearly all its leaves are injured. The Chinese Fan Palm (Chamærops humilis) has not been injured in the least, though it has only had the slight protection of a little loose Fern round its stem. A fine bush of Duvaua dependens, which has been growing on the lawn near the houses for more than 50 years, has never been so much browned as it is this season. Andromedas generally have suffered much, and some of the more tender kinds have been killed outright. Of Dr. Hooker's Sikkim Rhododendrons that have been planted out, cinnabarinum, Thomsoni, glaucum, Falconeri, and ciliatum, have not been injured. The last-named species, indeed, is full of flower buds, which are unfortunately found to expand too early here to escape being spoiled by late frosts. This is, however, the less to be regretted, as when potted and in flower in a greenhouse, this pretty little species forms one of its brightest ornaments, well deserving the little care its cultivation in this way requires. Many plants of it are at present in full bloom in a cool house here, and nothing could possibly look handsomer or prove a greater acquisition at this season. Berberis Wallichi appears to be perfectly hardy, having stood the winter well. Escallonia macrantha has been injured; but not so much so as E. montevidensis, which has been cut back to the root, as is also the Sikkim Lardizabala. Among Conifers, all the Mexican species have suffered more or less, and even Pinus insignis is not free from injury, and the leaves of the Deodar are browned. Cupressus torulosa has been hurt considerably.

It is not out of doors, however, that all the ill effects of the winter are felt; the plants in the large Palm-house have unfortunately also experienced some injury. It will be remembered that during the winter before last the stoke-holes of this house, owing to their being very low, filled with water, which was only kept from extinguishing the fires by pumping it out at great expense. It was, therefore, proposed to remedy this evil by raising the furnaces, which the engineer employed, guaranteed would "draw" on a higher level than that on which they were placed. This, however, they did not do, and consequently during the late stormy and subsequent cold weather, the temperature of the house fell much below what it should have been kept at, causing many of the leafy plants to shed a portion of their foliage, and otherwise sustain injury. They are, however, now, we are glad to state, beginning to recover. Fortunately the Palms received little or no harm. The magnificent tree Fern, Cyathea elegans, which was wont to stand below the gallery stair, has, however, had all its beautiful fronds so much injured that they had to be cut back, and now it is doubtful whether the trunk will push again or not.

As regards Orchids, of which there is a good collection here, all the finer kinds have been moved from the large house which they have hitherto occupied, and have been placed in a smaller stove, which is thought to suit them better. The house they were in is now filled chiefly with Ferns, Pothos, Pitcher Plants, and a few Stanhopeas and Oncids. In order to afford these what shade they require during summer, and at the same time obviate the use of blinds, which on large houses become expensive, the outside of the glass has been painted all over with common green paint, which looks as if it would answer the purpose perfectly. The shade is neither too little nor too great; and this colour is preferred to that of whitewash, with which the glass of this house was coated last year.

It will be remembered that the path round the inside of the old aquarium was inconveniently low, compared with the tank and shelves. This has lately been so much raised as to render inspection agreeable, and the tank and house have been altogether so much altered and improved that plants may be expected to succeed in them. A little hill of fibrous loam has just been made in the centre of the tank for the reception of the Victoria regia, of which several young plants have been raised in another house, and are ready to plant out. The tank in the new Victoria house near the great Palm stove is also being prepared to receive a plant of this Queen of Water-Lilies.

In what is called the New Zealand house Podocarpus neriifolia is now in fruit, the latter being round and green, and seated on the top of a red, fleshy, succulent stalk. We also remarked here two thriving plants of Dacrydium Franklini, the famous Huon Pine.

In a tropical stove Amherstia nobilis is in flower, as are also Napoleona imperialis, and the Lacebark tree (Lagetta lintearia). There is also here a plant of the double Cocoa-nut, which, though apparently very reluctant to start into growth, is nevertheless beginning to push a little, giving hopes that we may yet see it growing and thriving in this country as well as in the Seychelles Island, from which it is said to be disappearing.

Among recent importations were some bulbs, with plants of the Doom Palm from Natal, as well as what has been called Stangeria paradoxa. The latter is described as being half a Zamia, half a Fern, its fronds having the venation of those of the last named tribe, while the stem or trunk has the structure of Zamia. A paper on the subject has been published by Mr. Smith, in the last number of "Hooker's Journal of Botany."

Out of doors vegetation is as yet backward, the cold nights preventing plants and trees from pushing. Clumps and borders are being cleaned and put in order for summer. Some new walks have been made since our last visit, and others, where they required it, are being fresh gravelled.

FLORICULTURE.

PLANTING RANUNCULUSES.—The last fortnight in February, and the first fortnight in March, make the month within which the Ranunculus should be planted. Florists, as a class, are distinguished for forethought, and hence it may be assumed that not only the locality for this floral gem has been allotted in the garden, but the necessary compost prepared. The formation of beds is properly the work of autumn, and the soil should not be disturbed at this season more than about two inches deep; but if in any case this operation has been

neglected, loam of tenacious, but not clayey texture, should be procured, and mixed with half the quantity of decomposed cow or horse-manure; and with this the beds should be made up one foot in depth. The top layer, of two inches thickness, should be free from fresh manure. Vegetable is to be preferred to animal manure for this stratum, if added just previous to planting. The beds should be level, not rising more than an inch above the path, unless the soil be heavy, and the subsoil cold, in which case a greater elevation is admissible. Three feet to three feet four inches will be found a convenient width. For planting varieties under name on a small scale, margin-boards, of three-quarters of an inch in width, painted lead-colour, and numbered progressively with white paint, will be found the most *secure*, and at the same time a neat arrangement, laths of any kind being more liable to disturbance, accidents, or loss. A scale of the bed must, of course, be made and registered. The making of *two* copies will commend itself to the judgment of the prudent, as the loss of one, when the only one, has often been the source of irremediable and protracted annoyance to the connoisseur. Ranunculus roots (or, more properly, tubers), may be planted in drills, one inch and a half in depth, drawn longitudinally in the bed for mixtures, and transversely for named varieties. The rows should be arranged to allow the tubers to be about five inches asunder each way, or six inches by five may be preferable, as an increase of width from row to row one way of the bed, either transversely or from end to end, will have the advantage of room for applying a top-dressing or water, in subsequent stages of culture. The tubers should be placed rather firmly (claws downwards) in the soil; and a knowledge of this fact has led to the origination of many contrivances in the shape of dibbles; but drilling possesses some advantages over dibbling, as, with proper attention, the required firmness of compost around the roots may be obtained, and greater facility be afforded in a drill for placing the tubers correctly, and without danger of injuring or fracturing the claws. After depositing the tubers, rake the beds quite level; and if drying winds prevail, so that the fine surface become very dry, a gentle pressure of the soil will be useful. Prepare a compost for future top-dressing. Good loam, the top-spit of a fat pasture, and decayed stable-manure, or, if the soil be light, old cow-dung, in equal parts, will be suitable for the purpose. *T.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Look very carefully to the watering at this most critical season, and avoid as much as possible giving too much to recently potted plants. Keep close and syringe frequently, so as to maintain a rather humid atmosphere; and until the growth of the plant indicates that it has taken to the fresh soil, apply water very sparingly at the root. Luculias in pots should be encouraged to make free growth, in order to get the wood well ripened, and the plants in flower before those planted in the conservatory border; for it is desirable to prolong the blooming season of this lovely plant as much as possible. Some of the Orchids will probably require shading; at all events, see that the material is ready for use, but do without it as long as possible; and with a little care in removing plants likely to be injured to shady positions, it will not be necessary, at least in most cases, to apply it just yet. A considerable increase in the night temperature of the stoves may be allowed while the present bright weather continues, but this should be obtained not by the use of an extra quantity of coal, but by shutting up early in the afternoon. Maintain a moist atmosphere, and give no quarter to insects of any kind.

FORCING DEPARTMENT.

PINERY.—The delightfully bright weather which we have experienced will have been highly beneficial to Pines, especially to such as are swelling their fruit. Give the latter as much tepid manure water as the state of the soil will permit, and afford them a thoroughly moist atmosphere day and night. Admit fresh air when the thermometer rises to 80° or 85°, but do this by opening the ventilators on one side of the house only, and by no means allow currents to blow through the house and rob the atmosphere of its moisture. See that a steady bottom-heat of from 80° to 90° is maintained, but do not exceed the latter. Let succession plants start slowly into growth, which will induce a compact sturdy habit. Do not exceed 60° by night here, and give a little air when the glass rises to 75°; keep the atmosphere moist, also attend to the bottom-heat, and see that the soil is not allowed to become too dry, or to get sodden, which is apt to be the case from syringing heavily, which, however, is a very bad practice. The syringe should be used merely to dew the plants, and when the soil requires water, a good soaking of clear weak manure water should be given.

VINERIES.—As the berries swell in the early house look at the bunches carefully with the view of ascertaining whether they have been sufficiently thinned, and go over any bunches at once which may require a second thinning, for it is great injustice to leave the berries to be cut out after they are stoned; which is by no means an uncommon practice.

PEACHES.—Keep the young shoots neatly and regularly tied in, so as to admit light and air freely to the foliage, and keep green-fly and red spider at a distance; also apply sulphur immediately if mildew is perceived. Look at previous Calendars, and be careful not to push succession-houses too fast; keep the atmosphere moist, but avoid using the syringe on trees in blossom.

FLOWER GARDEN AND SHRUBBERIES.

Bourbon, Tea, and other tender Roses may now be pruned, and the beds manured and lightly forked. Roses do not object, however, to a rather firm soil, and care should be taken not to injure their roots by forking or digging. The best manure for these is diluted night-soil, which should be applied after loosening the surface soil, and an inch or two of fresh soil sprinkled over the surface to prevent any unpleasant smell, &c. Get walks edged, gravel-rolled, &c., and everything put into the neatest order. Also see that a sufficient quantity of plants for "bedding" are in a fair way to be ready when wanted in May. Sow seeds of tender annuals on a gentle hotbed where they can be freely exposed to air when up, to keep them dwarf and stocky; hardy annuals may also be sown out of doors where they are intended to bloom.

FLORISTS' FLOWERS.

Sow Auricula, Polyanthus, Ranunculus, and Pansy seeds. Make up any deficiency which may occur in beds of the latter from the reserve plants which have been kept in pots during the winter. Auriculas in pots, and Polyanthus also, may have some liquid manure made from sheep-dung; it must not be strong, but used when clear; once a week will be sufficient. Take care that the frames are well covered on frosty nights, and the frame in which the offsets are, that have been lately taken from the mother plants, should be kept usually close till they have freshened up, giving them air only occasionally; a very little attention is requisite to ensure their success. Plant out Hollyhocks; these have a most splendid effect when arranged, with the tallest behind, and when contrast of colours has been carefully studied. Pot Carnations and Picotees in their blooming pots, placing oyster shells on the surface of the soil; this prevents too rapid evaporation.

HARDY FRUIT DEPARTMENT & KITCHEN GARDEN.

While favourable weather continues, push forward operations here with the least possible delay. If not already done, get the nailing finished, the borders dug, and the paths struck out, &c., so as to give an appearance of neatness, and be prepared with covering for the protection of the blossoms, which are being rapidly excited by the bright sunshine. See to keeping up a succession of Peas and Beans, also plant out winter Lettuce on a rich warm piece of ground; and provide a succession of Radish and other small Salads. Manure and dress Asparagus beds. Get Cauliflower plants raised under glass hardened off, and pay every attention to those under the hand-glass, in order to get them in as early as possible, for the destruction of the Broccoli will render these unusually valuable this season. Spinach, Early Horn Carrot, and Stone Turnip, should be sown at once, on a warm rich border, if not yet done; also Leeks, Brussels Sprouts, Savoys, German Greens, Snow's and early sprouting Broccoli, and the main crop of Potatoes should be planted without delay.

COTTAGERS' GARDEN.

If the cottager has neglected to prune his fruit trees, or small fruit bushes, this should not be put off any longer, for vegetation is now fairly on the move, and pruning should be done before this is the case. Also get the ground among bush fruit manured and lightly dug, where not already done. In digging be careful to injure the surface roots just as little as possible. Look sharply after the early Peas, and see that they are not injured by mice or birds. Where they are above ground draw the soil to their stems, raising it on the windy side, so as to form a slight shelter. Plant Fairbeard's Champion of England for succession; and if a few of Fairbeard's Surprise are planted at the same time, they will come in about a week earlier than the Champion.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending March 9, 1854, as observed at the Horticultural Gardens.

March.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Of the Air. Min.	Of the Air. Mean	Of the Earth 1 foot deep.	Of the Earth 2 feet deep.	Wind.	Rain.

Satur. 18	49.5	33.1	41.3	5	0.10	3	8	1	1	2	4	7	2

The highest temperature during the above period occurred on the 15th, 1823, and the 12th, 1841—therm. 67 deg.; and the lowest on the 13th, 1845—therm. 13 deg.

Notices to Correspondents.

ASPARAGUS: *J A.* Apply the salt and soot as soon as the roots begin to form their new shoots—not before.

BACK NUMBERS. Full price will be given for the following Numbers:—1845, No. 24; 1846, No. 7; 1848, No. 46; 1853, Nos. 20 and 49.

BLACK BEETLES: *Lucy Gray.* Sink basins in the floor, till the rim is level with it. Fill them half full of water, and empty them every morning, scalding the beetles which fall in. This method will clear your house if you have patience.

BOOKS: *Sub.* Roberts on the Vine (with the exception of what relates to carrion, which should never be used in Vine borders) will possibly suit you.‡

DAISIES: *Florence.* The Hen and Chickens must be sought in cottage gardens, or small nurseries. It is occasionally offered for sale in Covent Garden. It is propagated by offsets—not by seed.

FRUIT TREES: *A S.* Apples for a west wall may be the Scarlet Nonpareil, Ribston Pippin, Court of Wick, Boston Russet, Blenheim Pippin, Early Harvest, Pitmaston Nonpareil, and Claygate Pearmain. These ought to succeed in your climate, if you do not train their branches too thickly on the wall, so as to prevent its being heated by the sun. The Royal George, Noblesse, and Bellegarde Peaches, and the Violette Hative and Balgowan Nectarines, are probably the best sorts for your situation.‖—*C E J.* Any substance which keeps off cold, and admits air and insects freely, answers the purpose. The inverted shoots of Spruce Firs tied to the branches, straw-bands, canvas blinds, Birch twigs interwoven among the branches, are the materials most commonly in use.—*C F C.* The canker on the shoots of your Pear trees is similar to that which has become very prevalent, even near London, within these few years. It is supposed to result from unfavourable seasons, for many sorts are now affected that were quite clear when the springs and summers were much warmer than they have been of late years. All you can do is to prune out dead wood now; shorten the branches well back in autumn, and under favourable circumstances new and healthy wood will be formed. You must protect your Apricot trees when in blossom. For want of this they have most probably failed in bearing. Partially uncover Figs now.‖

GLASS: *A B.* The kind of glass you mention is described in our Volume for 1851, p. 695. Any of the great dealers can doubtless supply it.‡

INSECTS: *J P.* The grubs which are destroying your young Wheat are the larvæ of one of the many species of Tipula (daddy long-legs), probably T. maculosa. They are very difficult to destroy, as they burrow out of reach of the proposed remedies. Gas-tar water, strong brine, or nitrate of soda, will probably be found efficacious, at least in driving them from the roots of the Wheat. *W.*

IRON ESPALIERS: *W J.* Wood being a slower conductor of heat than metals are, is considered to be more favourable to vegetation; but it is apt to warp and decay when employed for espalier rails. On this account iron is to be preferred, but it should be kept well coated with paint.‖

LABICIO: *W H.* This was exhibited at the last meeting of the Horticultural Society. Its wood is very heavy and full of turpentine. It will be the subject of some separate remarks next week. The tree is one of the best for standing the sea air.

LETTUCES: *J Jones.* No.

LIME: *J A.* We suppose you allude to gas-lime. This substance is useful as a manure, on soils where lime is wanted; and to crops, like Cabbages, &c., which require sulphur. But it must be used cautiously or it will burn. Your mode of mixing it seems to be unobjectionable.

MOWING MACHINES: *An Old Sub.* These are of various kinds, in price from 7*l.* or 8*l.* upwards. A machine-maker will give you particulars. Apply to any person who supplies the farmers with their implements.

MUSHROOMS: *Sub.* Too much moisture either in the atmosphere or bed is doubtless the cause of your Mushrooms rotting off soon after they appear above the surface. As to woodlice, a toad or two kept in your house will help greatly to lessen their numbers.‡

NAMES OF PLANTS. We have been so often obliged reluctantly to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Abbotsbury.* Next week.—*E W M.* We cannot undertake to name plants not in flower. The bulbous-rooted plant is some Grass.—*H H.* It appears to be the fastigiate variety of Quercus pedunculata.

ORCHIDS: *A B.* A north house may answer in summer, but we fear you will find it very unsuitable at other seasons, unless you can maintain in it some rapid circulation of *warm* air.

PINUS NIGRICANS: *T B.* This is the P. austriaca of some; a species common in the Austrian dominions. Endlicher's "Synopsis Coniferarum," together with the list of Conifers published in vol. v. of the "Journal of the Horticultural Society" to correct its errors, will furnish you with the most recent information respecting species.

STORING APPLES. *R V* will feel obliged by our correspondent who reported the successful storing of Apples in sawdust, kindly stating whether the Pine wood communicated any disagreeable flavour to them.

TERMINATIONS OF NAMES: *Tyro.* There is no rule; it is all fancy, and determined by the ear. The plan now is to give the termination ii to names ending with a vowel, and i to those ending with a consonant. But it is not much, if at all, attended to.

THE BRINJAL: *Ignoramus.* This is the Aubergine, Solanum Melongena, a cultivated variety of the Egg-plant. If *well ripened* and *well cooked*, it makes a dish of great excellence.

VINES: *J C.* Your house being 34 feet by 20 feet wide, and span-roofed, you will not be able to mature shoots to reach the top in one season from the time they break naturally outside. Therefore you had better make sure of filling your house by planting 10 Vines on each side, adopting the spur system of pruning. You should substitute the Royal Muscadine for the Grove-End Sweetwater.‖

VINE MILDEW: *R M.* If you will reduce to figures, put in a tabular form, the results you have obtained, we will willingly publish them; but we cannot ourselves undertake the labour of such reduction. The test papers afford good evidence of the state of the atmosphere, and the inquiry seems worth prosecuting further. The little book is left for you at the office of this Paper.

WIRE TRELLIS FOR WALLS: *S P P.* The French cultivators of the Peach were long in the habit of training on trellis work, either of wood or iron, but generally wood, whilst in England the trees have been usually nailed close to the wall. This mode the French are now adopting, and on the other hand trellises are coming into use in this country, although it is colder than France. It is necessary in the case you mention, as the stucco will not hold the nails.‖

MISC.: *J S.* By pure liquid tar may be understood a tar which is not of a thick consistence, nor adulterated with coal tar; it is the same as thin Stockholm tar.‖

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

NOTICE.

THE SEWAGE MANURE COMPANY beg to state that the higher price of PEAT CHARCOAL, and the increased expense of making the Manure in its present improved state, have compelled them to advance the price of the Manure to 4*l.* per ton: but at this price it still is the cheapest, and one of the best Manures that can be used, yielding a greater return for the outlay than Guano or any other Manure.

N.B.—No charge will be made for sacks; and in quantities of a ton, or upwards, it will be delivered at the Railway Stations in London free of charge for cartage.—March 11.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. Gibbs & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London: and from all the other Agents of the Company.

PERUVIAN GUANO, the guaranteed import of Messrs. ANTONY GIBBS AND SONS, Lobos Island Guano, Superphosphate of Lime, and all Artificial Manures, Linseed and Rape Cakes, &c.—Wm. Inglis Carne, 10, Mark Lane, London.

SEWAGE GUANO, 5*l.* 5*s.* per ton (bags included). Circulars and Testimonials forwarded on application.

DEODORIZING CHARCOAL, 1*l.* 10*s.* per ton (bags to be returned). Terms: Cash on delivery.

The Manchester Sewage Guano Company, 3, Watling Street, Shudehill, Manchester.

E. Ransbottom, Agent.
John Thompson, Secretary.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. Nesbit, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analysis and Assaying, will find ample facility and accommodation at the College.

PEAT MOSS CHARCOAL, AND OTHER MANURES.—The Undersigned are appointed sole Agents by the Peat Moss Charcoal Company, for the sale of this valuable fixer and distributor of ammoniacal matter.

Also on Sale, Peruvian Guano, Superphosphate of Lime, Gypsum, Nitrate of Soda, Bone-Dust, Sulphuric Acid, and all other Manures of known value.—Apply to Mark Fothergill & Co., 204a, Upper Thames Street, London.

THE FOLLOWING MANURES are manufactured at Mr. Lawes' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

SUPERPHOSPHATE OF LIME MANUFACTURED by Mr. J. C. NESBIT'S IMPROVED STEAM MACHINE. The following is the analysis of an average sample.

"College of Chemistry, Agriculture, and General Science, 38 & 39, Lower Kennington Lane, London.

Analysis of Sample of Superphosphate of Lime from Mr. Jolliffe:

Moisture		13.97
Organic Matter, &c.		21.98
Silica		6.05
Phosphate of Lime		35.27
Soluble	16.10	
Insoluble	19.17	
Sulphate of Lime, &c....		22.73
		100.00
Nitrogen (equal to)		1.16
Ammonia		1.41

(Signed) J. C. Nesbit."

Delivered free at a Wharf or Railway Station in London at 6*l.* per ton.—Apply to E. Y. Jolliffe, 70, Mark Lane, or the Works, Lavender Dock Wharf, Rotherhithe.

Agents wanted in all the principal towns.

REDUCTION IN PRICE.

WEIR'S IMPROVED GALVANISED WROUGHT IRON LIQUID MANURE PUMP.

The Fittings of these Pumps are wholly of Brass, and there is no leather or other matter which can be affected by the manure.

Price, complete, with 10 feet of Flexible Suction Pipe, 4*l.* 15*s.* Terms, cash on delivery.

Edward Weir, Agricultural Engineer, 16, Bath Place, New Road, London. Removed from Oxford Street.

Catalogues, with Illustrations, sent free by post.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water; Fire Engines, &c.

An Illustrated Book sent on application post free.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*

WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

SAMUELSON'S PRIZE FORKING or DIGGING MACHINE, as applied to Spring Cultivation, serves to thoroughly pulverise land which has been trodden by sheep or autumn ploughed, deepening the staple, leaving no pan, dragging up the Couch Grass, and preparing a finely divided seed-bed.

Extracts of Testimonials from persons using it.

"Answers thoroughly; brings everything to the surface."—*E. W. Wilmot, Congleton.*

"The very best a man can have upon a mixed or stiff soil, it so thoroughly pulverises it."—*Joseph Cooper, Acton Burnel, Salop.*

"I inform you, with the greatest satisfaction, of its success."—*Francis Hamilton, Friars Place, Middlesex.*

"Attached horses at half-past 8, on 5½ acres, finished at a quarter past 3, making first-rate work."—*J. Kirby, Bodicott, Oxon.*

"Has been working every day."—*T. Cardus, Barwell, Surrey.*

"Will do a given amount of labour, not only cheaper but better than the plough."—*J. J. Mechi, Tiptree, Essex.*

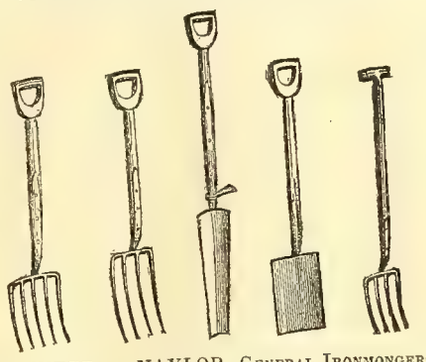
"Let me have one at your earliest convenience."—*Earl of Essex, Cassiobury, Herts.*

"Send to Exton Park one of Samuelson's Forking Machines for *Earl of Gainsborough, Oakham.*"

"Besides improved tillage, economises ploughmen."—*P. Gener, Cuba.*

Price 24*l.* 10*s.*, the general purpose size; and 27*l.* 10*s.* large size Cash; at the Works, Banbury.

TO AGRICULTURISTS, GARDENERS, ETC.



BENNETT AND NAYLOR, General Ironmongers, and Factors, Sole West End Agent for PARKES', late WINTON PARKES' CELEBRATED STEEL DIGGING FORKS and TOOLS. Also for the only efficient Stove, with or without a flue, suited particularly for Conservatories and Greenhouses, Patronised by her Majesty. Price 12*s.*, and upwards, at the Great Western General Ironmongery Warehouse, 255, Oxford Street, between Park Street and North Audley Street. Established for the sale of all descriptions of Ironmongery at Wholesale Prices. Sheet, Hoop, Rod, and Bolt Iron; Locksmiths and Bell-hangers. Patent Fuel, to be used with the Stove, 2*s.* 3*d.* per bushel.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. Burgess & Key, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

TO LANDOWNERS, SOLICITORS, ESTATE AGENTS, ETC.

THE LANDS IMPROVEMENT COMPANY, incorporated by special Act of Parliament, 1853, having perfected their organisation, are prepared to receive applications for the execution of improvements, under the provisions of their Act.

The Act extends to England, Wales, and Scotland; and empowers persons in the actual possession of lands, or in receipt of the rents, such as tenants for life, trustees, bodies corporate, incumbents of benefices, mortgagees in possession, guardians of infants, &c., to effect substantial improvements on their estates, and to convert the outlay on such improvements into a terminable annuity or rent-charge of from 14 to 25 years, at will.

The Company, acting under the supervision of the Inclosure Commissioners, will undertake and execute improvements, or will supply the capital to landowners preferring to execute improvements themselves, or will grant the powers of their Act to landowners seeking merely to charge the inheritance with the outlay on improvements from their own funds.

The Agricultural Works of Improvement particularly specified in the Company's Act, are:—

1. The Drainage of any Lands by any such means as the Inclosure Commissioners shall approve.
2. Irrigation, and Warping of Lands.
3. Embanking of Land from the Sea, or Tidal Waters, or Rivers, in a permanent manner.
4. Enclosing or Improving the Drains, Streams, or Watercourses of the Land, under the Inclosure Commissioners.
5. Reclamation of Land lying waste.
6. Making Farm-roads to the extent of one-half of the outlay for such roads.
7. Clearing Lands.
8. Erection of Farm-houses, and other Buildings required for farm purposes to the extent of three-fourths of the outlay for such Farm-houses and other Buildings.

In effecting the above Improvements there may be erected any Engines, Machinery, Engine-houses, Mills, Kilns, Sheds, Yards, Shafts, Tanks, and Reservoirs, Pipes, Conduits, and Watercourses for Irrigation, Tram-roads and other ways, Bridges, Weirs, Sluices, Flood-gates, and Hatches.

For Forms of Application and further Information apply to the Hon. W. Napier, Managing Director, 2, Old Palace Yard, Westminster, London.

PATENT ROOT GRATING MACHINE.

BUSHE & BARTER'S PATENT ROOT GRATING MACHINE, Manufactured and Sold by Alex. Shanks & Son, Arbroath, Forfarshire, from whom particulars, with prices, may be had.—Arbroath, March 11.

PURVEYORS OF LIVE BIRDS

BY SPECIAL APPOINTMENT TO HER MAJESTY AND H.R.H. PRINCE ALBERT.

BAKER'S POULTRY RESTORATIVE.—Ten years' experience of its success, in all Diseases of Poultry, justifies them in recommending it with the greatest confidence; one among its many advantages being the facility with which (in its liquid form) it is administered, obviating the troublesome necessity of handling the birds, and speedily imparting such vigour and high condition that can be acquired by no other means. Price 2*s.* 6*d.*, either in Liquid or in Pills, with directions for Roup, &c. By all Chemists.

BAKER'S REGISTERED FOUNTAINS, for Poultry, Pheasants, and Pigeons, supplant all others. Four quarts, 6*s.* 6*d.*; nine quarts, 8*s.* 6*d.*—Messrs. Baker, City; and the Pheasantry, Beaufort Street, Chelsea.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

BAILY'S ROUP AND CONDITION PILLS FOR POULTRY.—This remedy has been extensively tried with uniform success, and is offered to amateurs and the public with the greatest confidence. It will effectually overcome that disease which has hitherto been the bane of the poultry-yard, and destroy that apprehension known to all poultry keepers, when a favourite and valuable fowl is seen to droop. It is inestimable for poultry returning from exhibitions, and greatly facilitates moulting.—Sold, with full instructions for use, in boxes containing 50 pills, by John Baily, 113, Mount Street, Grosvenor Square, price 3*s.* per box, or by post 3*s.* 4*d.* "Fowls, by Baily," the most useful and plainest treatise of the day; price 2*s.*, by post 2*s.* 6*d.*

Baily's Registered Fountains, universally adopted and approved. Drawings and particulars, by post, on application.—113, Mount Street, Grosvenor Square.

AGRICULTURAL SEEDS.

(CARRIAGE FREE.)

SUTTON AND SONS, Seed Growers, Reading, Berks, *have a large Stock of Home Grown Seeds of all the best varieties of Turnips, Mangold Wurzel, Carrot, Clovers, Natural Grasses, &c., which they are now sending out at the lowest market prices.*

In consequence of an unusual press of business at this season, we have been unable to present our friends with a full descriptive Catalogue of our Agricultural Seeds, but a *priced* list of the leading kinds were published by us *in the last page of the Gardeners' Chronicle of January 28, all of which articles can still be supplied, as also all other approved kinds of Agricultural Seeds. We shall also be happy to make special contracts for extra large quantities.*

All orders faithfully executed in strict rotation, according to priority of our receiving them.

Sutton & Sons, Seed Growers, Reading, Berks.

RENDLE'S AGRICULTURAL PRICE CURRENT AND FARM DIRECTORY FOR 1854 *is now published, and can be obtained in exchange for six postage stamps, from* William E. Rendle & Co., Seed Merchants, Plymouth.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—LINCOLN MEETING.

The Society is desirous of Contracting with parties for the following Supplies for its ensuing Country Meeting at Lincoln:

1. One small Stack of Wheat (not exceeding 40 or 50 quarters), for the Trial of Threshing Machines.
2. One small Stack of Barley (not exceeding 60 or 70 quarters)
3. Straw for the Show-yard, and the rate per ton.
4. Hay for the Show-yard, and the rate per ton.
5. Green Food (either Vetches or Green Clover), and the rate per acre or per ton.

Forms of Tender for these Supplies, and particulars as to the delivery, to be obtained of the Secretary of the Society, No. 12, Hanover Square, London.

By order of the Council,
James Hudson, Secretary.

London, March 4.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

PRIZE SHEETS *for the* LINCOLN MEETING *may be had on application to the Secretary of the Society, No.* 12, *Hanover Square, London.*

The Agricultural Gazette.

SATURDAY, MARCH 11, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS

Wednesday, March 15—Agricultural Society of England.
Thursday, — 16—Agricultural Imp. Society of Ireland.
Wednesday, — 22—Agricultural Society of England.
Thursday, — 23—Agricultural Imp. Society of Ireland.

As we have not room for a report of the discussion which took place before the Central Farmers' Club last Monday, on the subject of Agricultural Statistics, we must be satisfied with stating in this place the resolution that was adopted, and the mode in which it was arrived at. There was considerable difficulty in drawing one which should satisfy a majority of the members present; and the one drawn by Mr. Bennett, which was ultimately carried, was altered after an amendment to it had been put to the meeting, so that the latter hardly had fair play done to it. Mr. Bennett's original resolution affirmed the public advantage of statistical information, immediately after harvest, on the quantities of the main article of human food, whether in the hands of farmers, millers, or importers—and it stated that if the facts were collected judiciously, they would be useful rather than injurious to the agricultural interest The chairman's amendment affirmed the desirability, on public grounds, of statistical information regard-

ing the products of *all* industrial occupations, but stated that *it would be of no use to farmers.* The differences between the two were—first and mainly the opinion of the former, that farmers would benefit by the information obtained; and secondly, the opinion of the latter, that *all* classes of producers ought to be called upon for it. The first of these differences was of much greater importance than the second, and yet after the amendment (inferior to the resolution only in respect to the first of these differences between them) had been put, the original resolution was modified, so that the second of these differences alone remained: and it goes out to the local farmers' clubs of this country, that the central body, to whom they are to look for guidance, especially in their relations to Government, believe that farmers are not themselves at all interested in the publication of agricultural statistics; while, to those who may read a full report of the discussion, the opinion will appear to have been very generally expressed, that farmers really run considerable risk of injury by such publication.

It will appear on a comparison of the resolutions arrived at on this subject, when it was discussed by the club in 1847, with that which was passed last Monday, that the London Farmers' Club has very materially altered its opinion on the subject. *Then* it was resolved that both landlord and tenant were personally interested in having correct knowledge of the prices and quantities of agricultural produce, and that agriculturists generally were interested in knowing how fast and in what direction agricultural progress tended; *now* it is resolved that farmers cannot benefit by a knowledge of the facts which correct agricultural statistics would furnish. And we are particular in describing how such a remarkable conclusion was arrived at, in order that justice may be done to those members of the club who were thus accidentally, and, as it appeared to us, *irregularly* deprived of all opportunity of representation in the decision that was arrived at: who would have gone farther even than Mr. BENNETT's original motion, both as to the subjects of the statistical inquiry, and as to the opinion expressed of its value; but who, after opposing the amendment, unexpectedly found themselves quite as unable to vote for the resolution.

The debate embraced the following points:—Mr. BENNETT's opening address stated that (1) the subject had been previously discussed in that and other clubs, and farmers had been alive to its importance; (2), the object of agriculture was, *first*, the provision of food, and *secondly*, its provision without fluctuation in the supply; (3), this fluctuation could not be wholly hindered, but, if to know the nature of a disease was half-way to the cure of it, then the knowledge of our wants and resources would go far to cure this evil of fluctuation; (4), no adequate means of such knowledge exists, and ignorance on this point, as it had proved injurious and even destructive in 1847, so it might again in 1854—a year of nearly equal excitement; (5), those, however, who suppose that farmers will submit to any inquisitorial examination into every detail of his business, reckon without their host; (6), one great cause of his reluctance is distrust of Government, who ought to have obtained all the information which they now deem so desirable before they changed their policy towards the agriculturists of this country; (7), patriotic feeling will, however, overcome this reluctance; and Mr. BENNETT then proceeded to detail his plan of procuring the information required, which, he contended, ought to be given by *all* holders of food as well as farmers.

Mr. CUTHBERT JOHNSON stated what was doing in other trades, and contended that too much knowledge could not be had, and that the more opinion coincided with fact, the safer the guidance it offered for conduct in the market and elsewhere.

Mr. BAKER, of Writtle, replied to Mr. JOHNSON's remarks on the ground that manufacturers regulated the extent of their manufacture by information of produce elsewhere; but that the farmer always aimed at producing a maximum, and such knowledge would thus be of no use to him. It would, however, be useful to the country; and he stated his plan for collecting and publishing it.

Mr. WALTON asserted the usefulness of the proposed information, and would have the club to sanction the Government plan. He did not see the need of employing valuers in the estimation of the crops—the farmers could do that for themselves. Other gentlemen followed on the other side, arguing against the inquiry, as inquisitorial, as a mere scheme for reducing prices, as an instrument by which farmers may criminate themselves, and so come under the operation of the penal clauses in their leases—and so on.

Mr. SIDNEY, in reply to the charge of an inquisitorial examination into the business of the farmer, showed how society necessarily involved the surrender, to a certain extent, of personal liberty, and how from birth upwards we were the subject of official inquiry and registration; he showed, too, that the terms of the alternative were not—correct information on the one side, and the absence of information on the other—but, correct information and *incorrect;* that Government *would* obtain and publish a statement of the subject such as it could get, and it was for the interest of all parties to make it as nearly correspondent with the truth as possible. Of all policies for the agriculturist, the policy of suspicion was the worst.

We do not pursue the discussion further; or refer at present to the details of the various plans for collecting the information that the several speakers suggested. The main fact of the matter is, that the Central Farmers' Club of England has passed a resolution which amounts in effect—*i. e.*, in comparison with what was expected from them—to a condemnation of the movement towards the collection of the agricultural statistics of the country. Probably the most important influence of such a resolution is that which it must ultimately exert upon the reputation of the body from whom it has proceeded.

OUR advertising columns indicate the advent of seed time, and the weather of the past fortnight has brought both purchasers and salesmen earlier into the seed market than they would otherwise have come. The Highland and Agricultural Society have thus most admirably timed the interesting discussion which took place before them last week, on "*The varieties of Turnips most suitable for different localities and purposes, and the best means of obtaining good seed.*" We have not room for a full report of the valuable papers on this subject which were read on that occasion, and must therefore be satisfied with a condensed statement of the information and experience they recorded.

Mr. GIBSON, of Woolmet, East Lothian, referred to the White Globe, the Hardy Green Globe, the Purple and Green-top Yellow, DALE's Hybrid, and Swedes, as the varieties grown near Edinburgh. Of these, the first, the most valuable of all for early use, is now sown to a very limited extent, *owing to the spurious varieties sent out by many of the seedsmen.* The second is esteemed for crop and hardiness, and for leaving the land in better condition than some other varieties. The Purple-top Yellow is esteemed more highly by the dairymen than any other sort, and this is attributed to the careful way in which the variety has for many years been selected and cultivated by Mr. SKIRVING, of Liverpool. The Green-top Yellow is also spoken of as a valuable variety. DALE's Hybrid, it is said, has not had that attention paid generally to its selection for seed which hybrids, from their inclination to sport, require; consequently the Turnip grower is often disappointed with its unshapely form and coarse roots; it produces a good crop, is well adapted for poor soils, and worthy of every attention being paid to its proper selection for seed.

These are the sorts mostly used by the dairyman. The selection of a variety of Swedish Turnip is a matter more for the consideration of those concerned in the manufacture of beef and mutton. On this Mr. GIBSON says:—

"It is now 15 years since I got SKIRVING's Liverpool Improved Purple-top Swede from himself. I was so bigoted in opinion as to the superiority of what was generally called East Lothian Swede, and some other varieties grown there and elsewhere, that I continued to grow them alongside of SKIRVING's Swede, year after year, but always with the same result. When sold by public roup, the SKIRVING variety generally brought 4*l.* to 6*l.* per acre more price than any other. I have been told that this arises from their showing more bulb above ground than some other varieties; but I have often tested their weight, and generally found an excess of weight in their favour to justify the difference of price."

In reference to the further remarks of Mr. GIBSON on the feeding quality of Turnips, we must remark that this depends not only on its seed, but on the circumstances under which it has been grown. And we doubt if Swedes and Turnips grown in the south of England can ever yield results in feeding like those which are within the ordinary experience of the Scotch farmer. On this subject Mr. GIBSON says:—"I am satisfied the varieties most suitable for cattle feeding in this district are Globe and Yellow for the months of September and October, and SKIRVING's Swede thereafter. I have generally found cattle feed better after the two first months on Swedes alone than they do upon the other varieties, even with the addition of 5 lbs. per day of oil-cake. When the Turnips are to be eaten on the ground by sheep, the varieties I sow are, Purple-top Yellow, Hardy Green-top Globe, DALE's Hybrid, and SKIRVING's Swede, consuming the Swedes last, and the earliest sown of the other varieties first."

Mr. GIBSON's remarks on the seed trade, in so far at least as regards the provision of Turnip seed, deserve serious consideration. The general complaint on this head is that Turnips now-a-days run more to neck, are smaller in the bulb, and coarser on the top and root than they used to be; and he attributes this to the changed character of the seed trade of late years. "Instead of carefully grown seed being eagerly inquired after, at prices which would remunerate the grower for his selection, he has been told that, unless he can offer his seed at the London wholesale prices, his seed must remain unsold. Growers, therefore, have been forced either to give up the growing of carefully selected seed for sale, or take some other mode of meeting the requirements of the trade, and the system now general is to prepare the land for a crop of Turnip for seed after some other crop has been reaped, and the seed sown so late as to leave no chance of the Turnip bulbing. To this system of growing Turnip seed may be traced the evils generally complained of by Turnip growers. The wholesale prices paid of late years to the Turnip seed grower have varied from 11*s.* to 20*s.* per bushel, weighing about 50 lbs. Parties purchasing this seed afterwards in retail, from the seedsmen, will generally find the price charged to be sufficient to yield a handsome profit; and no Turnip grower would grudge paying even a double price to secure carefully selected genuine seed, the difference to him in cost of seed would only be a few shillings per acre, whereas the crop produced might be doubled. From the price charged for the Turnip seed, the Turnip grower is entitled to have a genuine article delivered to him, but in too many instances this is not the case; before the Turnip seed reaches the farmer it is adulterated, often to the extent of from 20 to 30 per cent.; the Globe and Yellow being mixed with wild Mustard seed, the Swede and other round seeds with a sort of wild Rape seed, imported largely from the continent, and worth only from 4*s.* to 5*s.* per bushel. A regular trade is made of destroying the vegetative powers of these spurious articles by chemically killing or kiln-drying; this is generally done in London, is made no secret of, and the article sold "warranted not to grow."

Mr. GIBSON goes on to speak of an attempt, apparently unsuccessful, which has been made in Scotland by an association of seedsmen to check these nefarious practices.

The remedy offered by the next speaker, Mr. ELIOT, of Hardgrave, Dumfriesshire, was that farmers should grow their own seed. He says:—

"I have no hesitation in saying that farmers err greatly who either do not transplant their own Turnips annually, selecting the best bulbs, of whatever variety they intend sowing, or join together in different localities and get one of their number, in whom they have confidence, to do so, and buy from him. Every breeder of stock knows that to be successful, careful and attentive selection is absolutely necessary; and rest assured that equal care is necessary to secure perfection in the vegetable as in the animal kingdom. To be convinced that at present this is not even attempted by many of our seedsmen, it is only necessary in passing through the country during spring, when the Turnip fields intended for seed are in full flower, to go into some of them and inspect the description of Turnips from which the seed is raised, to feel perfectly satisfied, as I have long done, that we are in error in buying from seedsmen in the indiscriminate manner we have been doing; because on inspection you will find, instead of seed being raised from selected bulbs, or even from Turnips arrived at full maturity, that in nine cases out of ten, or at least in the great majority, the seed is raised from late sown Turnips, scarcely even thinned, and the bulbs in consequence often little larger than pigeons' eggs. So long as this state of things continues, be not surprised that the average weight of Turnips in one of our best Turnip growing counties in Scotland does not exceed the low quantity of 15½ tons per acre."

We conclude with the following statement by Mr. MAKINS, of Auchincraw, Berwickshire, of the plan to be adopted by any one who would raise his own seed, and so escape the risk which all buyers of seed now-a-days more or less undergo. We abridge the statement made by Mr. MAKINS as follows:—

"I have raised my own Turnip seed for about 20 years with success. To preserve the bulbs uniform, and the seed pure, I originate my stock from one bulb of the shape I wish, with a smooth skin. This is transplanted in the garden, and covered with a net. As well shaped bulbs often prove mongrels, it is proper to transplant two or three besides the selected one, in order to secure the possession of one genuine plant. When the seed of this (my stock Turnip plant) is ripe, I cut off the entire seed stem and hang it up in the granary until it is nearly dry, when I clip off the pods and keep them in paper bags until the season of sowing the seed arrives, when it is rubbed out of the pods: and if of Swedes, it is mixed with about a pound of White Globe seed, and

sown in the drills in the field in the ordinary way, and the quantity will extend over about an acre of ground. The plants should be carefully thinned, picking out the globe plants, and leaving the Swedes single. The reason for mixing Globe seed is that the small quantity of Swede seed may go over a large space of ground, that their produce may afford the greatest number of bulbs possible for future transplantation. When I raise Globe seed, I mix Swedish seed in like manner. The crop thus obtained will amount to 5 or 6 tons of bulbs, which are selected and transplanted in November with plenty of dung below them ; when the stems have shot about a foot in height in spring, I apply a little guano around the bulbs. The growing crop is carefully weeded of spurious plants, and the seed is as carefully protected from the birds. The stems are cut down when the seed is ripe and put into a stack, until the period of sowing the seed arrives. Turnip seed keeps best in the straw, and may be used when three or four years old, provided it be only threshed out just before it is sown. I only sow from 1 lb. to 1½ lb. of this seed to the acre, because it facilitates the operation of thinning, prevents the spindling of the plants, and secures them from becoming puny. It is of the utmost importance to have Turnip seed well harvested, and well preserved afterwards, whether in the pod or stack, or after being threshed out and cleaned. Turnip seed damaged in the harvesting will either not germinate at all, or the plants will be long of brairding, or they will be always puny and unthriving."

ON THE MANAGEMENT OF MANURE.

Your correspondents "C. L.," Cirencester, and Dr. Voelcker (dating, singularly enough, from the same place) have been engaged in the discussion of what once was a question much canvassed by agricultural men, namely, the loss of ammonia sustained in the decomposition by fermentation of farm-yard manure.

I am not going to enter on the arena as bottle-holder to either party ; I am rather to suggest that this is a question which, once of interest and importance, is now narrowed to a very small compass indeed, inasmuch as, under any circumstances, there is but a very small proportion of the manure made on a farm which there is any cause (or rather any excuse) for subjecting to the fermenting process. The different plans adopted by those skilled in the science and practice of agriculture for the restoration to and incorporation with the soil, without waste, of the residuum of the vegetable substances consumed by live stock, and of the straw used as litter, are these :—

1st, The plan now general over the better-farmed counties of England and Scotland, of ploughing in fresh manure on the autumn stubble, in preparation for the succeeding green crop. 2d, The Myer Mill plan, which is also, if not general, at any rate now practised by one or more in every district, of liquefying the whole exuviæ for distribution by steam power and iron pipage over the land. 3d, The plan explained by Lord Kinnaird in last number of the "Royal Agricultural Society's Journal," supported by most conclusive evidence of its being a profitable one, of having the manure made in covered court-yards. I use the word "made" advisedly, because his lordship's experience shows that it can be at once carted to the field, and spread in drills even for Potatoes.

I can testify to a similar result attained in my own practice. The droppings and solid litter of stall fed cattle, and the same from the work-horse stable, are daily thrown into a walled and covered pit, care being taken that they are intermixed. A dozen feeding pigs are kept in the pit ; any loose litter there may be found lying about, together with road scrapings, and odds and ends of animal and vegetable refuse, are thrown in ; the pigs mix and incorporate the whole well together. From time to time liquid from the manure-tank is pumped in ; and thus we have generally a deposit of a considerable quantity of well-made manure at hand, to supplement the dung-heaps when they are exhausted. These (the dung-heaps) are managed on a system which is simple and efficacious, but which I have not seen described in any agricultural publication. I must premise that not having attained to that plethora of muck and fertility when the spring and summer manure can be reserved, to be ploughed into the stubble for the succeeding green crop, I find that my summer and autumn collection is required for the Wheat brake, which I am fond of having large. My winter and spring collections are drawn upon for Potatoes and Beans, while my Turnip crop is raised almost entirely by portable manures. Thus, while there is no reserve on which interest is lost, there is a necessity for preparing the box-made manure for speedy use. This I effect by carting out the manure as the boxes become full, throwing it out of the carts into a heap of 5 feet in height by 12 feet broad. As we advance in this building we follow with a cover to the top and sides of clayey mould. This cover is at first about 6 inches thick. The still open side, to which we are adding, admits a small degree of atmospheric action, which induces a gentle heat. When this has gone on for three or four days, we add 3 to 6 inches more clay or soil, over which we pour dilute urine. This keeps the fermentation going on in the heap, the gases from which have to permeate the clay ere they can reach the atmosphere, and the now well-known absorption of ammonia by aluminal earth prevents any waste. Indeed, with manure taken from covered boxes, there will not be any escape of vapour from the clayey covering till the dilute urine is plentifully applied ; even with manure made in courts, exposed to rain, there will be an escape of nothing but of watery vapour, a loss which is a gain, as there is less weight afterwards to cart on the ground.

In ten days after the heap has been made, it will, if it has been properly attended to as above, be fit for using in Bean or Potato drills, being soft and unctuous ; it is cooked in its own steam. Should it not be required for a month or longer, all that is necessary is to give it a coat of 6 inches more clay or mould, and it stands ready to be cut up when wanted. I find this system to work exceedingly well. I am satisfied that from 70 loads of manure, carted out and covered with 30 loads clay, I have a larger store of fertilising elements than I should have from 100 loads of similar manure carted out and trenched up in the old mode to ferment. In this estimate I reckon only upon the elements over which I had a *quasi* control in the manure, little or none of which I lose ; but I am inclined to believe that together with this great advantage I obtain another of no less magnitude, in this, that I have set agoing a process by which I obtain an unbought store of nitric acid. This process is somewhat obscurely adverted to in Mr. Nesbit's letter, appended to Mr. Pusey's paper on "the Nitrates," in last number of the Royal Agricultural Society's Journal ; it was thus elucidated, 10 years ago, by a writer then almost a pioneer, still holding a foremost rank in agricultural chemistry. "The quantity of nitric acid which is formed (in the artificial nitre beds of France) is much greater than could be produced by the oxidation of the whole of the nitrogen contained in the organic matter present in the mixture. Organic matters are in our climate necessary to cause the formation of nitric acid to commence, but after it has begun it will proceed in the same heap for an indefinite period, and at the expense apparently of the nitrogen of the air only." (Johnston's Lectures on Agricultural Chemistry, pp. 242, 243.)

These last words afford the clue to the mode in which a plant, alike gluttonous and wasteful of nitrogen (it uses much and wastes more, see Rothamsted Experiences) as the Wheat, has been made to flourish without the application of manure, on the Lois-Weedon system. The 3 feet interval, uncropped and much cultivated, forms, so to speak, a trap, in which the ammonia and nitric acid, ever present in the air, are caught, and held at the service of the growing plant.

I purpose, hereafter, to inquire, by the light of Professor Anderson's very complete series of Analyses, published in the "Highland Society's Journal," how far some of our cultivated green crops serve as abstractors from the atmosphere, and safe custodiers of aërial nitrogenous matters. *S.*

Home Correspondence.

Blood as a Manure.—As Mr. Way observes, "this manure is disregarded." This is true in point of practice, but not so in the knowledge of the scientific farmer ; the fact is, we cannot obtain it ; it is a most invaluable manure, and we know by the application of blood absorbed by ashes, and road scrapings, soot, &c., drilled with Turnips and for Wheat, the yield of the latter was 40 bushels an acre, and the Turnip crops magnificent. If slaughter houses were provided with large tanks to receive the blood and ashes, soot, &c., mixed with it, any farmer would be glad to give 10*s.* a cart-load, if not more, for so valuable a manure, much of which finds its way into our rivers. All gardeners know the value of blood when applied to the roots of the Vine. *Alexander Falconer, Hants.*

Fish Guano.—In a late *Gazette* I regret to see such a prominent place given to that most nonsensical of all nonsensical nostrums, fish guano. So long as this "fish broth" palaver was confined to agricultural *savans* of Dublin, I did not think it worth while to raise my humble voice against it, but now that you have thought proper to treat us in your last leader to a re-hash of this Irish (fish) stew, I must protest against any more of your space being occupied with the subject. Only think for a moment of such folly as going to sea to catch fish, the best and most nutritious food in the world, and then to throw away the "bird in the hand" to raise Turnips, or other green crops, to feed bullocks for beef, which beef, I maintain, is not one whit better for food than the fish. Let us hope, then, that for the future you will leave the poor fishes to feed the poor people, for which there cannot be a shadow of a doubt they are and were created ; and I need not tell you the consequence of violating any fundamental law of nature. *J. Walker, Rockingham, Boyle.* [We have heard of no proposal for the conversion of *edible* fish.]

Meteorology.—I have read with much interest "R.'s" review of Professor Dove's maps of "The Distribution of Heat over the Surface of the Globe." Having for some years paid much attention to the subject of meteorology, and to the connection between the fluctuations of the barometer and the veerings of the wind, I become more and more strengthened in the conviction of the universal application of the truth of Mr. Redfield's "Rotatory Theory." I can say most confidently, that all the facts that have come under my notice are consistent with this theory, and that even those which at first sight have puzzled me the most, on inquiry support the truth of it. In reference, for instance, to R.'s snow storm of January last, I should like to see the barometrical observations taken by him four times a-day at Strathdon. To judge from R.'s outline, it might be supposed they were not taken between the 3d January and the 5th ; nor again between the 6th and the 8th. The wind, however, veered pretty regularly from S.E. to E.S.E., E. and E.N.E. This coincides with a rotatory storm passing up the British Channel, over Ushant, Kent, and Heligoland. The S.W. current, simultaneously noticed by "R.," would be the exterior of the rotatory storm at that time prevailing to the westward of Ireland; but as I have no materials for proving such actually to have been the case, I content myself with saying, that whenever I have had the opportunity of testing a southerly wind with a falling barometer on the coast of Ireland, there has been a northerly wind blowing on the Atlantic, 20, 30, or 40 degrees off, with a rising barometer. *F. P. B. M., Oxford and Cambridge Club, London.*

Management of Ewes.—I noticed in the *Gazette* for March 19, 1853, page 187, a prescription for an application for ewes after hard labour, and consequent inflammation of the womb, which I took care to copy, and have used this season with such success that I feel it a duty to my brother-farmers to add my emphatic testimony to its value. I feel very thankful to Mr. Summers for giving the results of his experience to the public. The treatment consists in a copious bleeding, and the administration of a dose composed of 2 ounces Epsom salts, two drachms ginger, and two drachms laudanum. We give this to all ewes which have to be handled in delivery, and my shepherd has told me to-day that it is his settled opinion that it has been the means of saving seven or eight ewes, which under the old system of treatment must have died, as well as tending very materially to the speedy recovery of others which, though not in danger, were considerably exhausted. My plea for troubling you with this communication must rest on my conviction that each should contribute his quota of useful information to the given stock. *T. R. Ellis, Oxnead Hall, Norfolk, March* 6.

Land Agents.—As this subject forms a prominent feature in the *Gazette* of January 28, I am induced to hazard a few remarks on it, feeling with your correspondent "B." that it is of the greatest importance both to the progress of agriculture and the welfare of a large portion of the community, namely, those connected with the soil. That it has been always abused no one can for a moment deny, and unless the attention of landlords be drawn to it through the medium of your valuable Paper, I am afraid it will still continue so. The first question in treating on the subject which naturally suggests itself is, What is a land agent? To this I would reply, he is one who stands as a medium between landlord and tenant, who is supposed to act as the mouth-piece of his employer, one whose duty it is to hold the welfare of the tenants as much at heart as the interests of his employer, and who should be thoroughly acquainted with all the minutiæ of his office. Judging from the number of applicants when such a situation is vacant, the duties of the office are easily acquired ; to dispel this, we must look at the different candidates, and as "B." justly remarks, we shall find some deserving in the highest degree, others who deem themselves deserving, and others again who have not the slightest pretensions but covet the appendages ; and oftentimes it happens that through interest or some unknown influence, the one who is the least capable of filling the office gets the appointment. Is it a wonder then that we find such discontent manifested amongst the agricultural classes in different parts of the country ? Let any person who lives in a discontented neighbourhood, look about him and see if he cannot trace the origin ; let him first see whether the farmers are directly under the eye of their landlord or his agent, then let him see if either the landlord or his agent is a practical man. I would venture to say that in most cases the discontent arises from one of the following causes ; either the landlord or his agent are not practical men, or the agent is a practical man, but has not sufficient power granted him by his employer; the latter I hold to be as injurious as the former, and in such a case the agent deserves the pity of every one, for he only has to bear the blame, the public of course looking to him for the remedy. Go into any district where there is a practical agent and see the difference—there the tenant goes on contentedly ; he has confidence in his landlord, he feels the agent has his interest at heart as well as his landlord's, and remains at home attending to his business, and reaping benefit from so doing. Having said this much, I will now draw attention to the agents themselves, and see what qualifications they ought to possess—they should be gentlemen thoroughly conversant with accounts, also with the valuation of land, farming, management of woods, and valuation of timber, draining, and building. It would be useless for me to say that all these qualifications are held by agents generally, for perfection seldom falls to the lot of mortal man, but these are a standard to go by, and should be considered before an appointment is filled up. In your leading article you draw attention to the diploma given by the Royal Agricultural College, and advocate it as a mark to denote proficiency as an agent, this in my humble opinion is all very well as a mark of general knowledge, but I much doubt if it ought to be held as a criterion of thorough practical knowledge. Theory is absolutely necessary, but if it is not combined with practice, little good results from it, hence arises oftentimes those enormous displays of outlay in farming from which no real good can arise, but in reality injury, since they tend to frighten by their failures those who would otherwise be disposed to take the medium course. Not only should all the subjects of these different classes at the college be studied by the practical man, but he should move about and see and judge for himself before he is intrusted with the management of

property. I believe that a man who has been brought up beyond the reach of these great agricultural schools may make just as efficient an agent as one who has studied at them, provided he has practically followed up the different requisites I have alluded to before as being necessary for an agent to possess. Before concluding, an allusion to one great error which landlords often fall into may not be out of place, that of intrusting the management of their property to lawyers; what can they know of management of land or anything belonging to it, except drawing up leases or agreements? It is nothing more than an infringement on the rights of others for an attorney to become a land agent, he is taking away the bread from a class of men who cannot retaliate; he must employ men to superintend the different works, and hence arises often, as "B." remarks, distrust on the part of the tenants and sundry disputes which must in the end prove detrimental to the property; and how often for these causes does a landlord, himself as good a man as ever need be, sink down into a mere nonentity, and be looked upon as one to be avoided by farmers on the look-out for estates. *M.*

Sewerage as Manure.—At a weekly council of the Royal Agricultural Society, held at its house in Hanover Square, on the 29th of June last, an interesting discussion on this subject took place. Professor Way stated his views on the management of the sewage matter of towns, and its agricultural application, and he was followed by several other gentlemen, whose remarks, though conflicting and somewhat opposed, possess much interest, and may lead to discoveries of practical utility. It will be curious to notice the bearings of each line of argument, on a subject as yet theoretical, but which ought to be susceptible of absolute proof, if analytic chemistry has indeed attained that degree of refined acumen to which the science of the day lays claim. The point now at issue is the condition—liquid or solid—in which sewage ought to be applied to land, in order to produce its utmost fertilising effect at the lowest expenditure of money. Professor Way said that, "at present he was aware of no method to convert sewage into solid manure that would pay." He then detailed the various substances proposed for the filtration of sewage, and the various precipitants to effect the subsidence of its grosser matters; and referred to the plans of Higgs, Moffatt, Wicksteed, Herapath, and others; to the peat-charcoal filter of the Sewage Manufactory Company at Fulham; and to the other numerous appliances recommended. The mention of Higgs and Wicksteed becomes interesting to an inhabitant of Croydon, where each of these gentlemen has been consulted in order to effect something which may at least tend to sooth the public mind, rendered sensitive by the results of certain measures carried through with too much haste. In respect to the lime process, or an attempt to clarify the liquid sewage by "a milk of lime, which is made by putting into a cistern a certain quantity of lime, and adding thereto a definite quantity of water," it is only needful to observe that, since Mr. Rowlandson made public his experiments with lime, it has been proved to demonstration that manure-water, the drainage of dung-hills, and the like, are deprived of colour, odour, and, to some extent, of taste, by a very small addition of slaked lime, milk of lime, or even of strong clear lime-water, which, by attracting and fixing the humic matter (called acid), carries it down in the condition of dingy grey flocks. Mr. Wicksteed's processes are partially described in a small pamphlet published in 1851, and headed "Patent Solid Sewage Manure." "The milk of lime in Higg's process," Mr. Way said, "clears the sewage from colour, but leaves in it nearly all the organic matter. He would prefer separating the sewage matter by itself, but even that would only contain from 2½ to 3 per cent. of ammonia, and would not pay. Generally speaking, the distribution of liquid manure, to be fully available, should be effected on an extensive system; it was ridiculous for a place like Edinburgh to supply liquid manure for only a few thousand acres; such matter ought to suffice for hundreds of thousands of acres." I am constrained to abbreviate, and therefore can only just glance at the opinions of Messrs. Chadwick and Mechi. Mr. Chadwick was of opinion that where there were means to apply liquid manure in that form, it was mere waste of expense in labour and material—of the materials used in the process as well as of the manure itself—to reduce it to the solid form, from which it must again be liquefied; in that state of merely mechanical suspension, chemical experiment had proved that the fertilising matter would be confined and safely stowed in nature's own laboratory—the soil. Mr. Mechi, referring to Professor Way's paper on this very subject—the power of soils to fix ammonia—stated that, "in strong clay soils, he had, whilst irrigating, caused the drains at 5 feet depth to discharge manure-water having colour, smell, and fertilising properties, although he had hoped that all these things might have been arrested in the soil." Here, in this last part, we observe an instance of over saturation. Ground cannot be made to absorb beyond its capacity. In Croydon there still exists a lamentable example of this sad truth. As to the precipitation of sewage matters by lime, or by other agents, its profitable attempt remains to be proved. So far, all experiments on a broad scale have been unpromising. How far great improvement in our barren commons (like Banstead Downs, for instance) might be effected by floating with sewage, is a question that was recently proposed in my hearing. Who can solve it? Yet matters of deeper moment, and quite as improbable, have been satisfactorily carried through. *J. T., Croydon.*

M'Gillvray's "British Birds."—At p. 143, vol. i., is a long quotation from an old author, who writes in Latin an account of the birds of Scotland. Amongst the rarer sorts he describes the cock-of-the-wood, and the "grouse, which feeds upon Broom-tops, and the black-cock, which eats corn." "This," says Mr. M'G., "is a lame account of the matter. If the very learned man had possessed a tithe of the knowledge of one of our modern rustics, he might have known that the black-cock no more feeds upon corn than the muir-fowl upon Broom-tops." Before we are severely critical, we ought to be sure that we are strictly correct. Now, any modern rustic, any cowherd laddie, in this county (Dumfries), can tell you that the black-cock is one of the greatest corn-destroying pests of the muirland farmer, who suffers ten times as much from the grouse and black-cocks as from rooks and wood-pigeons. Last harvest, which was unusually late and protracted upon many farms situated in the high-lying districts of Annandale, Eskdale, Liddesdale, and Teviotdale, the grouse (black and red) destroyed fully one-fifth, some said one-fourth, of the Oat crop. To protect their crops, many farmers employed "herds," who were kept on the trot—"from morn till noon, from noon till dewy eve"—driving off these privileged marauders, who when driven from one row of stooks would alight on another, not 100 yards off! In one field I have counted 40 black-cocks, and twice as many muir-fowl. A friend of mine, located near the head waters of the Esk, whose fields cover a considerable space, last harvest had three herds—two callants and a lassie, the last the best of the party, whilst possessing all the activity of the boys, she "gave tongue" much more freely. *Missel Thrush.*—The old and generally received opinion that seeds are distributed by means of birds is disputed—the author upon dissection never, excepting upon two occasions, having found undigested grains in the intestines of birds, and which he conjectures may have been occasioned through disease. "The gizzard of the thrush is sufficiently powerful to grind into paste the seeds of any fruit which it may eat." Hardish work, one would think, when the fruit happens to be Cherries, Geans, and Haws. Why object to the bird method of distributing seeds? though a less direct, it is an equally natural mode. The Elm, Ash, Birch, Alder, Plane, the Thistle, and Dandelion, are furnished with wings to their seeds, by which they are carried to soils and situations fitted for them. The seeds of the Cherry, Gean, and Haw are conveyed to situations fitted for them by the wings of the bird which eats their fruit, but cannot grind to paste the hard stones which protect the seeds, and thus pass through undigested. One fact, is worth a bushel of arguments, from analogy; I send you two. Packet No. 1 contains the droppings of a black-cock, in which you will find *in situ*, as a geologist would say, sundry seeds of the Haw; No. 2 contains the droppings of a thrush, blackbird, or fieldfare (I cannot say which, as all three sorts were feeding upon the Haws of the tall hedge, at the bottom of which I picked up these). The droppings of the thrush, being less consistent, does not make so satisfactory a specimen as the former. The superior polish upon the stones of No. 1 proves, as might be expected, the gastric juice of the grouse to be much more powerful than that of the thrush. *Rooks*, p. 541, are acquitted of digging "sets" out of Potato drills; and the failure of the crop attributed by the author to "the stupidity of the farmers," who will cut the seed instead of planting the Potato whole! I have 50 times seen the rooks carrying off the Potatoes in their bills, both at planting time and when the sets were beginning to braird. From the time the young Potatoes are of the size of a pigeon's egg until the crop is taken up, I employ a crow-herd every season. Upon one occasion, three years since, when that functionary happened to be from his post for part of a forenoon, the rooks observed his absence, and so well plied their time that, next morning, besides what had been eaten and carried away, 5 bushels of Potatoes were gathered from the drills, which had been dug out by the gentlemen in black! *J. L.* [The specimens sent perfectly bear out what is said of them above.]

Plans of Drains.—Permit me to call your attention to the necessity of advocating in the columns of the *Agricultural Gazette*, "the great utility of preserving in all cases plans of land drainage," recording thereby the exact position of the drains, in order that any defects in the work, which frequently occur, may be easily and cheaply rectified. I am convinced, however, that this has seldom been adopted, and it is generally impossible after a very few years to gain any correct information as to the direction of the drains, and frequently the outlets are choked up and cannot be discovered, thereby causing the drainage to be of little or no effect. *John Johnson.*

Societies.

ROYAL AGRICULTURAL SOCIETY.

Weekly Council, *March* 8.—Mr. Pusey, President, in the chair.

Oil-Cake.—Mr. Hudson, of Castleacre, transmitted to the Council the following communication, dated the 6th instant:—

I regret very much that I cannot attend the Council Meeting next Wednesday, in consequence of a business engagement, as I feel greatly interested in the discussion which I understand is to take place that day upon the subject of the adulteration of Linseed-oil cakes by the English crushers. Having myself an oil mill, and having made as much as 100 tons of cake in a season for my own use, I know something of cake making; and I beg to differ with those gentlemen who stated, at the Council Meeting of the 8th of February, that the English cake was more adulterated than the foreign. As far as my experience goes, the contrary is the fact. I purchase my Linseed of Messrs. Webber and Hedge, of Lowestoft, who have a very extensive oil-mill there, with most beautiful machinery for cleaning the Linseed, and taking out almost every seed as well as dirt from it. This I cannot do in my small mill, not having the machinery for that purpose; therefore I prefer purchasing my Linseed of them, because I get it perfectly clean and free from wild Mustard and other bad seeds. I also purchase a considerable quantity of Linseed cakes of them, knowing their cake to be pure, and free from noxious seeds; whereas, a great deal of the foreign cake is foul, and of very inferior quality.

Professor Simonds laid before the Council a variety of specimens furnished to him by Messrs. Webber and Hedge, of oil-cake manufactured by them, as well as samples of the seed from which the oil was expressed, and of the oil itself.—Mr. Capel Cure transmitted a specimen of oil-cake of very heterogeneous appearance, purchased by him as Ground-nut cake.—A discussion then ensued, in which the President, Mr. Fisher Hobbs, Mr. Woodward, Mr. Raymond Barker, Col. Hall, Prof. Simonds, Mr. Cuthbert Johnson, and Mr. Wrench took part, on the excellence of English oil-cake of high price, but of the inferiority of that of lower price, and the increasing adulterations taking place in these articles; on the evil arising from the practice of giving names to oil-cakes, which their composition and quality did not justify; on the competition among oil-pressers, leading to the employment of inferior seeds for crushing; on the pureness of the Linseed kept in France and America, for the expression of Linseed-oil, and the inferiority of seeds and husk-refuse sent over to this country for purchase by oil-cake makers; on the numerous instances that occurred of the death of animals feeding on these deleterious compounds (though termed "Linseed-cake" and "Rape-cake" in the market where purchased); on the detection of these heterogeneous ingredients by means of microscopical investigation; on the President's continued successful use of Rape-cake (of pure quality) for sheep.

Foreign Barley.—Mr. Barnet, of Stratton Park, transmitted specimens of a foreign Barley, grown on his estate in Bedfordshire, along with the following memorandum:—

Barley grown by Mr. Winters, Stratton Farm, Biggleswade, picked from a field sown with foreign Barley; yield greater than English Barley; but its best quality is that it decidedly is of superior weight and quality on clay land compared with different sorts of Barley that have been tried on the same land. Of course on real Barley land the quality is the best. Only a few ears were found in a field of many acres first sown with the foreign Barley, strong in the straw, and does not fall, requires to be cut before it is dead ripe; has been malted, and proves of very good quality; not known where the foreign Barley came from.

Adjourned to March 15th.

Poultry.

Ptarmigan Fowls.—As I have of late both seen and heard a great deal about the Ptarmigan fowls, I shall be exceedingly glad if any of their admirers will now come forward and inform me what are the chief merits of this breed. I confess that I have yet to learn that it is so great an acquisition to our poultry yard as many state it to be, in which opinion I am confirmed by observing how small a share of notice it has obtained at several of our exhibitions; and before anything is said relative to its excelling (as some have been bold enough to assert), I think we have yet to learn why it can even be placed on terms of equality with by far the major part of our different breeds. Is it so good a nurse as the Cochin China? Does it present so noble a breast as the Dorking? Will its plumage suit the smoke of a town as well as that of the Spanish? Is its carriage as noble as that of the game cock? or is it so good a layer or so pretty a bird as can be found amongst either of the varieties of Hamburgh or Poland fowls? When it has been proved that it can equal any one of the above-mentioned varieties, then, and not until then, is it entitled to be considered an acquisition. I know many of the readers of "Poultry" in your Paper will be equally glad to learn whence these birds were first derived, and to hear it proved that they are a distinct species; as at present many entertain the idea that they are merely a degenerate variety of Polands. *Proof Seeker.*

Poultry: *An Amateur Poultry Fancier.* If the nests be kept fresh and clean, we cannot imagine why the eggs are in the state you describe.

Miscellaneous.

Improved Machinery for Raising and Stacking Straw, Hay, Corn, and other Agricultural Produce. By J. Hayes, of Elton, Huntingdon. Patent granted June 3, 1853. (No. 1369).—The inventor describes and claims apparatus composed of a travelling endless strap, which carries a series of plates placed at right angles to its surface, and which travels over suitable rollers, fixed in a light frame, which is capable of being elevated as the height of the stack increases. The strap is driven by a handle or handles, or in any other suitable manner. When the apparatus is in use, the hay or other substance is placed on each plate as it passes upwards, and being carried up by the plate to the top of the frame, is thrown upon the stack, as the strap carrying the blade passes round the upper roller, in order to descend down the back of the frame. *Mechanics' Magazine.*

Calendar of Operations.

MARCH.

Border of the Fens, *March* 7.—Last year we were surrounded by all the obstacles of winter, no spring operations in progress; those who had delayed their Wheat seeding, unable to get upon the land; Beans, Oats, Barley, and Potatoes, alike suspended, and

nothing done, with rare exceptions, but hedging and manure carting. What a contrast to the present season, for nearly two months we have now had uninterrupted fine weather, with frosts enough to mellow a brick yard, and with drying winds and sunny days superior for fallowing land to any ordinary summer; field after field has been completed, and those who have taken care not to sow their seed until the bed is in a proper state to receive it, may look forward with confidence to a successful issue; but we have noticed some persons who have been too eager, sowing Oats the first week in February, not because their land worked well, or because it was clean, but because the weather was fine. We foresee in such cases much additional trouble provided, when the mild growing showers of spring come, from the rivalry of weeds. Here we are in the first week of March hardly knowing how to distribute a full complement of horses and men, so as to take the utmost advantage of such wondrous facilities as the late glorious sunshine has afforded for ameliorating the heavy soils, cleaning the foul, and getting in Oats and Barley unusually early, and all the while, as far as we can ascertain, the Wheat plant accustoming itself to cold nights, assuming a strong and healthy aspect, promising a vigorous youth, which we hope may end in an early and fruitful maturity. A few pieces of Wheat have suffered in low situations, or where shaded by trees, or exposed to a northern aspect, from the great length of time the snow lay on the ground, as well as by the slow disappearance of it from places not accessible to sun or southerly winds, but the Wheat plant generally is strong and healthy. Next to the preparation of land the lambing season takes a prominent place, and, as far as we can ascertain, also proceeds favourably; the fall of lambs among the Lincolns and Leicesters commences about the 1st of March, and has hitherto been remarkably good, plenty of couples, and few fatalities. Turnips are getting short for the lamb hogs, which, however, appear to be doing well. Store beasts are somewhat lower in price, as well owing to the scarcity of hay as to the remarkably high price of good Linseed-cake. If our differences with Russia are likely to continue, some of our fellow-labourers should sow Linseed, or a premium be offered for a wholesome substitute for cake; as unless Linseed and Linseed-cake should be obtainable in tolerable quantities at some price, farewell to the lamentations of political economists as to the unwieldiness of bullocks; fat will be at a premium, and those who make fat will indeed make it to their own cost. Invention seems to have spread among agricultural commodities, not only in efforts to supersede manual labour and old machinery, but to run a race with guano till we are likely to be inundated with nitrates and phosphates, and combinations of lime and ammonia, with a long tail of chemical cognomens that attract the eye and tax the credulity of the wondering "experimentalist." In the meantime, the value of land rises and wages advance, so that it behoves the careful husbandman to look well to the necessities of his situation before he ventures too far into the specious schemes of such a crowd of ingenious projectors, land doctors, and soil distributors. *J. W., Peterborough.*

South Hants, *March* 3.—Farmers have been making vast strides in out-door work—much land has been run back which the present frosts will benefit. Peas and Beans have been sown in large quantities, but we object to the large breadths sown, unless the land be clean. The last state of the land after this crop is miserably dirty; besides, slugs are very prevalent in the land after leguminous crops, and the consequence is, there is but half a crop of Wheat: this remark does not apply to superiorly managed as well as manured farms. The Bean crops have been ploughed in and drilled; the former plan the best, even better than the dibble. Sheep have improved much during the late dry weather; and Turnips are disappearing fast, and yet there is a hard time coming. The Wheats are much improved, but the later sown do not resist the late frosts so well. Much of the Wheat plant has been rolled; the land is actually dusty on the surface. *R. T.*

West Sussex, *March* 6.—We have now for a long time had the weather the very thing that we could have desired, and all our care has been to make the most of it. For a great part of February we have had the dust flying behind the harrows. The land—even the most stubborn—has been well pulverised upon the top by the winter frosts; but yet when we plough across that which looks so well upon top, we find it is still very raw below; and if it were possible to get all the land intended for Turnips turned up soon, it would be much the better for it. For if it is not turned up to get a little sun it will be far from healthy, as the bad effects of the past year's heavy rains have by no means been yet rectified. Wheat does not at present appear so vigorous as we might have expected from its previous appearance; but we may account for this by the cold and frosty nights we have had, and when we have it warmer we shall soon find an agreeable change. Grass begins to look a little fresh, but from the causes above described is not far advanced. Our crops of spring Beans, Peas, and Oats are all in, and have required far less labour than we can generally count on at this time of the year. There has been a little Barley sown, but there is yet some extent of Turnips to cut off before it can be finished. The ewes and lambs have generally done well and are going over the Turnips without working them, as is the case in a wet season. But the Turnips which have been but a poor crop will be done sooner than usual, and may throw some of them on the market sooner than is convenient, while those who keep longest are likely to get best paid. Wheat, Clovers, &c., are now claiming our attention, especially as the land was previously so wet, it is more likely to crack with rapid drought; but if the dry surface is well pressed down, it will prevent the too sudden action of the sun, and thus let it dry gradually. *G. S.*

Notices to Correspondents.

Barley for Pigs: *Woodside.* One of the best plans is to strew the meal over steamed roots, and mash and knead the whole up together. For cattle, it may be strewed over chaff on which plenty of hot and salt Linseed soup has been previously thrown.

Irish Moss: *J B H.* Can any of our correspondents say, from experience, what quantity of Irish Moss may be given "a horse rather touched in the wind, and if it should be mixed with Linseed or what?"

Oats: *E Townend.* It is not necessary to kiln dry them before crushing. A good corn-bruiser will sufficiently reduce them, although they be not perfectly dry.

Stoppage of Drains: *J C C.* Will our correspondent "A.," of February 27, say whether there is a perennial run of water through the drains which he found stopped by rootlets in Grass land, or whether the drains only run after rain falls?

Slugs: *R R.* If you can apply hot slaked lime on a dewy evening when the slugs are out, it may be efficacious. Sow it with a tin scoop, out of a seed "skep;" at least 10 bushels per acre.

Sulphate of Ammonia: *X Y.* We have applied it both to Wheat and Grass with good effect, using it at the rate of 1 cwt. per acre in wet weather in April, during the season of most vigorous growth. Dr. Newington has a hand manure-distributor adapted especially for powdered manures. Garrett's Blyth's broadcast manure-distributor is the best of its class. You must not sow seed and guano at the same time; the former would be injured, if not destroyed, by contact with the latter.

Top-dressing: *J B F.* In the absence of guano, mix 1 cwt. of nitrate of soda, 1 cwt. of superphosphate of lime, and 2 cwt. of common salt together, for application per acre, broadcast in wet weather. The same for Barley.

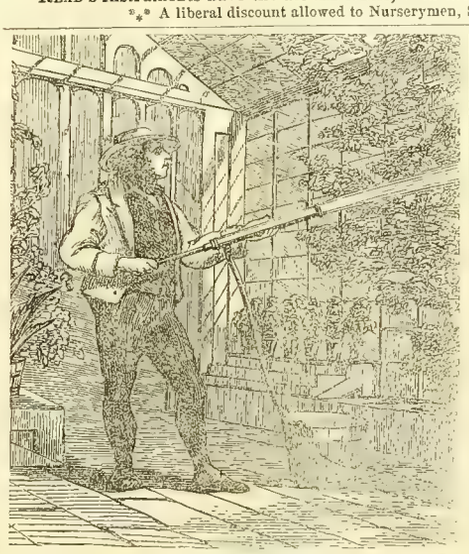
Turnips: *R R.* If the weather suits, you can get Turnips after Rape in one year—the former being sown in August, after the latter, sown now, has been eaten off. But unless the weather enables you to reduce the hard surface of the folded Rape soil, you are not likely to get much of a Turnip crop after it so late in the season.—Trifolium incarnatum may be sown now. It should have been sown in autumn; and the present loose and dry state of the soil is against it.

READ'S GARDEN ENGINES, SYRINGES, &c.

WHEN an article of real utility attracts public attention, Imitators start into the field to snatch from the inventor the just reward of his labours. It has now become a daily practice of exhibiting in the windows of ironmongers and others, Syringes of the very commonest description, with the words "READ'S PATENT," as an inducement to purchasers. This, as an eminent writer on Horticulture has recently remarked on the subject, is indeed "living upon another man's fame."

Read's Instruments have the Royal Arms, with the Address—**35, REGENT CIRCUS, LONDON.**

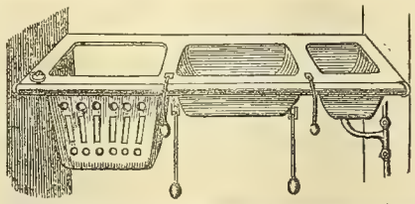
*** A liberal discount allowed to Nurserymen, Seedsmen, &c., &c.—Descriptions sent Post Free.



J. TYLOR and SON'S REGISTERED GARDEN SYRINGE.—By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. Price complete, with vulcanised India-rubber suction tube, with galvanised spiral inside, and covered with cotton outside, 25s. each. To be had of any respectable Ironmonger or Seedsman in town or country.

J. Tylor & Sons, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

BARTON'S PATENT STABLE FITTINGS, PLAIN, ENAMELLED, AND GALVANISED.



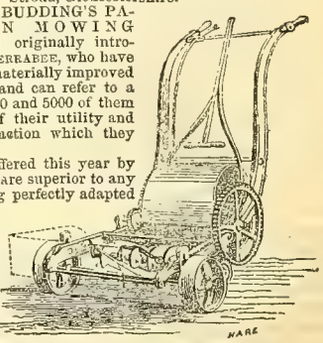
These fittings will be found to possess improvements in safety, economy, cleanliness, and convenience, and are highly recommended for their compactness and great durability. Stable Furniture of every description—Iron Gates, Railing, Strained, Wire Fencing, Hurdles, Sheep, Poultry, and Game Wire Netting, Registered Poultry Fountains, Feeders, &c.—James Barton, Ironmonger, &c., Warehouse and Manufactory, 370, Oxford Street, a few doors east of the Pantheon.

STEPHENSON and PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

THE IMPROVED LAWN MOWING MACHINE, MANUFACTURED BY

J. and H. FERRABEE, Phœnix Iron Works, near Stroud, Gloucestershire.



The well-known BUDDING'S PATENT LAWN MOWING MACHINES were originally introduced by J. & H. Ferrabee, who have from time to time materially improved their construction, and can refer to a sale of between 4000 and 5000 of them as the best proof of their utility and the general satisfaction which they have given.

The Machines offered this year by J. & H. Ferrabee are superior to any yet produced, being perfectly adapted for cutting the Grass on Lawns and Verges, and between flower beds; while their strength and durability have been increased and their management simplified. Any person can use them effectually without the least practice. They can be adjusted to cut various lengths of Grass, and will produce a more even and uniform surface than the most skilful mower. The Grass is cut best when dry, so that a machine can be employed at the most convenient time to the workman, and more than double the work may be done with the same manual labour that is requisite with a scythe.

Sizes and Prices.		£	s.	d.
Hand Machine, for One Man, cutting 16 inches wide		5	15	0
Ditto for Two Men,	„ 22 ditto ...	6	10	0
Pony Machine,	„ 28 ditto ...	10	0	0
Horse ditto	„ 36 ditto ...	16	0	0

The Horse Machine will cut the longest and coarsest Grass usually met with on Lawns and Pleasure Grounds.

London Agents:—Messrs. Boulnois & Son, Baker Street Bazaar, Portman Square.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. White & Brothers, Millbank Street, Westminster.

MORNING FROSTS.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1s. 6d. per yard run, of E. T. Archer, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey. (Removing in May next to 112, Regent Street, London.)

GREAT SAVING OF TIME AND MONEY.

R. RESTELL'S PATENT ECONOMICAL GAS APPARATUS for Forcing Houses, Greenhouses, Conservatories, Pits, Shops, Counting Houses, Warehouses, Drying Rooms, &c. &c., possessing all the advantages of Hot Water at half the expense of fitting, and most trifling cost for Gas, far surpassing any ordinary Gas Stove, requiring no furnace, and allowing of no fumes or evaporation in the Building, or possibility of accidents from negligence or carelessness. It has been tested through the late severe weather, on a variety of Plants, and found most satisfactory. It is very quickly fitted up and requires no night attention.—Apply to the Inventor and Patentee, R. Restell, 35, High Street, Croydon, Surrey.

Persons wishing to have Houses fitted will please to send the height and dimensions.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

FOREIGN GLASS, 16 ounces to the foot, of good quality, in boxes of 100 feet each, suitable for Horticultural purposes. Boxes included.

SHEET GLASS OF ENGLISH MANUFACTURE FOR ORCHARD HOUSES, THE SAME QUALITY AS WE SUPPLY TO MR. RIVERS, and of various dimensions, always on hand.

London Agents for the Sale of HARTLEY'S PATENT ROUGH PLATE GLASS.

Glass Tiles, ¼ of an inch thick, packed in cases, containing 50, at 1*l.* 17*s.* 6*d.* per case. Packages 2*s.* each extra, but allowed for when returned.

Glass Milk Pans, 21*s.* per dozen: Propagating and Bee Glasses, Cucumber Tubes, Lactometers, Lord Camoys' Milk Syphons, Wasp Traps; Plate, Crown, and Ornamental Glass, Shades for Ornaments, Fern Shades, and every article in the trade.

Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

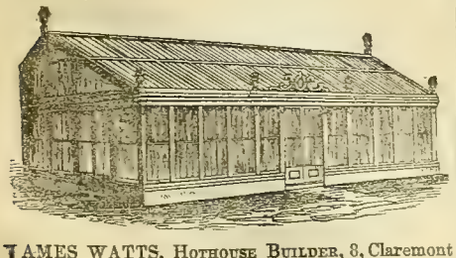
ALFRED KENT'S PATENT WEATHER-PROOF GLAZING WITHOUT PUTTY.—For Horticultural Buildings in Wood or Metal.

HORTICULTURAL BUILDING WORKS, CHICHESTER.

Illustrated Books describing inventions, containing prices and particulars relating to the different designs, sent on receipt of four postage stamps. Nurserymen and others appointed agents on application.

Horticultural Buildings upon this plan having been erected in many different parts of the country, and having stood the trial of all weathers, and more especially the severest of all, viz., frost, A. KENT, with full confidence, strengthened by the many flattering testimonials he has received, can safely guarantee the proper working of his Patent System of Glazing. Estimates and Plans sent, including Heating by Hot Water.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

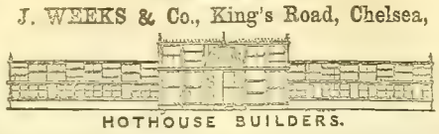


JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in. 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

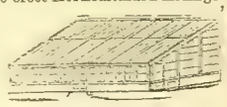
HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

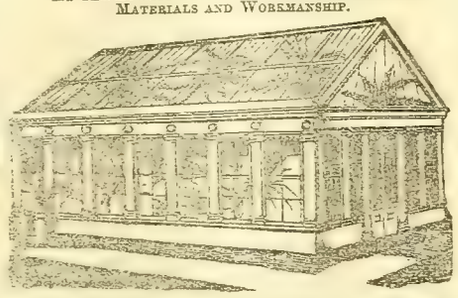
The splendid collections of Stove and Greenhouse Plant are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

GREEN AND HOTHOUSES made by machinery at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Warranted of best materials; being made by steam-power, they are put together in a superior manner; one trial will prove these Buildings to be the cheapest and best made in England. 1¼ in. Greenhouse lights at 3*d.* per foot; 2 in. at 4½*d.* per foot. Lists of Prices by enclosing two postage stamps.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent: these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

THE COTTAGER'S STOVE.—An economical, compact, and portable COOKING APPARATUS, combining a good sized Oven and Hotplate; may be had with or without a boiler, and will cook sufficient for a dozen persons with the consumption of 1 lb. of coal or coke per hour. It requires no fixing, may be placed in any apartment, and is a great security against accidents from fire. It will burn Coal, Coke, or Wood. They are also specially adapted for Emigrants, and may be seen in operation daily, at the Manufacturers', D. & E. BAILEY, 272, High Holborn, London.—Price 50*s.*, and upwards.

NETTING AND BUNTING FOR FRUIT-TREES, RICK CLOTHS, MARQUEES, TENTS, &c., NEW OR SECOND-HAND, FOR SALE OR HIRE.—BENJAMIN EDGINGTON has prepared for the ensuing season an extensive assortment of Marquees, &c., for Horticultural Societies, Fêtes, Cricket Clubs, &c. Rick Cloths, with poles, pulleys, and lines complete. A great variety of Emigration Tents erected on the premises, 2, Duke Street, Southwark. Warehouse, 32, Charing Cross.—Address, by post, 2, Duke Street, Southwark, London.

Lithographic, Chalk, Pen, and Colour, daily Teaching and Practice. Fee 4*l.* Superintendents, Mr. Brooks and Miss Channon. Marlborough House, Pall Mall.

THE LATEST DISCOVERY IN ELECTRICITY.

ELECTRICITY IS VITALITY, and when communicated in mild but continuous currents by wearing MEINIG'S patent portable GALVANIC ELECTRO GENERATOR, for personal use. All Nervous, Functional, or Rheumatic Diseases (where no organic change has taken place) disappear with a safety, certainty, and speed, which is as marvellous as it is demonstrable beyond the possibility of a doubt; for the prospectus contains the names and addresses of more than 400 persons cured within the last 18 months by this extraordinary agent, which is moreover adopted in all the Hospitals in this country and in France, and by the first men of the day. The effects being instantaneously perceptible, may be tested freely and beforehand. Price from 5*s.* upwards, according to power. A full description of this extraordinary discovery may be had (by post for two stamps) of C. MEINIG, 103, Leadenhall Street, London; or from the Agents for Liverpool, A. Abraham & Co., Opticians, 20, Lord Street.

N.B. In this new Apparatus durability is secured, and all metallic or wet contact with the body entirely obviated.

It weighs two ounces, and can be worn with the greatest comfort. MEINIG'S ELECTRO GENERATOR, when worn on the Liver, has been found a never-failing preventive of Cholera, supplying the central and hepathic system with vital energy, to resist and counteract all miasmatic influences.

ELECTRICITY FOR NERVOUS, FUNCTIONAL, AND RHEUMATIC DISEASES.

MR. MEINIG'S new and greatly improved GALVANIC ELECTRO REGENERATOR, for supplying vito-functional energy to any organ in want of the same, and to the system generally, may now be had at the Establishment, 103, Leadenhall Street. All wet and metallic contact with the body is entirely obviated; it acts with water alone, without acid, the action lasts more than 24 hours after each damping, and can be renewed and regulated without undressing, the Generator, enclosed in an envelope, being carried in the pocket or suspended from the neck. The extraordinary curative virtues of these mild currents of Electricity are now fully established by experience; the Prospectus (to be had gratis, or by post for two stamps) contains the names of more than 600 persons cured within the last 18 months, and this remedy is now adopted in nearly all the hospitals, and by the most eminent practitioners. Sold at 5*s.* upwards, according to power, at C. MEINIG'S, 103, Leadenhall Street. N.B.—It is impossible, when wearing a Generator, to be attacked by Cholera.

FARMS IN SURREY.

TO BE LET, about 200 acres of ARABLE and MEADOW LAND, with extensive rights of Pasture, in two Farms, with good premises, near the Gomshall Station, London, Reigate, and Reading Railway.—Apply to Mr. RAMSAY, Netley, Shere, Guildford, Surrey.

TO BE LET, a superior FARM, on the Bunny Estate, in the County of and 7 miles from Nottingham, and about the same distance from Loughborough, consisting of 387 acres, or thereabouts, with a handsome and commodious House, suitable in every respect as a residence for a gentleman's family, and comprising Entrance Hall, Breakfast Room, Dining Room, Drawing Room, five Bed Rooms, five ditto for servants, one Dressing Room, Housekeeper's Room, Butler's Pantry, Kitchen and Scullery, Larder and Dairy, Water-closet, &c., Cellars both ample and excellent. Also, a good Garden, Orchard, and agreeable Pleasure-grounds, all conveniently attached, The Farm Buildings, too, are both capacious and complete. The whole may be entered upon at Lady Day (first), and any further information, meanwhile, will be furnished upon application to Mr. JAMES ANDERSON, Farm-Bailiff, Bunny Park, near Nottingham.

COUNTY OF TIPPERARY.—BARONY OF LOWER ORMOND.

TO BE LET, from the 25th of March, with immediate possession, the following LANDS:—Ballylina, West Farm, containing 140 acres, Irish; Mathew's Farm (part of Ballylina, W.), 62 acres; Castleview Farm, ditto, 105 acres; Lismalin Farm, 190 acres; Ballynahinch Farm, 82 acres. These Farms are on the Estate of Lord Ashtown, and are situated about eight miles from Fortumna, to which there is water-carriage; and the nearest station on the Parsonstown Railway, now in progress, will be at about six miles distance.

The Land is suited for tillage under the 4 or 5-course rotation. There are good slated houses on three of these Farms; and any other buildings, which may be reasonably required, will be erected by the landlord. Mr. JAMES EGAN, the Steward, at Sopwell Hall, near Shinrone, will show these Farms.

TO NURSERYMEN AND OTHERS.

TO BE LET, about 45 Acres of GARDEN and NURSERY GROUNDS, planted with Fruit Trees and Plants, with two Residences thereon, containing several rooms, with barn, stable, and other outbuildings, in Essex, about 45 miles from London and 2½ miles from the Braintree Railway Station, and near to Witham, on the Eastern Counties Railway, at the very low rent of 100*l.* a year.—Apply to Mr. AMBROSE, Solicitor, 7, Manchester Square, London.

TO BE LET, at Lewisham, Kent, a Six-roomed HOUSE. Rent 21*l.* per annum.—Enquire personally (not by letter), of Mr. PALMER, 3, Exchequer Place, Lewisham.

TO NURSERYMEN, GARDENERS, AND OTHERS.

TO BE SOLD, a NURSERY and FLORIST BUSINESS in the Neighbourhood of London (with a good connexion of jobbing). To a person acquainted with Plant-growing, this would be a good opportunity to commence business. Terms moderate.—Apply (by letter only) to Mr. HENRY MITCHENER, Printer, 3, Edward Street, Hampstead Road, London.

A FORTUNE TO BE MADE IN A SHORT TIME.

TO BE SOLD, Three GREENHOUSES and PLANTS, or to be taken at a valuation or private contract, with sundry other useful things, Frames, a Pit, a quantity of Stocks, Tools, Mould, Manure; together with House and Fixtures, or without the house, at a low rental, with immediate possession if required.—For further particulars, apply at 6, Alpha Road, Regent's Park, London.

TO BE SOLD CHEAP, under very particular circumstances, an ELEGANT FOUNTAIN, and two pair of large GRECIAN VASES, on Rustic pedestals.—Apply at the Artificial Stone Works, Clayton Place, Kennington Oval.

AYLESBURY DUCKS' EGGS.

TO BE SOLD, EGGS warranted from the best selected White Ducks, good shape, bill and legs fine and a good colour, 6*s.* per dozen, including packing. Early application to secure them at the above price is necessary.—Apply to WILLIAM HENRY GREEN, Builder, Walton Street, Aylesbury.

COCHIN CHINA POULTRY, ETC. EGGS FROM PRIZE BIRDS.

MR. JOHN FAIRLIE, of Cheveley Park, Newmarket, in reply to the very urgent applications from numerous amateurs, is now prepared to dispose of a limited number of Eggs, from his celebrated prize Cochins, Brahma Pootras, Scotch Bakies, Dorkings, &c., according to the dates of the orders received.

TO BE SOLD, EGGS and FOWLS of the following sorts, all warranted:—Brahma Pootra Eggs, Black Cochin Eggs, Buff and White Cochin Eggs, all first prize birds. Three Gold Bantams, 25*s.*; three Buff do., 25*s.*; two silk do., 15*s.*; two beautiful lop-eared Does, 10*s.* each, from prize stock. Fowls, Pigeons, and Rabbits sold and exchanged. Black Spanish Eggs and Birds for sale, beautifully white faced.—Apply to WM. WOODHOUSE, 15, Mansfield Street, Kingsland Road, London.

PURE BUFF COCHIN CHINA EGGS.

TO BE SOLD, a few EGGS of the above kind, at 10*s.* a sitting, carriage not included. More Eggs will be sent out as soon as a sitting of 13 is laid. All orders booked and executed in strict rotation.—Y. S. T., Post Office, Thirsk.

TO BE SOLD, BUFF COCHIN CHINA EGGS, from Birds that have taken prizes at the Derby, East Kent, Bristol, Taunton, and Yeovil Poultry Shows, at 1*l.* 1*s.* per dozen; also Partridge Cochin China Eggs, from Birds that have taken prizes at London Summer Meeting, Surrey Gardens' Show in August, Malvern, Yeovil, Honiton, and Torquay Poultry Shows, at 1*l.* 1*s.* per dozen. Apply to JOHN R. RODBARD, Aldwick Court, Wrington, near Bristol.

LIGHT BUFF COCHIN CHINA FOWLS' EGGS.—An Amateur having a first-rate stock of Light Buff Cochin China Fowls from Prize Birds, and more eggs than he requires for his own use, is willing to part with a few sittings at a reasonable price—5*s.* 6*d.* per doz., box included.—Address "Chanticleer," Post-office, Farnham, Surrey.

BRAHMA POOTRA FOWLS.

TO BE SOLD, a few Sittings of EGGS of this breed (according to priority of application), from the prize and selected birds of a gentleman—Brahmas of whose breeding have, during the past year, taken prizes at the following important Poultry Shows: the Royal Agricultural, Great Metropolitan, Birmingham, Great Yarmouth, Doncaster, Winchester, Norwich, and Manchester.—W. C. G., Post-office, Sandbach, Cheshire.

POLAND FOWLS.—The extra stock of a Gentleman, whose birds took first prizes at the Birmingham, Baker Street, Surrey, and other Shows in the past year. White, Golden, and Silver Cockerels, 1*l.* 1*s*; Pullets, 2*l.* 2*s.*; Eggs, 2*l.* per dozen. Yellow Polands, 4*l.* each; Eggs, 3*l.* 3*s.* per doz. White Spanish, 2*l.* 2*s.* per pair; Eggs, 18*s.* per doz. Black Spanish, 30*s.* per pair. Pure Buff Cochins, 15*s.* each. Jacobin Pigeons, 10*s.* per pair. Apply by letter to G. V., Mr. Ridgway's, 169, Piccadilly.

COCHIN CHINA FOWLS.

MR. EASON, whose Birds have taken first Prizes at the Metropolitan, Reigate, Hitchin, Yarmouth, Bury St. Edmunds, and other Poultry Exhibitions, has a few pairs to dispose of from 21*s.* to 30*s.* per pair; also a few choice COCKERELS, weighing from 8 to 11 lbs., well feathered, short in the leg, and of a beautiful buff colour, from 1 to 2 guineas each; PULLETS, of the same class, 21*s.* each; EGGS, 12*s.* per dozen; from prize Birds, 21*s.*, including packing. The Birds may be seen any morning, except Sunday, before 11 A.M., at Montpellier House, South Lambeth, London.

MR. GILBERT, of Grays, Essex, having entered into an arrangement with THOMAS STURGEON, Esq., for the Purchase of the whole of his remaining Stock of COCHIN CHINA Fowls, bred by him in 1853, Gentlemen and Amateurs are informed the Birds are now on Sale. Eggs may be had from the above birds at 20*s.* per dozen.

Sales by Auction.

Also a variety of Curbing, Closet Pans, &c. Likewise the Lease, Goodwill, and Implements in Trade of the old established business which has been successfully carried on there for the last 15 years.

May be viewed prior to the Sale, and further information, with Catalogues, had on the Premises, and at Mr. PEAKE'S Offices, 44, Tooley Street, and 4, Fair Street, Southwark.

HUNTINGDON.

To NOBLEMEN, GENTLEMEN, NURSERYMEN, AND OTHERS.
IMPORTANT SALE OF NURSERY STOCK.

G. M. FOX will Sell by Auction on TUESDAY, March 14, and following days, 10,000 FRUIT TREES (now growing in the George Lane Nursery, Huntingdon, being one of the Nursery Grounds occupied by Messrs. Wood & Ingram, which is obliged to be cleared immediately, the land being required for building purposes), consisting of choice sorts of Apples, Pears, Plums, Cherries, Peaches, Nectarines, and Apricots; 8000 choice GOOSEBERRIES and CURRANTS, 7000 English and Huntingdon ELMS, 2000 ROSES, and a large quantity of Forest and Ornamental Trees, Evergreens, and Flowering Shrubs. The Nursery Ground is within five minutes' walk of the Great Northern and Eastern Counties Railway Stations.—Catalogues, with full particulars, will be ready 10 days before the Sale, and may be had of Messrs. HURST & M'MULLEN, 6, Leadenhall Street; the Office of the Journal of Auctions, 29, Essex Street, Strand, London; the principal Inns in the neighbourhood, and of the Auctioneer, Huntingdon; or will be forwarded on the receipt of four postage stamps.

Messrs. Wood & Ingram's business will be conducted as usual, at their other Nursery Grounds in Huntingdon.

PAGE AND CO.'S

COMPOSITION FOR THE DESTRUCTION OF BLIGHT

UPON

Roses, Wall-fruit Trees, Cucumbers, Melons, Vines, and Stove and Greenhouse Plants.

Extra Strong, 4s. per gallon, sufficient to make four (Jars and Barrels extra).
In Bottles, 1s. 3d. and 2s. 6d. each. Directions for application forwarded.
10 Gallons and Upwards CARRIAGE FREE TO LONDON.

THE superiority of B. PAGE AND CO.'S BLIGHT COMPOSITION being established beyond question, it is scarcely necessary to mention that great improvements have been made in its manufacture during the last season, both in point of strength and clearness, and that it not only possesses the power of destroying every pest to which plant and fruit-growers are alike subject (without injuring the most delicate flowers or foliage), but promotes a vigorous growth. The accompanying testimonials are proof positive:—

From Andrew Toward, Esq., Royal Gardens, Osborne Place.

Dear Sir,—In reply to your letter of the 2d inst., I have great pleasure to add my testimony to the efficacy of your Composition for the destruction of Blight, which has been used here with great success on Rose trees much affected with Green-fly.—Nov. 5, 1852.

From W. Stride, Esq., Redbridge.

Knowing as you do my attachment to my garden, and the interest I feel in everything connected with both fruit and flowers, I am a little astonished at your never having sought my opinion of your new Composition for the destruction of the Aphis, and of the Tree Blight generally; especially when I sent to your store for a second supply. I am sure you will be pleased when I tell you I have found it completely effective, when mixed with an equal part of water, in destroying at a single application every kind of enemy which attacks the Peach, the Fly on the Rose, and better than all, so far as I am individually concerned, a black Fly or small shiny Beetle which appears on the tender shoots of young Cherries about Midsummer, and which on Espaliers I never could annihilate till last summer, when one application effectually removed the whole community and enabled the trees to make satisfactory progress to the end of the season. I feel assured it will prove a substitute for the expensive mixture with which gardeners generally dress the Peach-walls after spring pruning, but my communication on this point you must wait for till next year.—Nov. 5, 1852.

From the Rev. E. T. Richard, Farlington Rectory.

As the season is now drawing to a close, I can assert that the Blight Composition I had from you in the summer has been of the greatest benefit to my trees; it seems to have perfectly stopped the spread of a parasitic fungus which had infested a large Vine for six or seven years; the infested leaves, although marked by the fungus, have become perfectly healthy; in short, the Vine presents a very different appearance from that of last year at this season. I have some Plum trees which were greatly infested with Aphides, but the Composition has restored their luxuriance.—Oct. 11, 1852.

From J. Staples, Esq., Belmont House, Salisbury.

I have tried your Composition, and am very much pleased with the result, my fruit trees having quite recovered the excessive blight that affected them early in the season.—August 11, 1852.

From Mr. A. Dowling, Hollyhill, Gardener to the Right Honourable Lord Henry Cholmondeley, M.P.

Your Composition is most destructive to all Blight. My wall trees must have died had I not availed myself of it. I consider it applicable to all cases, as it is not the least injurious to the foliage of the most tender plants.—May 17, 1851.

From Mr. J. Dummer, Gardener to the Very Rev. The Dean of Winchester, Bishopstoke.

I have used your Composition upon Cucumbers, Melons, Roses, Pot Plants, and Wall Trees, with perfect success in every instance, and consider it the most safe, speedy, and effectual remedy ever introduced.—Oct. 22, 1852.

From Mr. Wilkins, Gardener to H. F. K. Holloway, Esq., Marchwood Lodge.

I highly approve of your Composition, as it answers admirably, saving my wall trees from an untimely death, and quite recovering my Roses, killing every insect it touches in an instant. I intend to have a quantity of it this season for all my plants.—May 20, 1851.

From Mr. W. Farthing, Gardener to the Right Honourable Lord Ashburton, The Grange Park.

I consider your Composition valuable for the destruction of Insects of all kinds.—Nov. 3, 1852.

From Mr. J. Allen, Gardener to the Right Hon. Sir Francis Thornhill Baring, Bart., Stratton Park.

No doubt you will recollect I had your Blight Composition late last spring. My Peaches and Nectarines were then sadly infected with blight, but after syringing them according to your directions, it quite disappeared, nor have they had a blighty leaf upon them since. I tried it on two large Orange trees which had the Green-fly very bad, and it destroyed it immediately, nor has it been seen on them since, and the trees are now in a healthy flourishing state. I shall continue to be a customer, as I believe it to be a never-failing remedy.—Oct. 12, 1852.

From Mr J. Thorn, Gardener to Sir Charles Taylor, Bart., Hollybrook.

I am satisfied of the efficacy of your Blight Composition.—Aug. 11, 1852.

From Mr. D. Forbes, Gardener to G. E. Eyres, Esq., Warrens.

I am happy to bear testimony to the great utility of your Blight Composition in the destruction of Brown Scale and Red Spider, in the hothouses and upon the open wall.—Oct. 6, 1852.

From Mr. W. Wilson, Nurseryman, Wimborne.

The gentlemen for whom I procured the Blight Composition have told me that it effectually killed the blight.—Aug. 9, 1852.

From Mr. F. Haslar, Gr. to the Rev. W. Fitzhugh, Bannister Lodge.

I beg to recommend your Composition for killing Insects and Blight on Wall Trees; I have used it on the Peach and Nectarine, and found it of great service, as my trees had the blight last spring, but recovered and made some excellent wood.—Nov. 2, 1852.

From Mr. W. Robbins, Gardener to W. Beach, Esq., Oakley Hall.

I have used your Composition with one-third water, and it killed Green-fly, and without water it destroyed Thrip.—Nov. 4. 1852.

From Mr. J. Menzies, Gardener to J. Groves, Esq., Ferne Park.

I highly approve of your Composition, which is most destructive to all sorts of Aphis. With one application I perfectly cleared my Cherry trees, and intend in future to avail myself of it.—Oct. 12, 1852.

From Mr. A. Hibbard, Gardener to T. Hill, Esq., Fir-grove.

Your Composition has completely killed the "Mealy Bug," which was very strong upon some imported Orchids, &c., without the least injuring flowers or leaves.—Feb. 10, 1853.

From Mr. Smith, Gardener to the late Mrs. Preston Hulton, Barnfield.

Your Composition has been tried by me, and I am glad it has proved so good for killing all insects, and making the trees healthy for bearing, which is a great point; it is excellent as well for Cucumbers.—Nov. 5, 1852.

From Mr. A. Mennuir, Gr. to Spencer Smith, Esq., Brooklands.

I have given your Blight Composition a trial, having had it applied to the Fruit Trees here (which were very much blighted), and I am happy to say with very good success, for although some of the trees are very old, they are very much improved by its application.—Nov. 8, 1852.

From Mr. J. E. Froud, Gardener to General Blunt, Barnfield.

After the first application of your valuable Composition to my Peach and Nectarine Trees, I found every insect dead, and in a week the trees were healthy and growing vigorously. I also tried it upon Pelargoniums and Cactus in blossom, covered with Green-fly, which were all killed instantly, and the blossoms remained as fresh as ever.—Oct. 19, 1852.

From Mr. Pullinger, Gardener to Mrs. Watson, Brookfield Lodge.

I have given your Composition a fair trial upon Roses, Fruit Trees, and Greenhouse Plants, and am much pleased with the results: my Fruit Trees are perfect pictures.—Oct. 21, 1852.

From Mr. W. Hocking, Gardener to J. J. Briscoe, Esq., Fox Hills.

I have great pleasure in bearing testimony to the efficacy of your Blight Composition; it has killed the blight in every instance, and the Wall Trees quickly regained a fine healthy foliage. For Roses and Greenhouse Plants it is equally efficacious, killing the blight without injuring the foliage.—Oct. 18, 1852.

From Mr. J. Bowen, Gr. to C. C. Codrington, Esq., Dean House.

My Wall-fruit Trees were dying from excessive Blight, but after two syringings with your Composition they quite recovered, and made some excellent wood. For my Roses also it did the same, or I should not have had a blossom open; it is both a cheap and an effectual remedy, which no gardener should be without, and it is equally adapted for pot plants.—Oct. 22, 1852.

From Mr. J. Ratty, Gardener to G. L. Baker, Hartley Grange.

I have used your Blight Composition on Wall Trees, and find it an invaluable specific against Blight.—Nov. 14, 1852.

From Mr. G. Lush, Gardener to W. Betts, Esq., Bevois Mount.

My Peach Trees were attacked with Brown Scale, after the fruit was gathered, for which I applied your Composition, which perfectly destroyed it; I also tried it on some Stove Plants with the same effect.—Nov. 25, 1852.

From Mr. Thomas Bundey, Gardener to the Rev. F. Beadon, North Stoneham.

Your Composition is most destructive to all the insect tribe. With me it has proved itself very valuable, instantly removing all insects without the least injury to the plants.—Dec. 2, 1852.

From Major Munday, Hollybank.

Major Munday encloses Messrs. PAGE & Co. postage stamps in payment of a jar of Composition, which he has found highly efficacious.—May 26, 1853.

From Mr. E. Minnett, Gardener to General Gilbert, Tweed.

Your Composition has proved very effective upon Cucumbers, Melons, and Peaches. I consider its merits will bring it into general use.—Aug. 17, 1853.

From Mr. J. Taylor, late Gardener to Chas. Tucynam, Esq., Portswood.

I am glad to bear testimony to the great utility of your Blight Composition for the destruction of Mealy Bug, Brown Scale, and Red Spider.—Aug. 19, 1853.

From Mr. Chas. Gosling, Gr. to W. Iremonger, Esq., Wherwell Priory.

I have found your Composition have great effect upon Red Spider, Green-fly, &c.: it also produces a luxuriant growth. For eight years I have suffered from blight, which could not be got rid of until this season, when one application of the Composition entirely destroyed it. For the future I hope to use it in all cases.—Aug. 21, 1853.

From Mr. H. Cull, Gardener to the Rev. H. Brine, Boldre.

I have this season made use of your Blight Composition, and found it effective in extirpating Green-fly from Cucumber Vines, without injury to the plants.—Sept. 13, 1853.

From Mr. G. Mitchell, Gardener to W. W. Whitmore, Esq., Dudmaston Hall.

I am very happy to inform you that your Composition has turned out quite satisfactory. I tried it on the Peach trees in the houses, and wherever it touched, every leaf became clean and healthy. You will please send me two gallons in the spring.—Sept. 17, 1853.

From Mr. F. Moore, Gardener to the Right Hon. Earl Grey, Howick Hall.

After giving your Blight Composition a fair and impartial trial, I am glad to bear testimony to its efficacy in destroying those worst of all pests, the Thrip and Red Spider, two parts water to one composition; but the Green-fly quickly disappears if double that quantity of water be used. I have not found it to injure the most delicate plants.—Sept. 17, 1853.

From Mr. W. White, Gr. to W. Hans Sloane Stanley, Esq., Paultons.

I consider your Composition valuable for the destruction of insects of all kinds.—Sept. 20, 1853.

From Mr. E. Spivey, Gr. to W. Hobloun, Esq., Hallingbury Gardens.

I was much pleased with your Blight Composition; I applied it to my Cucumbers for the Thrip, and glad I am to say that it drove them completely out of the house, and the plants did well afterwards.—Sept. 24, 1853.

From Mr. G. Gaiger, Gardener to J. Corrie, Esq., Southington House.

The Blight Composition effectually destroyed the Bug. Should my Vines be again attacked, I should use your Composition above anything.—Sept. 27, 1853.

From Mr. James Moore, Gardener to Miss Garnier, Wickham.

I found your Composition answer perfectly well for the destruction of Green-fly upon Roses, &c.; better than the strongest tobacco-water, and much more economical. I shall thank you to send me another supply in the spring.—Oct. 8, 1853.

From Mr. B. Smith, Gr. to R. Gosling, Esq., Borbys Park, Chertsey.

I have given your Composition a fair trial, and am perfectly satisfied of its efficacy.—Oct. 12, 1853.

From Mr. Lucas, Gr. to the Right Hon. Lord Palmerston, Broadlands.

I have used your Composition according to your directions, and consider it valuable for the destruction of Insects, &c. I am confident it will be much used when gardeners give it a trial.—Jan. 5, 1854.

From Mr. Atkins, Gardener to John Jenkyns, Esq., Borley Hill.

I used your Composition on young Peach and Nectarine trees, and found it of great service.—Jan. 5, 1854.

From Mr. A. Barnes, late Gardener to the Rev. Mr. Rasleigh, Hamber Rectory.

I highly approve of your Composition for destroying Mealy Bug and Thrip on stove and greenhouse plants; for the bug I applied it three times before it was totally killed.—Jan. 1, 1854.

From Mr. G. Jones, late Gardener to Charles Seagrim, Esq., Southgate House.

Having used your Composition on Peach, Cherry, and Rose Trees, Greenhouse Plants, Cucumbers and Melons, it speedily effected the desired purpose, without the least injury to the plants; it is the cheapest and best remedy ever offered to the public.—Jan. 11. 1854.

From Mr. S. Wraight, Gardener to J. Lake, Esq., Green Street, Sittingbourne.

It is with pleasure that I state your Composition has proved valuable to me, in the destruction of Green-fly, Red Spider, &c., during the past season.—Jan. 12, 1854.

From Mr. Harris, Gr. to the Rev. E. Timson, Tatchbury Mount.

I have used your Composition must successfully upon Peach and Nectarine trees, and have seen it succeed equally well with my friends, and consider it is the remedy we must all have recourse to.—Jan. 18, 1854.

From Mr. Smithers, Gardener to Sir W. Milner, Bart., New Appleton, Tadcaster.

Your Blight Composition answered perfectly well.—Jan. 23, 1854.

From Mr. J. Daniels, Gardener to the Rev. C. E. Rucks Kerne, Sivycombe House.

The Blight Composition I found most efficacious in the destruction of all kinds of insects, more particularly that troublesome pest the Cucumber Thrip, which has hitherto resisted every means that have ever been recommended for its destruction. I find on being touched by the Composition it instantly dies, and I found it much more destructive to all the Aphis family than tobacco water, without doing the least injury to the most tender plants.—Jan. 24, 1854.

From Mr. Jno. Page, Gardener to A. Dixon, Esq., Birches Green.

I used your Composition upon Vines infested with mildew, which it instantly arrested; also on Cherries and Peaches, for the Aphis and Spider, with beneficial results; it also produces a fine, dark, healthy foliage wherever it is applied.—Jan. 31, 1854.

From Mr. Jones, Gardener to J. M. Elwes, Esq., Bossington House.

My Vines were very much infested with Scale and Red Spider, berries as well as leaves, and seeing the many testimonials by experienced men of the good effects produced by your Composition, I gave them two syringes all over, which effectually destroyed both pests. I think it the best remedy for Green-fly, &c., that can be produced.—Feb. 28, 1854.

GENERAL PRICED CATALOGUE OF SEEDS to be had upon application.

Fine Long Red Mangold Wurzel	per lb.	1s.	0d.

21, REGENT STREET.

HORTICULTURAL SOCIETY OF LONDON.
PRIVILEGED TICKETS.

The Exhibitions will take place on the Second Saturdays in May, une, and July, namely—

MAY 13, JUNE 10, JULY 8.

All Fellows who shall apply, on or before Tuesday the 25th of April, may obtain, at the rate of Three Shillings and Sixpence each, any number of Tickets NOT EXCREDING THIRTY-SIX; but no application for such tickets will be received after that day. *Fellows of the Society subscribing for tickets at this price will be allowed a clear week from the 25th of April during which they may claim them.* AFTER THAT PERIOD ALL THE 3*s*. 6*d*. TICKETS SUBSCRIBED FOR, BUT NOT ISSUED, MAY BE CANCELLED.

After the 25th of April, any further number of tickets will be delivered to Fellows on their personal application or written order, at the price of *Five Shillings* each ticket.

SPECIAL PRIVILEGE OF FELLOWS.—Fellows of the Society enter free at half-past 12, and can introduce TWO friends WITH TICKETS; or the Fellow's privilege may be transferred to a brother, sister, son, daughter, father, mother, or wife, residing in the Fellow's house, provided the person to whom the transfer is made be also furnished with a ticket signed by that Fellow. That is to say, the privilege of entering early may be transferred, but not the privilege of FREE admission.

ROYAL SURREY ZOOLOGICAL GARDENS.—FLOWER SHOWS, open to all England, will take place in June, July, and September.

Arrangements are also making for a GRAND EXHIBITION OF HOLLYHOCKS in August.—No Entrance Fees.

ISLEWORTH HORTICULTURAL SOCIETY.—The next Exhibition will take place on the 8th day of August next, instead of the 7th of September, as previously advertised, in the Grounds of Gordon House, on the Banks of the Thames, by kind permission of Hamilton Cooke, Esq., when Prizes, open to all England, will be awarded for Flowers, Fruit, and Vegetables.—Further particulars, with Rules and Regulations, may be obtained on application to HICKSON BRIGGS, Hon. Sec.

Holland House, Isleworth, 18th March.

CAMELLIAS.

CHANDLER AND SONS beg to inform the Nobility and Gentry that their CAMELLIAS are now in flower. Also, a variety of Plants for the Conservatory and Drawing-room. Wardsworth Road, Surrey.

LILIUM LANCIFOLIUM, PELARGONIUMS, RANUNCULUSES, ANEMONES, AND GLADIOLUS.

HENRY GROOM, Clapham Rise, near London, by Appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to say that his SPRING CATALOGUE is ready, and will be forwarded by post on application.

MANETTI ROSE STOCKS.

THOMAS CRIPPS respectfully informs the Trade he has a few thousands of the above to dispose of, at 60*s*. per 1000, or 7*s*. per 100. A remittance, or reference to a London house, accompanying an order, will meet with prompt attention. Tunbridge Wells Nursery.

"WELLINGTONIA GIGANTEA."

MESSRS. VEITCH, of EXETER and CHELSEA, have much pleasure in stating that their Seeds of the above magnificent Tree are vegetating satisfactorily. They therefore hope to be able to send out well established seedling plants during the ensuing summer and autumn. They are now taking orders for them at the following prices:—

For a Single Plant	2 guineas	For 8 Plants	10 guineas
For 4 Plants	6 guineas	For 12 Plants	12 guineas

And all orders will be executed strictly in the rotation in which they are received.—March 18

WELLINGTONIA GIGANTEA.—Beautiful Lithographed Plates (from a drawing taken in California) of this wonderful Tree may be had, at 7*s*. 6*d*. each, of Messrs. VEITCH & SON, Exeter, and Mr. JAMES VEITCH, jun., Exotic Nursery, Chelsea.

The Bark, Wood, Cones and Foliage, which were exhibited on Tuesday week at 21, Regent Street, may be seen at the Exotic Nursery, Chelsea.—March 18.

TO FLORISTS.

THE SUBSCRIBER begs to intimate that he will send out early in April the under-noted FLOWERS, which he is confident will be useful additions to any collection.

PANSY.—TELEGRAPH STUART'S).—A fine dark plum-coloured self, of great substance—was a conspicuous flower in stands which gained 10 First Prizes last season. Price 5*s*. each.

VERBENA.—LEUCOSTEIMA (MEIN'S).—Pure white, very large compact truss—Certificate of Merit from Caledonian Hort. Soc. in 1853. Price 5*s*. each.

Edgehill Nursery, Dea, Edinburgh, March 18.

PERMANENT PASTURE.

R. H. SMITHE, of Eastling, Faversham, Kent, is now prepared to send out his Mixtures of the NATURAL GRASSES, PERENNIAL CLOVERS, &c., to lay down Land to Permanent Pasture, at 25*s*. per acre, allowing 3 bushels to the acre, carriage free. Mixtures for Lawn, or any other purpose, or the sorts separate. Most of the species of Grass are collected by the Advertiser, and he will bestow the greatest attention in selecting such as shall constitute mixtures specifical to the soil, purpose, &c., of each buyer.

TO THE SEED TRADE AND OTHERS.—

Champion of England Pea	Green-top Scotch Turnip
Early Emperor	Red Tankard
Scimitar	White Globe

Any or all the above forwarded free by post.

In May the following 12 new Verbenas, raised by Messrs. Banks, Stewart, and Fozard, will be ready for sending out at 42*s*. the set, viz., Orion, Robin Hood, Marie Antoinette, Matchless, Beauty, Madonna, Attraction, Diadem, Ne Plus Ultra, Ariosto, Beauty of the Garden, and Sulphur Model. For the descriptions see this Paper of the 11th of March.

Seed Catalogue forwarded post free, containing a description of the best known new Annuals, excluding the new Californian and other varieties that have not sufficient merits for our recommendation.—March 18.

CELERY SEED.—A small quantity of SEYMOUR'S SUPERB WHITE, pronounced by the Editor of the *Gardeners' Chronicle* to be "what it should be," can be had in Half-ounce Packets, by enclosing four postage stamps to Mr. LUFF, Wiston, Steyning, Sussex.

NEW ALSIKE CLOVER, Price Ten Guineas per cwt., or in small quantities at 2*s*. per lb., may be had on application to Mr. H. RAYNBIRD, Basingstoke, Hants. Also New Home-grown ITALIAN RYE-GRASS, of good and genuine Stock, at 30*s*. to 35*s*. per quarter.

SUPERIOR LARGE BROAD-LEAVED SCOTCH VETCHES (or TARES), at 42*s*. 6*d*. per sack of 4 bushels, sack included, and carriage paid to London, Liverpool, and Hull. The supply is limited.

TRUE ALSIKE CLOVER, 2*s*. per lb.

*** Unknown correspondents will please send a remittance with their order.

W. DRUMMOND and SONS, Seedsmen, Stirling, N. B.

This Advertisement will not be repeated.

WANTED, Fifty Strong Plants of the ROUGH-LEAVED BEARSFOOT (ACANTHUS SPINOSUS).—Address, with particulars of price, to D. M., 11, Hanover Square.

TO SEEDSMEN AND GARDENERS.

TO BE SOLD, 50 lbs. of good CAULIFLOWER SEED, saved in 1853, at 7*s*. per lb.; also some ASPARAGUS PLANTS, at 5*s*. per rod.—Apply to JAMES BROWN, Gardener, Deptford, Kent.

SILVER FIRS FOR SALE.

JOSIAH HILL begs to inform Noblemen and Planters generally that he has a large assortment, from 1½ to 3 feet (twice transplanted); very healthy and well rooted.

Briston Nursery, Norfolk.

IMPORTANT TO SEEDSMEN AND OTHERS.

EARLY SEED POTATOES.—Thirty-six Sacks EARLY ASH-LEAF KIDNEY POTATOES, 10*s*. per bushel. Ten Sacks JACKSON'S IMPROVED ditto, 12*s*. per bushel. A sample bushel will be sent to any part of the country on the receipt of an order for the amount.—An early application is requested to THOMAS WILD, Horticultural Agent, Ipswich.

PINK KIDNEY POTATOES.—These Potatoes possess a most delicate flavour, and when cooked they rival finest flour in whiteness and appearance; they are celebrated for their lasting properties, and if kept dry are quite as good in the month of May for domestic purposes as when first taken up. They are a healthy, hardy, and extraordinary prolific stock. The advertiser can with confidence recommend them, as he has seen them tested for the last three seasons. The sample now offered (about 50 sacks) is entirely free from disease and a good size. Growers about to change their seed will find it answer their purpose to give them a trial. They will be sent out in not less quantities than 2 bushels, price 14*s*., including bag; and no communications unless accompanied with a remittance, will be attended to.—Apply to JOSEPH WILSON, St. Helen's Street, Ipswich, Suffolk.

GRASS SEEDS FOR PERMANENT PASTURE.

WHEELER AND SON'S DESCRIPTIVE LIST of GRASS SEEDS will be forwarded free on application.
J. C. WHEELER AND SON, GLOUCESTER.

A FIRST CLASS CATALOGUE OF GERANIUMS, VERBENAS, FUCHSIAS, DAHLIAS, HOLLYHOCKS, ETC.

GEO. SMITH begs to announce that the above is now ready and will be forwarded in exchange for one postage stamp.—Tollington Nursery, Hornsey Road, Islington.

ROBERT M. STARK begs to intimate that his Spring Catalogue of FLORISTS' FLOWERS, BEDDING PLANTS, &c., for the season, is now ready and may be had on application.

Very superior assortment of Imported GERMAN FLOWER-SEEDS, NEW ANNUALS, &c., of which separate Lists may be had.—Edinburgh: Edgehill Nursery, and 145, Princes Street.

CHARLES ALEXANDER (late of DICKSONS & Co.), SEEDSMAN and FLORIST, 32, West Register Street, Edinburgh. His Descriptive Catalogue of Select Garden and Flower Seeds is just published, and will be forwarded free on application.

A DESCRIPTIVE LIST of DAHLIAS will be forwarded by T. LOCKHART, FLORIST, Fulham, near London, on receipt of one postage stamp.

Finest CALCEOLARIA SEED, 2*s*. 6*d*. per packet; and LOCKHART'S celebrated ROSETTE COLLARD, for sowing in May, 3*s*. per ounce, free by post.

GEORGE BAKER begs to say that his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, CONIFERS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES, &c., may be had by enclosing two postage stamps.

G. B. wishes to call particular attention to his fine Stock of GREEN and WEEPING HOLLIES, from 1 to 12 feet high.

G. B. has supplied the American Exhibition in the Royal Botanic Gardens, Regent's Park, from its commencement.

American Nursery, Windlesham, near Bagshot, Surrey, about six miles from Staines Station, Windsor Branch, South-Western Railw. ; where conveyances may be obtained.

N. GAINES begs to announce his List of Dahlias and Pelargoniums for 1854 is now ready. It contains a description of his three Seedling Dahlias to be sent out in May, viz., Alba superba, Primrose Perfection, and King of the Yellows. Also a Printed List of Fuchsias, Cinerarias, Chrysanthemums, Auriculas, Cornwas, Verbenas, Camellias, Azaleas, Rhododendrons, &c., &c., may be had post free on application.

Nursery, Surrey Lane, Battersea.

PINUS SABINIANA,
THE GREAT HOOKED CONE PINE OF CALIFORNIA.

PETER LAWSON AND SON, Edinburgh, have just received from San Francisco a small consignment of Seeds of this fine Hardy Pine. Price 2*s*. 2*s*. for 100 selected Seeds, free by post. They were gathered last autumn, and are in excellent condition and well grown—the seeds measuring about 1 inch in length. Being perfectly hardy, they may be sown in a dry sheltered situation in the open air.—Edinburgh, March 18.

DOUBLE FRENCH MARIGOLD AND CAPE STOCK SEEDS. A packet of beautiful DOUBLE FRENCH MARIGOLD SEEDS forwarded on receipt of Seven Penny Postage Stamps. Ditto, SCARLET CAPE STOCK, ditto. EDWARD SANG & SONS, Nursery and Seedsmen, Kirkaldy, N.B.

DOUBLE ITALIAN TUBEROSE ROOTS, 4*s*. per dozen.—The annual importation of the above-named beautiful and fragrant Flower has just been received, and large and well selected Bulbs may be obtained, without disappointment, at A. CORBETT'S Foreign Warehouse, 18, Pall Mall.

N.B. Printed regulations for treatment sent; also, just arrived very moist and open Parmasan Cheeses.

WILLIAM NICHOLSON still continues to send out very strong well-rooted Plants of his four new and distinct varieties of STRAWBERRIES, viz., AJAX, dessert Fruit; RUBY, ditto; CAPTAIN COOK, Market Fruit; FILL-BASKET, ditto, at 15*s*. per 100, or 25 each of any two sorts for 10*s*., box included. Post-office orders payable at Yarm, Yorkshire. For a full description, see Advertisement *Gardeners' Chronicle* Jan. 28, 1854.—Egglescliffe, near Yarm, Yorkshire.

THE FINEST BALSAMS IN EUROPE, in Six Classes; Seed saved by Mr. GLENNY from flowers three inches across: the six, 37 stamps; Mixed Seeds, 13 stamps, in Sealed Packets only, signed and sealed. The finest seeds that can be had procured to order, and all other choice Horticultural subjects.—420, Strand.

HOLLYHOCKS.

A. PAUL AND SON have now ready for Sale a very large and healthy stock of HOLLYHOCKS, suited to bloom well next autumn; Border Flowers, 4*s*., 6*s*., and 9*s*. per dozen; fine named kinds, 12*s*., 18*s*., 24*s*., and 30*s*. per dozen. A fresh supply of their new and unrivalled seedlings, which obtained first prizes at the leading exhibitions last year, and were never once beaten, will be sent out the end of the month, strong, healthy plants. A priced descriptive Catalogue free by post on application.

Recently published, free by post, price 1*s*., AN HOUR WITH THE HOLLYHOCK.

N.B. Post-office orders may be drawn on Waltham Cross or London.—Nurseries, Cheshunt, Herts.

MAY'S PARAGON CABBAGE.

THE Subscriber, in offering the above for the first time, guarantees it to be the finest Cabbage in existence; of dwarf habit; has never been known to run; attains a large size (having been grown to the great weight of 28 lbs.); of a most beautiful green, and boils tender as Asparagus, which it continues to do throughout the season; in flavour is as far superior to the ordinary Cabbages of the day as they are to the old Drumhead Scotch. In ½ oz. packets, 1*s*. each, free by post. The usual allowance to the trade.

H. M. begs to inform the public that he is unable to supply any more of his MAGNUM BONUM LETTUCE, as the stock was only small and is completely sold out.

Address all orders and communications to HENRY MAY the Hope Nurseries, near Bedale, Yorkshire.

CHOICE NEW GERANIUMS, ETC.

HENRY WALTON, Florist, &c., Edge End, Marsden, Burnley, Lancashire, begs to offer the following at the reduced prices annexed:—

GERANIUMS.—Optimum, Queen of May, National, Eleanor, Rachael, Heroine, Astrea, Leonora, Zaria, Lagoma, Cordelia, Kulla's Butterfly, Spot, Vulcan, Commander, Harriet, Jupiter, Purpurea, and Basilisk. Purchasers' selection of 12 of the above for 36s., or the set of 20 for 3l., Hamper, &c., included.

GERANIUMS.—Ambassador, Bride of Abydos, Chloe, Commissioner, Cristine, Enchantress, Exactum, Elise, Flying Dutchman, Ganymede, Jullien, Lablache, Lavinia, Lord Mayor, Lord Gough, Lancashire Witch, Pulchra, Painter Improved, Rosa, Renown, and Surprise. Purchasers' selection of the above, 20s. per dozen; H. W.'s selection, 17s. per dozen; or the set of 21 for 35s., with a plant of Henderson's Extravaganza included.

GERANIUMS, older show varieties, 9s. to 12s. per dozen.

Fancy varieties, 12s. to 24s. per dozen.

FUCHSIAS, new varieties of last Season.—Beauty, Brilliant, Collegian, Dr. Lindley, Duchess of Lancaster, England's Glory, Glory (Banks), Incomparable, King Charming, Lady Emily Cavendish, Lady Montague, Lady Franklin, Mrs. Patterson, Perfection, Princeps, Premier, Purple Perfection, Vesta, Beauty of Devonshire, and Roi des Fuchsias. The above 1s. 6d. each, or 10s. 6d. to 15s. per dozen.

CINERARIAS.—British Queen, Uttoxeter Pet, Dagobert, Lady of the Lake, Brilliant, Enchantress, Hebe, Tyrian Prince, and Prima Donna. The above 9 for 14s.

CINERARIAS.—Catherine Seaton, Clara Mowbray, Gustavus, Iago, Mrs. Sidney Herbert, Mr. Sidney Herbert Mrs. Charles Kean, Marianne, Magnum Bonum, Nonsuch, Rosy Morn, St. Clair of the Isles, and Surprise. 12s. per dozen, package included; older varieties, 6s. and 9s. per dozen.

VERBENAS, choice varieties of last year, 1s. each, or 7s. 6d. per dozen.

PETUNIAS, new varieties of last season, 1s. each.

The above selections are all strong, healthy, and well-established plants, and cannot fail to give satisfaction to parties purchasing.

PANSIES in great variety, of which H. W. possesses more than 2000 extra strong healthy plants of the best leading show varieties out, 4s. 6d., 6s., 9s., 12s., and 18s. per dozen.

H. W. has also a good collection of Hollyhocks, Dahlias, and a great variety of Bedding Plants, &c. &c., catalogues of which will be ready, and may be had for one postage stamp, in the course of a few days.

It is respectfully requested that all orders from unknown parties (unless reference is given) be accompanied with a Post-office Order, payable at Marsden, Lancashire.

CHRYSANTHEMUM "ANNIE HENDERSON."

This is a Plant in its class such as we have seldom had the good fortune to meet with. It exactly resembles the form and colour of the well known favourite "Annie Salter," which has never yet been surpassed, but of a much dwarfer habit. The present variety will be the forerunner of a new race in this increasing favourite autumn flower; but hitherto, from the lateness of their flowering season, the pleasure derived from it as a garden plant is but small compared to what it would be if the season for its flowering commenced earlier; this desideratum, however, we have obtained for the variety we have now the pleasure of introducing, as a plant that will become popular, from its bedding properties being so well adapted for that purpose, flowering, as it does, in the month of August with the German Aster in the open garden: and this will be the means of introducing a variety of colours among bedding plants not before obtained. No doubt, from the earliness of its flowering, seed will be easily obtained in this country, and a variety of colours will immediately follow, so that the Dahlia and Chrysanthemum Exhibitions may some day be blended.

Orders can now be taken for the above, which will be forwarded this Season when ready. Price 7s. 6d. each.

E. G. Henderson & Son, Wellington Nursery, St. John's Wood.

KNAP HILL NURSERY, WOKING, SURREY.

WATERER and GODFREY, Nephews and Successors to the late Hosea Waterer, respectfully invite the attention of parties engaged in planting to the following list:—

Araucaria imbricata, 2, 3, 4, 5, and 6 feet high, in the open quarters, regularly removed every year, and as robust and handsome as it is possible to get them. We have a large stock.

Cryptomeria japonica, 2, 3, 4, 5, 6 to 8 feet.

Cedrus Deodara, stout handsome plants from seed, in any quantity, and of all heights from 1 to 7 feet. A few splendid specimens 10 to 15 feet; warranted to transplant with perfect safety.

Cedar of Lebanon, 2, 3, 4, 5, 6, 7 to 10 feet. These large Cedars of Lebanon are also very handsome trees.

Cupressus macrocarpa, or Lambertiana, 2, 3, 4, 5, 6, and 8 feet, all from seed.

" Goveniana, 2 to 3 and 4 feet.

" Funebris, 2 and 3 feet.

" thyoides variegata, 2, 3, and 4 feet.

The Variegated White Cedar, a scarce but most beautiful variegated plant, seldom seen except at Elvaston Castle. We hold a large quantity.

Juniperus Bedfordiana, fine plants, 3, 4, and 5 feet.

" Chinese, 2, 3, 4, 5, 6, 8, and 10 feet.

" repandus, 3, 4, 5, to 8 feet.

" Upright Irish, 3, 4, 5, 6, 7, and 8 feet; perfect columns, and, except at Elvaston, unequalled.

" Virginiana, the Red Cedar, 4, 5, 6, and 8 feet.

Taxodium sempervirens, 2, 3, 4, 5, and 7 feet.

Yew, common, 3, 4, 5, to 8 feet high.

" Irish, 3, 4, 5, to 10 feet. A splendid lot, all being trimmed to one stem; it adds much to their appearance and value.

" Gold striped, 1, 2, and 3 feet.

" do. worked on the Common, with fine heads, 4, 5, 6, and 7 feet high; very handsome.

" elegantissima (new striped) standards. The golden Yews are very ornamental, and we have a large quantity of fine plants.

" Dovaston, or Weeping Yew, fine standards.

Pinus Douglasi, 3, 4, 5 and 7 feet; a few magnificent plants, 10 to 12 feet high.

" insignis, 2, 3, 4, 5, 6, and 7 feet; all from seed.

" cembra, 3, 4, to 6 feet.

" Canadensis (Hemlock Spruce), 3, 4, and 6 feet.

" morinda, 3, 4, and 6 feet.

" Menziesi, 3, 4, 6, and 8 feet.

" cephalonica, 3 to 4 feet.

" Pinsapo, large and handsome, 3 and 4 feet.

" Nordmaniana, from seed, 1½ foot; a few larger, 2 feet.

" nobilis, stout plants, with perfect heads, about 1½ foot; a few larger specimens, 3 and 4 feet. We hold a fine stock of this beautiful Fir, none of which are grafted.

Thuja Arbor-vitæ, American, 3 to 6 feet. We recommend this plant for hedges.

" Wareana, 3 to 6 feet, one of the few really hardy and most useful evergreens.

" aurea. This is perhaps one of the prettiest plants of the day; it was first sent out from this Nursery, and our stock, for size and beauty, is unsurpassed.

Libocedrus chilensis, 1½, 2, and 3 feet. This is a very distinct and beautiful plant, of recent introduction. Our stock is large and good.

Independent of the foregoing we are very large holders of the most useful Evergreens, Deciduous and Ornamental Trees, and of large size. Priced Catalogues will be forwarded on application, enclosing two postage stamps, which will also include a Descriptive Priced Catalogue of the celebrated collection of American Plants grown at this Nursery.

The Nursery is near the Woking Station, and about an hour's ride from London. A visit is earnestly solicited from all who intend planting during the forthcoming season.

WHITE MULBERRY TREES,

Expressly Cultivated for the Rearing of the Silkworm.

GEORGE BALCHIN is now sending out fine healthy White Mulberry Trees at the following low prices: 10s., 15s., 20s. and 25s. per 100. Also Silkworms' Eggs, of a superior quality, white and yellow, 1s. 6d. per 1000.

Orders containing Post Office order punctually attended to.

Address, John Richard Evans, Cork Street, Bond Street London; or, George Balchin, Spring Place, Godalming, Surrey.

HIMALAYA CEDAR.

MAULE and SONS beg to intimate to Noblemen and Gentlemen engaged in Forest or Ornamental Planting that they still hold large supplies of this universally admired and fine timber tree, which they are sending out at the below quotations.

CEDRUS DEODARA, 2 years, fine,		25s. per 100,	10l. per 1000
" "	1 foot ...	5l.	"
" "	1 to 2 feet ...	7l. 10s.	"
" "	2 to 3 feet ...	42s. per doz.,	15l. per 100
" "	3½ to 4 feet...	60s. "	25l. "
" "	4 to 4½ ft., extra } fine, for Avenues and single planting }	80s. "	30l. "

☞ Those marked ○ are grown in suitable sized pots; those marked ○○ may be had either in pots or from the open ground.

Large supplies of Taxodiums, Cryptomerias, Pinus excelsa, Abies Smithiana, Cupressus Goveniana, Lambertiana, &c. &c., offered at such prices as will admit of their introduction into mixed forest and other plantations. Terms sent on application.

The Nurseries, Bristol, March 18.

BASS and BROWN'S SEED AND PLANT LIST

free by post for three penny stamps.

COLLECTIONS OF VEGETABLE SEEDS.

The following comprise the best in cultivation, including several new sorts of first-rate quality:—

No. 1, Collection for a large garden, for one year's supply	£3	0	0

Bass & Brown, Seed and Horticultural Establishment, Sudbury, Suffolk. Established about Half a Century.

FUCHSIA "TRENTHAM."

COLE and SHARP, Aston Lane Nursery, near Birmingham, have the satisfaction to announce that they are preparing to send out the above noble seedling Fuchsia, which they feel confident, from its colour, habit, and fine character, will be generally regarded as a desideratum, both in the Conservatory and for Exhibition purposes. The following critical remarks upon its merits will show the high estimation in which it is held by competent judges.

"Your Fuchsia is a bold and distinct variety, with remarkably broad scarlet sepals, and a fine purple corolla, of good substance and brilliant colour. It may not reflex sufficiently for some parties, but its bold properties will doubtless render it a great favourite."—*Mr. Charles Turner, Royal Nursery, Slough.*

"Your bloom has good broad sepals, and is a stout and well reflexed flower; the foliage is fine. It will prove an addition to its class, or we are mistaken."—*The Midland Florist, October* 1853.

The Censors of the Birmingham and Midland Society for the Promotion of Floriculture, who awarded this Fuchsia a first-class certificate:—"The blooms are unusually large, well proportioned, and of good substance, the sepals being of a brilliant scarlet colour, very broad, and gracefully reflexed. The corolla is of a purplish mazarine blue, smooth, and velvety. The foliage is fleshy, large, and handsome."

Plants 10s. 6d., with the usual allowance to the trade. Coloured engravings (mounted) forwarded on receipt of address, accompanied by six postage stamps.

WM. HAMILTON, Seedsman & Florist, &c., 41, Margaret Street, Cavendish Square, London, offers the following NEW SEEDS, free by post, for 5s.:—

Arctotis breviscapa	Ipomœa luteum
Centranthus macrosiphon	Linum grandifl. var. rubrum
Ethulya corymbosa	Maurandya Barclayana coccinea
Gamolepis tagetis	Portulacca aurantiaca
Gaura Lindheimera	Perilla Nankinensis
Gomphrena aurantiaca	Vittadenia lobata

The following Seeds, which he imports annually from the Continent, have always proved very superior, and he particularly recommends them:—

	s.	d.		s.	d.
12 vars. Hamburgh 10-week Stocks	3	6	12 varieties Double Dwarf Rocket Larkspur ...	2	6
12 " autumn flowering do.	3	0	12 vars. finest Zinnias ...	2	6
12 " fine Brompton do.	3	0	10 " Camellia Balsam...	5	0
12 " China Asters ...	3	0	9 " distinct Wallflower	3	6

The above sent free by post, 2s. Bedding Plants of all sorts, well established, at moderate prices. These Catalogues will be forwarded on application; they are all priced and descriptive.

SELECT FLOWER SEEDS.—

Post Free.

TOBACCO PAPER! TOBACCO PAPER!

THE Cheapest and most effectual article for Smoking Greenhouses, and destroying the Fly on Plants, is Genuine Tobacco Paper, which Joseph Baker, of 73, Fleet Street, can supply in large quantities, at 1s. per lb.; and if under 7 lbs. at 1s. 2d. per lb. Post-office Order payable at the Strand Office.

Joseph Baker, 73, Fleet Street, London (opposite the *Dispatch* newspaper).

CURE for MILDEW on GRAPES, &c.—In consequence of the increased prevalence of mildew on the Vines, &c., during the last few seasons, G. Taber, of Rose Cottage, Rivenhall, practical Gardener, Seedsman, and Florist, has directed particular attention to the best mode of preventing it, or for curing the Vines that have been attacked, and he now begs to announce that he has succeeded in preparing a composition known as TABER'S ANTI-MILDEW COMPOSITION, which will effectually prevent or cure the disease without doing the slightest injury to the Vines and any person, by the aid of the printed instructions, may use it without risk. It is also an invaluable remedy for preventing Mildew on Wall Trees, Roses, &c. Sold in packets containing 1 lb., 1s. 3d.; 3 lbs., 3s.; 6 lbs. 5s. 6d., with directions for use. By enclosing two postage stamps, G. T. will send a circular with full particulars as to quantity required for a house for the season, and also testimonials of the success he has met with.

G. T. will personally attend gentlemen, and give instructions to their gardeners at a reasonable remuneration for time and travelling expenses. The trade supplied at the usual discount. Post Office orders to be made payable to George Taber, and drawn upon the Witham Post Office. Postage stamps received in payment of small orders. Packets delivered free to the Witham Station of the Eastern Counties line.—Address George Taber, Rose Cottage, Rivenhall, near Witham.

Sacks and Bags charged at cost price only, and the full amount allowed if returned.

SUTTON & SONS, SEED GROWERS, READING, BERKS.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, &c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidence, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introduced by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant bloomer; and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21*s.*

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gauffred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes. Each 21*s.*

FIRST CLASS NEW VERBENAS.

GEORGE SMITH, in offering the following, warrants them to give entire satisfaction; having this season raised three times the usual number from seed, and with greater success than usual, has been able to select twelve distinct and beautiful varieties, which G. S. flatters himself cannot fail to please.

CALIBAN—Rosy purple crimson, extra large, smooth on the edge and of fine form, has taken First-class Certificates at the National, Brighton, and North London Floricultural Societies.

CLIMAX—Rosy purple, eye shaded with crimson maroon, extra large, of fine form and extra fine show flower.

ANGELINA—Rosy purple, primrose eye, very large, of fine shape. First-class at the Royal Surrey Gardens.

ELECTRA—Bright lilac, fine conspicuous eye, large, of exquisite form. First-class at the Royal South London and the North London Societies.

ISLINGTON RIVAL—Bright scarlet, eye white, flower large and smooth, a free bloomer. First-class Certificate at the National, Brighton, Royal South London and North London.

NOBLISSIMA—Rosy peach, with conspicuous white eye, truss large, of exquisite form. First-class at the Royal South London, also the North London.

FORGET-ME-NOT—Lavender, with large crimson purple eye, a most conspicuous variety, of fine form, extra large and a profuse bloomer. First-class at the Royal South London, Brighton, and the North London.

TRIUMPH—Scarlet crimson, eye white, surrounded with maroon, form exquisite. First-class at the Royal South London, National, and North London.

QUEEN—Pure white, the eye surrounded with bright cherry, pip extra large and smooth. First-class at the Royal South London and North London.

SCARLET KING—Deep scarlet with white eye, fine habit, a free bloomer, flowers large, extra fine bedder.

MAGNIFICENT—A brilliant puce, of fine form, truss large, very free, surpassing all of its class, either a show or bedding var.

ZARIA—Rich lilac, dark eye, large, of fine form, an extra fine variety.

The Set of 12 for 2*l.* 5*s.*, or 6 for 25*s.*, in strong plants, about the 20th of April.

FUCHSIA "TELEGRAPH."

This splendid variety will be found an acquisition. The Plant is of fine growth and habit; the contrast is greater than in any other dark Fuchsia; the tube and sepals are smooth, the latter thick and broad, of brilliant coral red, well reflexed; corolla deep violet, of good size, and circular; quite equal to and distinct from Glory and Nil Desperandum. Strong Plants about the 20th of April, at 10*s.* 6*d.*; with all the leading varieties of Florists' Flowers. Catalogues forwarded in exchange for one postage stamp.

Tollington Nursery, Hornsey Road, Islington, London.

NEW ROSES FOR 1854.

BENJAMIN R. CANT has now ready for sale, strong plants in pots of all the NEW ROSES, some of which have never before been offered to the public, descriptive Catalogues of which can be had on application.

St. John's Street Nursery, Colchester.

WHEELER'S SHORT SELECT SEED LIST.

J. C. WHEELER AND SON'S SEED LIST *is now ready, and will be forwarded free on application. We have tried to make it as short and as select as possible, leaving out all inferior varieties, so that it is really a List of the best Seeds in cultivation. Grasses and other Agricultural Seeds, Garden and Flower Seeds, all described, and prices put to every article. We deliver our Seeds Carriage Free to almost every Railway Station in the kingdom, and take especial care that every sort we send out is true to name, and of the best quality.*

J. C. WHEELER & SON, Seed Merchants, Gloucester.

SUTTON'S GRASS SEEDS.—EXTRACT OF A LETTER FROM DR. LINDLEY:—

"Messrs. SUTTON,—*We have already made a trial of your Lawn Grass Seeds, and it is but justice to say they have proved the best we have sown for many years.*

(*Signed*) "JOHN LINDLEY.

"*Horticultural Society, 21, Regent Street, London, Nov. 9, 1853.*"

Messrs. SUTTON are continually receiving similar letters of commendation of their Lawn Grass Seeds. Price of seed, 1*s.* 3*d.* per lb., 3*s.* per gallon, or 21*s.* per bushel, CARRIAGE FREE, except very small quantities. The quantity required is 40 lbs. per acre, in forming new lawns, or from 10 to 20 lbs. per acre for improving old lawns.

SUTTON'S GRASS SEEDS *for forming Permanent Pasture, 24s. to 30s. per acre;* SUTTON'S RENOVATING MIXTURE *for Improving Old Pastures, 1s. per lb.*

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

RENDLE'S NEW FARMING PRICE CURRENT AND AGRICULTURAL DIRECTORY FOR 1854.

OPINION OF THE EDITOR OF THE "MARK LANE EXPRESS:"—

"We have just seen a copy of this excellent Price Current, and consider it a most valuable companion to the Agriculturist. It is the same size as the garden edition, lately reviewed in this paper. It contains an excellent Almanack, with the University Terms, Eclipses, &c., and a List of Fairs and great Markets held in the four Western Counties. The descriptive lists of Grasses are excellent; they give all the best varieties for permanent pasture, ornamental parks and lawns, sheep walks, heathy and moory lands, &c. Then comes the list of Clover and Turnips, all described in a concise and useful manner. Then follows descriptions of the best Mangold Wurzel, Carrots, and other vegetables used in agriculture: then we have a Price Current of all the best Natural and Artificial Manures, with much useful information relative to Peruvian Guano, Lawes' Patent Superphosphate, Nitrate of Soda, Bone Dust, Bolivian Guano, &c.; then are found some very good advice relative to the purchase of so-called Wheat Manures: but the best Paper is one contributed by J. B. Lawes, Esq., of Rothamsted, 'On the Cultivation of one Green Crop after another on Heavy Land.' This should be read by all engaged in agricultural pursuits. There are some valuable tests for discovering adulterations in manures, by J. C. Nesbit, Esq., the celebrated agricultural chemist; and the report of a lecture by Professor Way on the same subject; then follow the Advertisements, comprising some illustrations of the best implements of the day. It is very well got up, and comprises 52 closely-printed pages, crown quarto size, and we strongly recommend it for the perusal of all engaged in the healthy pursuit of agriculture."

CAPE HEATHS.

W. J. EPPS begs to call attention to his extensive and rare Collection of Heaths, which are in the finest condition possible; very bushy and well formed for specimens in 3, 4, and 6-inch pots, consisting of all the best varieties, such as Aristata ampullacea, tricolor, jasminiflora, ventricosa, Massoni, Webbiana, obbata, &c., &c., 12*s.*, 18*s.*, and 21*s.* per doz. A Collection of 100 varieties, 5*l.*, carriage paid to London. A liberal allowance to the Trade, provided a quantity be taken. All the new and best kinds of Azaleas, Stove and Greenhouse Plants, Fuchsias, Dahlias, Verbenas, and Roses, equally moderate.

W. J. E. has about 200 young specimens of Heath, &c., to part with in 8, 11, and 20-inch pots. Also a Collection of very beautiful Orchids. Lists sent on application.

Nurseries, Maidstone and Ashford.

GEORGE CLARKE begs to invite purchasers to inspect his splendid Collection of ROSES, extending over 10 acres of ground. Fine Standards of the leading kinds, 18*s.* per doz.; Dwarf ditto, 12*s.* per doz. Catalogues can be had.

Evergreens, Conifers, fine trained Peaches, Nectarines, Apricots, &c., at very moderate charges. Strong Dielytra spectabilis, 5*l.* to 10*l.* per 100. Also 100 fine Specimen Erica depressa, which will be sold at a bargain.

Streatham Place Nursery, Brixton Hill, near London.

H. BIGLAND AND Co., in returning their best thanks for the liberal support they have received during the twelve years they have been in business, beg to state that they have disposed of their SEED BUSINESS to Mr. T. F. WINSTANLEY, whom they confidently recommend to their friends, and respectfully solicit for him a continuance of the kind support they have received.

H. B. & Co. will carry on the NURSERY BUSINESS as usual until the stock is disposed of, to effect which, as quickly as possible (their lease having nearly expired) they are prepared to treat with customers on the most liberal terms, and respectfully invite an inspection of their stock at the Nursery Grounds, Whalley Range, where all letters to them should in future be addressed.

T. F. WINSTANLEY, in succeeding to the SEED BUSINESS of Messrs. H. BIGLAND & Co., begs to assure his friends and the public that no exertions shall be wanting, on his part, to keep up the well-earned name of the late firm for supplying their customers with the best and truest Seeds that can be procured, and hope, by strict attention to business, to merit a continuance of the support they have hitherto enjoyed.

Seed Warehouse, 28, Market Place, Manchester.

FLOWER SEEDS.—We have selected out of our large collection of Flower Seeds the most beautiful and showy varieties, each sort distinct in colour, and calculated to produce a fine effect when planted out in beds or groups in the flower border; and we have had each variety distinctly marked with its Botanical and English name, height, time of flowering, colour of the flower, manner of growing, whether erect or trailing, &c., the time it should be sown, and other valuable hints as to its cultivation. In selecting these varieties, we have been careful to exclude all which are shy bloomers, or have an insignificant appearance, so that the collections will comprise only those which are really showy and handsome, and which we believe would prove to the entire satisfaction of any lady or gentleman who might be disposed to order them. The German Stocks and Asters especially are most superb. The Collections will be sent free by post to any part of the kingdom at the following prices:—

Twenty extra fine varieties, all distinct and beautiful, 5*s.*
Fifty ditto ditto 10*s.* 6*d.*

Payment can be made either by Postage Stamps or Post Office Order, made payable to J. C. WHEELER & SON, Nurserymen, Gloucester.

The Gardeners' Chronicle.

SATURDAY, MARCH 18, 1854.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY,	March 21	Horticultural	3 P.M.
		Linnean	8 P.M.
THURSDAY,	— 23	National Floricultural	3 P.M.
SATURDAY,	— 25	Royal Botanic	3½ P.M.

WE must now advert to the further evidence concerning the quality of little known CONIFEROUS TIMBER, which was brought before the last meeting of the Horticultural Society.

Abies Douglasi is one of the hardiest and finest of its order. A native of the vast forests of Oregon, where it forms the common timber of the lowlands, and rises upon the Rocky Mountains till arborescent vegetation becomes impossible, and trees dwindle into bushes, it is peculiarly adapted to this climate. For some years past our cultivated trees have been producing cones, and the plant will become plentiful in the nurseries. No specimen of British-grown timber has been seen; but a native plank was exhibited, which showed its quality to be of the first class among its family. As hard, as firm, as clean as the finest European Larch, bright brown when polished, apparently elastic as the best quality of Spruce, and with little tendency to warp or "cast," it will be found unsurpassed for purposes of strength or ornament, if it is as good here as in Oregon.

Another tree, concerning which no information had been previously gained, was the Corsican Pine. This stately species, unrivalled among Pines for its rapid growth and graceful habit, whence its name *Laricio*, or Larch Pine, has been derived, is reported to produce in the Mediterranean a kind of deal of great excellence, strong, elastic, and well suited for the masts of ships. A correspondent speaks of one in his plantations, 20 years planted, which is not less than 45 feet high, and 3 feet 4 inches in circumference at 6 feet above the ground. A specimen, 23 years old, and 9½ inches in diameter, was produced from a tree which had been just felled in the Society's garden. It proved to be as heavy as Oak, very clean, white, full of turpentine, apparently of great strength, but coarse, and not well suited for joiners' work. In fact, it quite corresponded with what is said of it by writers upon French forestry. Considering that, in addition to its other good qualities, it is a

tree which perfectly resists the action of the sea spray, it seems to be deserving of attention, at least as a shelter for plantations on the coast.

A slice of *Pinus insignis*, 10 inches in diameter, and not more than 11 years old, grown by Mr. T. WREY HARDING, of Upcott, near Barnstaple, appeared to possess no good quality, and to be only fit for firewood.

Cupressus torulosa, a tree called *Soorui* and *Gulla* in the Himalayas, grows on these mountains at an elevation of from 5000 to 9000 feet, in any kind of soil. We learn from Dr. ROYLE that trees of it have been measured frequently 12 to 14 feet, and in some cases 27 feet, in circumference. Although not so hardy as the Deodar, it nevertheless proves to be adapted to the milder parts of these islands. Native specimens of the wood, produced by Dr. ROYLE, showed it to be of good quality, very clean, resembling some kinds of Cedar, and well suited for cabinet work, or for veneering.

In our judgment these specimens possessed much interest with those who in planting desire to know what the ultimate value of their trees is likely to become. Doubtless home grown timber would afford more conclusive evidence; but, in its absence, proof of this kind, the best that is procurable, is surely of great importance. Nevertheless, it would seem from some remarks by Mr. STRICKLAND, which appeared in our last Number (p. 149), that it is wholly insufficient. This gentleman continues to believe that Deodar timber, although excellent in India, will be worthless here. We do not know that much can be added to what we have already said upon that subject. Undoubtedly till old Deodar timber shall have been felled in England, there is no absolute *certainty* that its quality will be equal to that of India. We must, however, persist in thinking that the balance of evidence is entirely in favour of the affirmative; nor can we attach any weight to the arguments which Mr. STRICKLAND now relies upon in support of the opposite conclusion. He has been so kind as to send us a fragment of Cedar of Lebanon wood, brought by himself from Syria, and it is now before us. It is like that of the branch formerly mentioned as having been obtained at Chiswick, but is certainly more fragrant; by no means, however, so much so as the Deodar. And we think we can perfectly match it with wood of the same kind now before us, from good Cedar land, both at Highclere and Bowood. We therefore do not regard the Mount Lebanon Cedar as a proof that the quality of this tree deteriorates in *suitable soils* in England. Why, then, should the Deodar? Mr. STRICKLAND imagines that the fragrant unctuous planks of Deodar wood imported by the East India Company "were cut out of the heart of very old trees." We assure him that such is not the case; they are complete sections of the entire trunk, sapwood as well as heartwood, excepting the bark, which had come off. He also infers that, because American Larch forms inferior wood in England, though so good in the United States, therefore no inference is to be drawn from similarity of climate. We never saw, but should much like to see, English specimens of this Hackmatack; the tree is rare in England, but we should be surprised if its quality *were* good. As far as we know anything of it, our climate does not agree with it any more than it does with many other trees from the United States. We want their burning summers, as much as their savage winters; and hence the unwillingness of many trees to assume with us their natural character. But we may illustrate the question before us in a different, and, we believe, a more satisfactory manner. The common Walnut tree is Himalayan; it grows in Asia in a climate like our own. Can it be shown that Himalayan Walnut wood is better than English? Or, if better, in any degree of practical importance? Probably some of our readers may be able to answer the inquiry.

We really are not anxious to get up a case in favour of the Deodar; we are only desirous that due weight should be given to ascertained facts, and that the public should not be led to undervalue what, as far as our personal experience goes, is good presumptive evidence. We see that, *cæteris paribus*, English Cedar is as good as Syrian, that English Laricio is as good as that of Corsica, we believe that English Walnut wood is as good as that of Cashmere; and such being the case, we are unable to believe that English Deodar or Douglas Fir timber will be inferior to that of Oregon or North-Western India.

MR. GASSIOTT, an eminent importer of PORTUGUESE WINES, to whom we have before been indebted for very interesting information, for the acquisition of which (from his connections at Oporto) he has peculiar facilities, has just favoured us with some drawings and notes illustrative of the present state of many of the Vines in that district. The roots emit a strong putrescent smell, showing unquestionable symptoms of disease; the pith below the "knots" is pulpy, and in a state of decay, though that above the "knots" is healthy, and the ducts which in sound shoots are nearly colourless assume gradually a deep vinous tinge, commencing in isolated spots, but soon running all round, and at length investing the whole course of the cavity, while a few fainter lines cross the medullary rays themselves.

Unfortunately, for the present, we are without specimens, and may therefore run the risk of committing some error, in our deductions from the facts before us; but judging from the known history of other plants which have suffered from fungals, we are far from being surprised at the information. In the Turnip, for instance, or Potato, under the influence of *Botrytis parasitica* and *Botrytis infestans*, the ducts and spiral vessels are constantly more or less discoloured, the discolouration often running down for a considerable distance amongst tissue which is otherwise uninjured. As the change of colour is due to a chemical change of the cell walls and their lining threads, or membranes, from their ordinary healthy condition to humates and ulmates, it is not very easy at first to see why cavities which, when arrived at their full growth, in consequence of the absorption of the protoplasm, contain gaseous matter only, and from the dryness of the walls apparently less obnoxious to any putrifying agent, should be amongst the first to suffer, except possibly from the circumstance of their individual length being so much greater, or even where the original constituent cells are short — the canal being virtually one from the actual perforation of their diaphragms, whether oblique or horizontal. As regards the condition of the pith, it must be regarded as indicative of deep-seated mischief; for though the new bud does not depend for its support upon last year's pith, the cells of which in spring are effete and almost void of any nutritive matter, except a few scattered grains of starch—a state of actual decay, in consequence of which the portion nearest to the new bud is in a pulpy condition, must inevitably prove injurious to the young surrounding tissue with which the bud is in connection, and from which it is mainly supported. It is scarcely possible that such branches should produce healthy shoots; and even should the hopeful anticipations of the Vine grower, from the severity of the past winter, be happily realised, it will be some time before the Vineyards can recover their former health and luxuriance. *M. J. B.*

VEGETABLE PATHOLOGY.—No. XI.

40. In all phænogamous plants there are two opposite systems of growth—the one ascending, the other descending. To the former belongs the root, with all its ramifications, and to the latter the stem, with its appendages. In many cases the directions of growth are strictly vertical, deviations depending upon circumstances accidental to particular species.* It is curious, however, that in the embryo the original direction of the point, by a prolongation of which the root is formed, is exactly contrary.

41. In speaking of the descending system, we must be careful not to confound very different organs with true roots, merely from the circumstance of their being developed under-ground, some of which are mere underground shoots, which run for a distance beneath the soil, and then break through, by means of their pointed tip, which gives rise to a new plant, as in the common Couch Grass; in other cases swellings take place in such shoots, and become reservoirs of nutriment (tubers), intended to serve for the propagation of the plant in the following season, as in the Potato or Jerusalem Artichoke; in others, again, the lower part of the axis of the plant swells out, forming what is called a corm, as in the Crocus, or the bases of the leaves, as in bulbous plants, but none of these are true roots. The primary office of the latter is to absorb moisture from the earth by means of the spongy mass at their apex, and in an early stage of growth from their surface also, which not only is capable of absorbing a certain quantity of fluid, but, in order to increase the points of absorption, is frequently clothed with extremely delicate hairs, which may be found in most plants, especially where the exigencies are increased by more than usual want of moisture. The swollen roots of many terrestrial Orchids† present good examples of this sort of clothing, as they do of their capability of being converted into reservoirs of nutritive matter for the supply of the next year's growth.

The large swollen threads in the genus Crocus, especially in Crocus Imperati, which occur amongst the ordinary fibres, are also direct examples of the same formation. The following illustration, borrowed from the "Journal of the Horticultural Society," explains this statement.

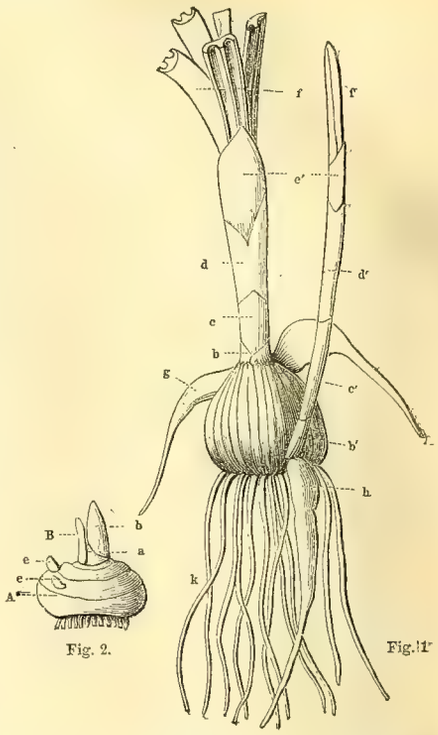

Fig. 2. Fig. 1

CROCUS VERNUS.

Fig. 1. Base of plant in spring.

Fig. 2. Corm deprived of its coats in autumn.
A. Corm.
B. Remains of old peduncle.
a. Lowest sheath of principal bud.
b. Second do.
e, e. Accessory buds in axils of lower leaves of last year.

42. A vascular bundle, surrounded by or embosomed in bast cells, occupies the centre of the first root and stem, if not at least at the first moment of their growth, a short time afterwards; and all roots produced at a later period spring from this bundle, from some of its ramifications, or from new vascular tissue formed in the alburnum—at first, in the form of a little papillæform projection, which gradually penetrates the superincumbent cellular matter, and is elongated when free into a true root. As the vascular tissue is formed by a transformation of the bast cells, it is not visible at first, but there is always at length a direct contact, though not always a direct communication between that of the root and the parent bundle. The vessels of the root are frequently of a different character from those of the parent bundle. The first, for instance, may be truly spiral, annular, or scalariform tissue, while that of the latter is only scalariform or otherwise. In many cases, however, the vessels of the parent bundle actually branch into the bundle of the root, as may be seen very clearly in the roots of the common Leek. In those cases where roots are produced under anomalous circumstances, as from the broken petioles of Celery leaves, they arise equally from vascular bundles, and in this case also, as mentioned above, we have observed the spiral vessels to be much distorted and branched (see No. 28, in note). Indeed, it is probable that true roots are never produced where there are not pre-existent vascular fibres; and if so, it is clear that it is hopeless to attempt to raise plants from cellular tissue merely, and that Turpin's notion of the possibility of raising a phænogamous plant from a single cell is wrong, both theoretically and practically.*

43. In the roots of Exogens, as in the stems, there is an Exogenous mode of growth, and the tissues, consequently, of the bark and wood of the roots are subject to the same laws. As, however, the active part of the root is confined after a short period to the tip, it is clear that, in many instances, even where there is a tap root, the point of the first root will not be produced indefinitely, as is the case with many Endogens, but that the exigencies of the plant will be supplied by laterals, and the greater the number of these the more active will be the imbibition of nutritive matter, other things being equal.

44. As the roots equally with the stem are threaded

* In the Celery leaf figured under No. 28, the roots spring from the lower lip of the fracture, and are consequently directed upwards; but this may have arisen from some accidental deflection of the leaf, as the plants had been injured by the fall of a branch.

† It is true that Schleiden and some others consider these roots as parts of the axis, but this view, however ingeniously supported by arguments, is so clearly wrong, that we have no hesitation in considering the matter as a fact which does not require discussion. The new bud arises from the same vascular bundle, but that is very far from being a proof that the organs in question are not roots.

* In those cases where on a vertical section there is no apparent connection between the vascular tissue of the root and that of the alburnum, if a section be made parallel to the alburnum a lateral connection may be traced. A good illustration of this will be found in Trécul's memoir on adventitious roots, in the third series of "Annales des Sciences Naturelles," vol. vi. We are unable to say whether adventitious roots ever arise from vascular tissue when present in the bark; but as buds do occasionally under such circumstances, it is probable that the same may be true of the roots.

with ramifications of the main vascular bundle, or of the new vascular bundles of the alburnum, from which not only roots and buds but appendicular organs derive their origin, as is evidenced by the extension of their ramifications into those organs; under certain circumstances, as when the stem is injured or cut off, or even without any injury in plants peculiarly subject to produce buds, roots are capable of sending up shoots to multiply or replace the parent. In the few phænogamous plants where vascular tissue does not exist, or is very rare, the central tissue must be supposed to take its place. In cases where root-like appendages are mere prolongations of the external cells, or evidently are generated by them, as in many cryptogamous plants, and the hair-like threads which clothe the roots of phænogams, there is of course no question of any such connection.

45. As the root under certain circumstances is capable of giving rise to the buds, so does the stem on the contrary frequently produce roots, instances of which must be familiar to everybody, as at the base of Grasses, in Vines, on the stems of climbing parts, such as Ivy, &c. The most striking instances, however, are those of many Figs and Mangroves, where stout aerial roots descend from the stem and support the plants.* It should seem, however, that root-like organs produced under the influence of disease are not always true roots. At least, such appears to be the case with a sort of gall produced in the stems of Grasses, the structure of the root-like processes differing from that of the true roots of the mother plant. The subject has been lately investigated by M. Prilleux, and the results published in the "Annales des Science;" but the relation of the vascular bundles of the stem is not indicated so as to leave the matter entirely free from doubt. The root-like processes on the stems of our native climbers are small and of little importance; not so those of many exotic plants, in which, as in Wightia, a large arboreous climbing Figwort, they are very strong, and clasp the stem on which they grow, till they at last completely destroy it. A beautiful illustration of this is given by Dr. Hooker, at vol. i., p. 164. *M. J. B.*

IRISES.

As these form one of the most interesting and beautiful groups of hardy perennial herbaceous plants we have for the ornament of shrubberies and flower gardens during the spring and early-summer months, I have ventured to direct attention to a few of the best of them. The brilliant tints and graceful disposition of the individual blossoms, in connexion with their adaptation to almost any aspect and quality of garden soil, bespeak them worthy of more extended notice than they have hitherto received. The characters, &c., of the kinds now enumerated are drawn from specimens growing in a rather retentive loam, upon a dry substratum.

1. *Iris acuta.*—This is a neat, slender-stemmed species, which grows from 2½ to 3 feet high, with narrow lanceolate-acuminate leaves, from 12 to 16 inches long, and numerous terminal panicle-like clusters of conspicuous, medium-sized, rich blue blossoms (borne on erect slender flower-stems), having the lower decurved sepals or flower petals banded or striped with bright blue lines upon a pale white ground, and terminating at the extremities with entire blue, the central disk of each being prominently margined with brownish yellow.

2. *I. pallida odorata* is a fine species, of robust habit, attaining the height of from 2 to 3 feet, with broad sword-shaped leaves, and remarkably large and conspicuous broad-petalled porcelain-blue blossoms, from 4 to 6 inches in diameter, the lower decurved interior sepals having a very beautifully bearded crest along the central disk, coloured with rich orange towards the extremities, and margined with pale-green streaks. The flowers being often borne on successive tiers or clusters upon the elevated flower scapes, produce a stately and elegant effect.

3. *I. prismatica.*—This is a remarkably neat, slender, erect species, from 1½ to 2 feet in height; it approaches to I. graminea in habit, but it is readily distinguished from most other species by its very compact and bushy, yet erect growth, dark green, somewhat rigid lanceolate leaves, and a profusion of conspicuously bright, sky-blue flowers, the lower sepals being elegantly banded with transverse blue lines upon a pale ground.

4. *I. amœna.*—This compactly growing species attains a height of from 1½ to 2 feet, with broadly-lanceolate leaves, suffused with purple at the base, and racemes of comparatively large blossoms; the upper incurved petals being pale white, contrast well with the dark blueish-purple on the extremities of the lower ones, which are elegantly streaked with purple on a pale ground towards the base, and picturesquely marked with a longitudinal pale yellow bearded crest along the central disk.

5. *I. spuria, var. ochroleuca* is a robust and stately growing variety, varying from 3 to 4 feet in height, with broadish lanceolate leaves, tall erect flower stems, and extremely beautiful large clear white blossoms from 6 to 8 inches broad, the lower decurved sepals marked with a very rich lemon-coloured blotch. The singularly elegant and conspicuous blossoms of this ornamental plant, terminating the summits of the tall flower-scapes, are seen to great advantage, when contrasted with the darker background of select evergreens.

6. *I. sub-biflora.*—This is perhaps the finest of the dark-flowered species hitherto introduced. It is a luxuriant growing kind, of rather diffuse habit, reaching from 1½ to 2 feet in height, with broad sword-shaped leaves, and large rich deep purple blossoms, nearly 6 inches in diameter.

7. *I. florentina.*—Of similar habit to the last, to which it offers a very striking contrast in its large and conspicuous creamy-white blossoms.

8. *I. germanica* is an ornamental species, growing 1½ foot in height, with broad lanceolate leaves, and numerous large, conspicuous, pale azure-blue flowers, from 4 to 6 inches in diameter, forming an elegant object in the medium foreground of select shrubberies or flower-borders.

9. *I. pumila;* 10. *I. cristata.*—These rank amongst the dwarfest of the genus, being from 4 to 6 inches in height, and producing comparatively large and conspicuous blueish-purple blossoms in the early spring months; they are well adapted for front effect in smaller compartments or parterres.

I. pumila alba is also a desirable early spring-flowering variety, of dwarf habit, forming a pleasing contrast with the last-named species, its creamy-white blossoms, marked with pale purple on the lower decurved sepals, being very pretty. *William Wood, the York Nurseries.*

CLERODENDRON SPLENDENS.

There is hardly a more beautiful or useful plant in cultivation than this Clerodendron; for, under good management, its large clusters of brilliant scarlet blossoms are produced in great profusion, and they last a long time in perfection. Unfortunately it can never be everybody's plant, for it cannot be grown with advantage except where it can be furnished with plenty of heat and moisture during its growing season. Where there is convenience, however, it is well worth attention, and will be found to amply repay any amount of trouble which may be bestowed on it.

It may be readily propagated by cuttings made of short-jointed young shoots, selected in a rather firm state, inserted in sandy, peaty soil, covered with a bell glass, and afforded a brisk bottom heat. It may also be increased by grafting it on any of the stronger growing varieties; but, although this plan was at one time much recommended, it has now, I believe, fallen into disrepute, the plant having been found to do quite as well on its own roots. The young plants should be potted singly in small pots, as soon as they are sufficiently rooted to bear handling, and replaced in bottom heat, in a moist, warm situation. When well established, shift into other pots, two sizes larger, and keep them as near the glass as is convenient, in order to induce the production of strong, short-jointed wood. And during the growing season, continue to afford them a brisk bottom heat of 85° or 90°, with a warm, moist atmosphere, and all the light possible, merely guarding them from the direct rays of the sun on the forenoons of bright, warm days. Do not keep them growing too late in autumn, however; rather endeavour to have the cuttings rooted early in the season, so as to get strong, well-furnished plants by autumn, when they should be removed to a drier atmosphere, gradually withholding water from the soil, with a view to get the wood well ripened. And I may observe that upon this, and the plant being allowed a period of rest, future success greatly depends; for unless the wood is properly ripened, and the natural season of rest afforded, there will be no possibility of getting them to break strongly or grow vigorously; but if these particulars have been properly attended to, they will grow equally well whether started in June or March, and form splendid plants for blooming in a warm house during winter. If, however, your young plants are intended for blooming in summer, water should be gradually withheld towards the middle of October, and they may be removed to their winter quarters by the middle of November, which may be a corner of the stove, or to any dry situation where the temperature may average from 50° to 55°, and no water should be given to the soil during the resting season. About March turn them out of their pots and shake away as much of the soil as can be done without injuring the stronger roots, and repot in not over-large pots, using good fresh turfy loam, rich fibry peat, and leaf soil in about equal proportions, well intermixed with plenty of sharp sand to secure rapid drainage, cutting the shoots well back to strong prominent eyes. After potting plunge in a sharp bottom-heat, and maintain a moist atmosphere by frequent syringing, but carefully avoid overwatering the soil, until the plants fairly start into growth.

The shoots may be loosely trained to stakes until the plants can be shifted into their flowering pots, when light wire trellises may be applied, so as to enable them to be kept neatly and regularly tied. There is no danger of overpotting a plant like this, for with good management, plenty of light, and the command of heat and moisture, it will fill a 20-inch pot, and form an immense specimen in the course of a few months, or it will bloom nicely in a 12-inch pot, forming a handsome moderate sized plant. Therefore, the size of the flowering pots may be regulated by circumstances, the only difference being that the plants will bloom earlier and their beauty will be shorter lived in small pots, and *vice versa.* If a large shift is given, however, be very careful not to give too much water to the soil, until the roots reach the sides of the pot, and when this is the case a liberal supply of clear manure water should be administered. Keep the shoots regularly trained to the trellis, and continue to keep up a brisk bottom heat, with a warm moist humid atmosphere, until they are fairly in bloom, when they may be gradually prepared for removal to the show-house; and if this is done carefully, and they are afforded a close corner not exposed to draughts, they will continue to unfold their brilliant flowers for a very long period. By taking care to get the wood well ripened, affording the plants a period of rest, and disrooting, &c., as recommended above, the specimens will last for any number of years. *Alpha.*

Home Correspondence.

Dacrydium Franklini.—It is stated at page 151 that two thriving plants of the "famous Huon Pine" of Van Diemen's Land are growing in the New Zealand house at Kew. It may, therefore, be interesting to know that at this place (which is by no means favourable for acclimatising plants) a tolerable specimen of this singular plant—growing on the open lawn, in a situation of much exposure to the northerly and easterly winds, and having only had the advantage of a slight protection of Spruce Fir branches during the intensity of the frost—has stood the winter comparatively uninjured, a few of the extreme tips of the branches only being destroyed, and even this may in some measure be attributable to the circumstance of a late growth having taken place, induced by the functions of the plant having been deranged during the process of planting in early summer, and the continued wetness of the season. *James Duncan, Basing Park, Alton, Hants, March* 15.

Water about the Roots of Ash Trees.—I have a fine Ash in a conspicuous place, ornamented with Ivy. During rainy seasons, the surface of the soil is covered, to the depth of 1 or 2 feet, by a stream of water. Shall I be in danger of injuring either the Ash or the Ivy by making such an alteration in the stream as to raise the water constantly to this depth? *Charles Fox, Wellington.*

[You will no doubt kill both.]

Exterminating Ants.—If "S. B.," Dublin, waters his ground well with gas-water, he will soon rid it of the little pests he complains so much of; for gas-water destroys all vermin wherever it is used. Let it be fresh, and apply 3 gallons of it to 24 square feet of ground, through a medium-sized rose watering-pot. Turf may be laid down two weeks after the water has been applied; but if the ground is to be sown with Grass seed, four weeks should be allowed to elapse after the application. By no means use gas-water on turf, for it will be sure to kill the Grass. *J. H. T.* [No.]

Hartley's Rough Plate Glass.—As my name has been introduced on the subject of the above description of glass, I feel called upon, as a matter of justice to all parties, to give my experience as to its qualifications, which I will do in as few words as possible. About the autumn of the year 1850, I was induced, from the high character given to it, to have a Camellia-house glazed with it, thinking that it would want no shading, and be all that was required for Camellias and Rhododendrons. At the end of the summer of 1851, in spite of frequent shading, I found the Camellias much marked, not burnt in spots as with sheet glass, but rather delicately roasted like, but more brown than the few leaves which I enclose for your inspection. I was disappointed, but I did not complain, for I thought it might be owing to something peculiar in the weather, or the angle of the roof; in short, I did not know what to think. The summer of 1852 came, and had nearly passed, and my Camellias were still being roasted, although in very sunny days the house was regularly shaded, so that at the end of the summer I was quite disgusted; but I did not publish my complaints, for I am not a young hand, and well know how many good things and good practices in gardening have been too hastily complained of and written down. I made known my complaints, however, to Messrs. Phillips and Co, from whom I procured the glass; they immediately paid me a visit, and pronounced the glass of inferior manufacture, offering at once to replace it with good glass from Messrs. Hartley. They did so in the autumn of 1852 with a nice even sample, with small flutes, very regular and good. Last summer (1853), as is well known, was a continual autumn; there were many more cloudy days than sunny ones, still the roasting continued, but not by any means "as bad as ever," to quote the words of your correspondent (if these words were used here recently, they were expressed incautiously, but I cannot find, on inquiry, that any person here remembers having used them). I certainly thought when the rough plate glass was introduced, that for Camellias it would require no shading, and would, indeed, be perfection. I have been disappointed in not being able to grow Camellias without shading; but I cannot disbelieve the reports of many of our first-rate gardeners as to its eligibility for forcing houses. Permit me now to express my opinion on the different descriptions of glass. For orchard-houses, and structures of that de-

* An interesting account will be found in Dr. Hooker's Himalayan Journals of the manner in which the great Banyan tree of the Calcutta Botanic Garden, of which it is the pride and ornament, has been improved by Dr. Falconer. "The props are induced to sprout by wet clay and moss tied to the branches, beneath which a little pot of water is hung, and after they have made some progress they are inclosed in bamboo tubes, and so coaxed down to the ground. They are mere slender whipcords before reaching the earth, where they root, remaining very lax for several months, but gradually as they grow and swell to the size of cables they tighten, and eventually become very tense. This is a curious phenomenon, and so rapid that it appears to be due to the rooting part gradually dragging down the aerial. The branch meanwhile continues to grow outwards, and being supplied by its new support thickens beyond it, whence the props always slant outwards from the ground towards the circumference of the tree." In some species of Fig, these roots are so strong and abundant, and at the same time pliable, that bridges are formed over rivers by connecting the roots of trees situated on the opposite banks. A very pretty figure of such a bridge, in Khasia, is given by Dr. Hooker in his second volume, p. 269.

scription, where abundant ventilation is secured, no better glass than good 16-oz. sheet glass, such as can be purchased at 3*d.* or 3½*d.* per foot, need be wished for; for early forcing houses, which in early spring cannot be ventilated, so as to prevent scorching, Hartley's rough plate or double crown should be employed, for 16-oz. sheet glass is very apt to burn. I believe it almost impossible to prevent 21-oz. sheet from scorching terribly, as I think Mr. Roberts, of Raby Castle gardens, can testify; we may therefore reckon the rough plate and double crown as the two descriptions of glass the best adapted for all houses in which forcing is commenced in November, December, or January. When forcing is commenced later, so that plenty of air can be admitted, 16-oz. sheet answers well, as I can testify, for I have four houses glazed with it full of Roses just coming into flower; their foliage is beautiful, and not a leaf has a speck. For ornamental plant-houses the double crown glass (unless the luxury of plate glass can be indulged in) is, in my opinion, the best of all; it is about the thickness of rough plate, and as nearly as possible the same price. I have one house, 60 feet by 10, which was glazed with it about five years ago, and I have never yet had a scorched leaf in it, and not a square has been fractured by frost. I procured it from Messrs. Phillips, I think on their recommendation, and I cannot help saying that the clear light given by this glass in winter, spring, and autumn, when greenhouses and conservatories are mostly resorted to, is much more agreeable than the subdued railway-waiting-room light given by rough plate glass. The double crown glass is particularly clear; and when I am in my greenhouse I like to be able to look out and around, and to see the clouds and the sky, in preference to having my sphere of vision confined to the interior. This is, however, only a matter of individual taste. It may, perhaps, be useful to point out to your readers the most eligible purposes to which the different descriptions of glass may be applied. Hartley's rough plate for early forcing houses, forcing pits, frames, and Orchid houses, unless as a matter of taste the clear light given by double crown is preferred. Sixteen ounce sheet for orchard houses and others where late gentle forcing only is employed. Double crown for ornamental plant houses, crown for the same purposes; if the price for double crown be an object, both the descriptions of crown glass are perfectly clear, and (ought to be) free from foci. It must be recollected that rough plate and double crown are very strong, and can be used in pieces 20 inches by 12 or 15. Where the sash bars or rafters are 20 inches apart, 16 oz. sheet may be used of the same dimensions without fear of breakage by snow. Crown will not bear more than 8-inch sash bars. *Thomas Rivers.*

The "Open Spade," described by Mr. Walters, at p. 134, as a new invention, has been in use in this place for half a century. There is a person here, now verging on 90 years of age, who has used it ever since he could dig, and I have it myself in constant use. It is in every respect such as is described by Mr. Walters, and is here known by the name of "digger." It is considered to possess the advantages pointed out by Mr. Walters, being more easily used in heavy lands than the ordinary spade, though less so than the fork, which has also long been in common use here. It is, however, preferred to the fork in one respect, namely, that it cuts the roots, &c., which elude the fork. I do not write for the purpose of depriving Mr. Walters of the credit of his invention, but only to show that others had thought of the same plan very long ago, and to attest the real usefulness of it. *T. B., Selborne, Hants.*

——The open garden spade, described by Mr. Walters, is nearly as common in some parts of Sussex and Kent as the common garden spade. I can confirm all that has been said of its utility in stiff soils, and in the "drawing" of forest trees and large shrubs. Its price is, however, quite double that given by Mr. Walters. It has been known here and in Sussex for generations by the name of mule. We have here and in Sussex an implement which I have not seen in general use anywhere else. I think it the most useful implement for drilled crops on a small scale I ever saw. Every cottager who has but a pole of land has one. It resembles the lower part of an Asparagus fork, and has a handle like that of a hoe. It is used for chopping between crops of all descriptions, both on the farm and garden; it is called the Canterbury or spud hoe. *W. H. R., Tunbridge Wells.*

Collodion (see p. 132).—In answer to the question as to whether or not this will stop the bleeding of Vines, I beg to state that I have used it most effectually for that purpose, on our late pruned Vines here since 1852, and I am at present trying what effect it will have in curing the canker of fruit trees. My attention was called to it by Dr. Dalziel, of Penpont, who has used it for years before the date just mentioned, when pruning his fruit trees. Dr. Dalziel prunes his wall trees at any time that is most convenient, and immediately applies collodion to the wounds. His trees are in good health, and annually bear fine crops of fruit. He was also among the first (if not the first) in this part of the country, who employed collodion in his own profession. *James M'Intosh, Drumlanrig Gardens, March 7.*

Hartley's Rough Plate Glass.—My employer having resolved on building two Vineries in the spring of 1852, Hartley's rough plate was chosen for the roofs, in sizes of 36 inches long by 7 inches broad, and well-selected, sheet of the same sizes for the ends and fronts giving the houses a clean, neat, and substantial appearance, as soon as they were finished, which was in the beginning of May. The young Vines were planted; they made excellent wood the same season, some of the shoots measuring from 12 to 15 feet long; and, with the exception of a few leaves together under one sash (which at first I thought was the result of airing having been too long delayed some morning), all the rest continued perfectly healthy and vigorous throughout the season. In autumn the rods were cut well back; and last spring, when the young shoot on which the leaves were scorched the former season had advanced the same distance up the rafter, viz., about 6 feet, its foliage there was again affected; while, as before, all the other leaves continued healthy. This scorching at the same spot a second season caused me to examine the glass minutely in that part of the house, when I discovered that one piece differed considerably from the rest, in having many hundreds of very minute spots or blisters, the largest of which did not exceed 1-16th of an inch in size, and which individually I do not think could form foci, but from so many hundreds of them being together they do so. On examining the roofs of both houses, however, I only found another piece which I could suppose might cause burning. After the first year's trial I was so well satisfied with the result of Hartley's rough plate that I extended it to pits under which I had Melons, Cucumbers, and Strawberries, and last season all of them gave the greatest satisfaction; so that by means of a little care on the part of the workmen while glazing, to lay aside such pieces as I have described, rough plate will be found to merit all that has been said of it. Owing to its thickness it retains heat longer, requires less air, and is not liable to break with frost in winter. Living in a very cold northern part of the country has given me ample experience on this latter point. During the past winter, when on the 3d of January the thermometer was 3° below zero, not a pane of Hartley was broken, while in a greenhouse which had originally been glazed with crown glass, upwards of 50 squares were broken; in sheet glass the damage has been considerably less. *R. Farquhar, Fyvie, Aberdeenshire.*

Deep Soiling Potatoes.—Among the various methods suggested for the prevention of disease, none appears more worthy of attention than that proposed by your correspondent, Mr. Aldborough, at p. 107. It consists of two operations—first, digging out a trench between the rows, and secondly, laying the earth upon the top of the plants. More attention, however, appears to be directed to covering over the Potatoes with the soil (perhaps with the view of protecting them from atmospheric influence) than to trenching between the rows, which would have the opposite tendency of allowing access to the air, and promoting the dryness of the bed in which the tubers rest. In the absence therefore of any experiments upon the effects of either of the above operations performed singly, I would submit that the efficacy of the process is due to the trenching rather than to "earthing over" the plants, the effects of the former being more agreeable to those conditions which are known to be favourable to the production of healthy tubers. *G. P. S.*

Forcing Seakale.—Your correspondent, "S. S.," (see p. 133), is of opinion that the quantity of soil I recommend for growing this plant in is insufficient, and that reducing the roots injures the coming crop. "S. S." has, however, mistaken the depth of soil recommended. In the first place, it is to be spread over the fermenting material, to the depth of 6 or 8 inches, upon which the roots are to be placed perpendicularly, and, as before directed, filled up to their crowns with the same compost. "S. S." will thus see that the soil first placed on the bed is 6 or 8 inches, and that the remainder is the same depth as the root, which is advised to be 8 or 10 inches in length; therefore, instead of there being only 6 or 8 inches provided for the young fibres to ramble in, there are 16 or 18 inches. The next point is that of cutting away all superfluous large roots, forcing none which have not a crown at their extremity. "S. S." says correctly that the London market gardeners are very careful to preserve the roots. But it is well known that our market gardeners are not so famous in the production of this delicious esculent as they are in that of most other vegetables, or forced Seakale would be in reach of the middle classes of society, which it cannot be said to be in January or February at present. Not every tradesman will choose to give half-a-crown for a dish of Kale, and there is no reason why good Kale should not be obtained at 1*s.* 6*d.* at such periods; but, by managing it as I direct, it may be, and with profit to the grower. "S. S." considers that cutting away the roots, as described, deprives the plant of its chief maintenance, but I can assure him there is sufficient left to perfect the crop. This is my experience, or I would not make the statement. We tried a frame of one light, with the roots pruned, and a frame of two lights, with them untouched; the one-light produced much more in proportion than the other, being capable of holding more crowns, and they were not half so much drawn. *A. Bundy.*

Meudon Strawberry.—My gardener induced me, last November, to let him advertise this valuable fruit in his own name, for the benefit of the school in which he was brought up; but as there is often much charlatanry in use on such occasions, people are chary of giving confidence where pretensions to merit are not well authenticated. I feel strongly the advantage the gardening public would derive from the cultivation of this Strawberry, and herewith beg to give you its history. Meudon, as you know, is one of the Royal Palaces near Paris. Its garden, at the time I speak of it, was occupied by a horticulturist, who gained much celebrity in the *Chronicle* by his successful mode of growing Pine-apples in peat. Being curious to witness the fact, I visited Meudon, and found all that had been stated realised. But I at the same time saw what France heretofore did not possess of its own, viz., a splendid-looking Strawberry, which was being forced on shelves at the back of the Pine pits. The gardener told me it was one of his own raising, and seeing how abundantly it bore in small 6-inch pots, and how beautiful it looked, I induced him to let me have one plant out of the small stock he possessed. I brought it home with me to England, and the stock I now have of what I call the Meudon Strawberry is derived from this single plant. The fruit is as large as that of Keens', but conical and of a light red—solid, juicy, and sweet, with a quick flavour; excellent for dessert or preserving, and an abundant bearer under all treatments. My gardener has a considerable stock of this Strawberry left for disposal in small quantities, in order to its more general dispersion, as I should be heartily glad to see it become one of the staple plants for general cultivation, and I thus willingly lend the good man my advocacy, accordingly. *Wm. Mason, Necton, Norfolk.*

London Squares.—The chief use of the London squares is for ladies and children to take the air in, free from annoyance. They should be, therefore, at all possible times, dry and airy; they are the nuclei of the dampest fogs in town, worse than the streets; everyone knows that trees and shrubs especially attract moisture. A town square should be a formal Italian garden of the simplest kind, Grass, gravel, and a few very large vases at the intersections of the wide rectangular walks. In the heat of summer no one is in town, and therefore does not require shade to exist there. Instead of railings, which are always an eyesore, a simple 6-foot wall, with Grass slopes towards the centre of the square, is what is wanted. *Somerset.*

Eastern Cypresses.—The Cypress of Affghanistan, regarding which I observe an inquiry in your Paper of March 4, is the common cultivated Cypress (C. sempervirens), which is a favourite tree in all parts of the East. The trees in the garden at Neemla (between Jellalabad and Cabul) are well known for their size. No other Cypress grows in Affghanistan, which is much too dry for the Weeping Cypress of China and Sikkim. *Thomas Thomson, Kew.*

Food for Working Men.—The allowance of Rice to the Crewmen in British employ at Sierra Leone was just one quart, full measure, daily. The Crewmen formed messes or gangs, and one of their number, generally a youth, full of humour and comicality, shelled the grain of the mess in a hard-wooded mortar, aided by a heavy pestle of the same material. The shell was close and compact, and the loss in shelling was very small. The Crewmen boiled the Rice in a large iron pot, "to a turn," then poured off the water, and steamed the grain for a minute or so, dry, over the fire. The Rice was then poured, the grains tumbling over one another, into a large calabash, when the happy group seated round, each man on his hams, formed the Rice into balls, rolled it in Palm oil, then dipped it in a mixture of salt and red pepper, and swallowed it with a gusto indeed. Each grain was perfectly cooked, *croquant* and firm, and not in the least mashy. When the Crewmen had a little fish or game, or a bit of meat, which happened often, they ate it with their Rice. It was quite as pleasant, and far more novel, to see these joyous fellows eat, as to witness a lord mayor's feast. The Crewmen do not bring their women with them, but the other tribes, Mandingoes and the rest, also pound their Rice, usually allotting the cheery task to the young girls. Many a time I have gazed at these ebon Hebes, with their graceful, elastic forms, their rounded shoulders, thanks to the Anglo-Irish rule which shielded them, undefaced by the cruel lash, as they shelled the snowy Rice, keeping time as the measured stroke came round, with some wild chaunt. These negroes, it must be confessed, are vastly better cooks than our English, Irish, or Scottish peasantry; or than the latter, short of sustained systematic teaching, can become. Their Rice, as I have already said, is done to a turn; and when the curry of fowl, or fish, or meat is poured on the hot, smoking, fragrant, snowy mass, the food is fit for a king. The whimsical notion of mashing Rice in a huge quantity of water, and calling it food, has never entered their noddles. They would not eat such wishy-wash if it were offered them! English, Irish, and Scottish cooks rarely boil Rice properly. It is mere chance medley with them. Either it is half raw or it is mashed. Educated people, even, under the influence of the best of motives, advise Rice to be boiled for hours, whole hours! Now, by careful experiment, I have reduced the matter to a perfect certainty. It is a thing well worth knowing to those who eat Rice, or would have others to eat it. Thirty minutes in boiling water, just one half hour, tied loosely in a napkin or otherwise, serves to prepare Rice for eating with butter, or treacle, or sugar, or milk, or the curry. Rice and curry is served at most tables, and yet it is rarely eaten or fit to eat. Yet it is a capital dish, and most easy to prepare. I should like to see it twice or three times a week on every poor man's table. I have a predilection for Rice, having eaten of it three times daily, I believe, for some eight or nine months. It is a noble grain, but cruelly murdered by English, Irish, and Scottish cooks, and would-be instructors of the poor in its use. I shall give, in half a minute, a receipt for a Rice and curry, which I am sure would be equally relished by Prince Albert or Prince Albert's hind. Provided always, Prince Albert and his hind were hungry, and provided also the Rice, and other materials, were sweet, clean, duly prepared, in clean vessels, free from smoke, and promptly served up. *Imprimis.* Good, clean Rice, whatever may prove sufficient, is to be boiled for half an hour, no more and no less, in boiling water. The water is poured off, and the Rice is transferred into a dish. The curry is now poured over it, or the two can be helped separately. The curry is made thus. Take of fowl, or flesh, or fish, cut in small pieces, what may prove sufficient; season with salt and red pepper to taste. If the meat be lean, add a little butter. If it be dry, add a little water or any kind of "*jus.*" Stew in an iron, copper, brass, silver, or earthen vessel, closely covered up, as many hours as you please, with a very gentle heat. It is supposed in England that nobody out of Ireland knows how to boil Potatoes. This is a mere notion. It requires a little attention no doubt. People in England boil Potatoes perfectly well, but then the Irish eat them hot and hot. Unless this be done, the Potato deteriorates. And as people in England do not eat them the moment they are boiled, they fancy they do not know how to cook a Potato. It is how to eat them they do not know! It is quite a picture to see an Irish woman, poor dear soul, cook a pot of Potatoes. She looks curiously at them, and once the water begins to boil, keeps it boiling. She knows, she does, by a sort of intuition, when the Potatoes are about done. But to make sure, she picks one out of the boiling water, with her naked fingers as likely as not, clasps it in her hands, perhaps aided by the pressure of her knees.

If the Potato crush readily, it is enough. With lightning speed, she flings a cloth of some kind over the lid of the pot, which is left a little open, securing the ends with her thumbs. The pot itself is clasped on each side, though she never heard of Bontigny, with the naked hands. The water is quickly poured off, and the pot as quickly replaced upon the fire. After a brief pause, during which the family who are to share the meal are summoned, the Potatoes are rolled into a shallow basket, and after being daintily peeled, are eaten in the fulness of their first warmth and flavour. I may observe that Potatoes boiled this way are capital to eat with curry, but Patrick's wife knows nothing of the simple confection of a curry, though the poor Hindoo could teach her. Various meats are wasted by awkward modes of cooking. And I have seen excellent fish given to swine or left to rot upon the strand, fish that with a very little pepper and butter would have made a glorious stew or curry, for perhaps a week. Of all our working men, sailors, men-of-war's men in particular, are best fed. Soldiers are not nearly so well provided for. The allowance of meat, fresh or salt, 1 lb. per man daily, might, however, with much propriety, be diminished, and 1 lb. of salt or stack fish, during one or even two days, in the week, substituted. This excellent fare, however, is the result of intelligent, liberal supervision. Gladly, gladly would I see all our working men fed as well as the mariners on board our ships of war are fed. Our working classes, however, will never be fed properly till they shall be better educated, and therewithal learned to be more provident, and also more temperate. Even among the middle classes the mode of cooking is often insanely absurd and extravagant. I certainly did not contemplate passing these few and imperfect remarks on the *rationale* of food-preparing, had I not been prompted to do so by the exceedingly superficial and confident directions which were thrust forward by persons who, however zealous, had certainly never taken the slightest pains to obtain even the most elementary information on the subject. *Henry M'Cormac, M.D.*

Societies.

Linnean, *March* 7.—The President in the chair. C. Darwin, Esq., and S. Anderson, Esq., were elected Fellows. N. B. Ward, Esq., exhibited specimens of Thuretia quercifolia, Hemitrema elegans, and Claudea elegans, together with two new species of reticulated Algæ discovered in November, 1853, in Belligam Bay, Ceylon, by Dr. Harvey. Of the latter, one was a new species of Claudea (C. multifida, Harv.) ; the other a new genus most worthily dedicated by Dr. Harvey to the well-known natural history publisher under the name of Vanvoorstia spectabilis. Mr. Ward also exhibited a specimen of a new British Alga, Desmarestia pinnatinervia, Montagne, discovered by Mr. Sawers at Loch Foyle, about 20 miles below Londonderry, Ireland; and two species of Trichomanes lately discovered in Alabama, United States, by T. M. Peters, Esq., the one identical with T. radicans, the other a new muscoid species, dedicated to the discoverer under the name of T. Petersi, by Dr. Asa Gray, who has recorded the discovery, and given characters of the new species in the "American Journal of Science and Art," (vol. xv. 2nd ser. 1853). Mr. Layard laid before the meeting a list of numerous woods of Ceylon, and made some observations on their value and uses in building and other constructive arts. Mr. Adam White exhibited a portion of the Coleopterous insects collected in the Himalayas by Dr. Hooker, as well as others from the collection of Mr. Turner, of Manchester, and offered to the meeting some observations respecting them. Other insects, collected in northern China by Mr. Fortune, and in Natal by Mr. Guenzius, were exhibited by Mr. S. Stevens. This business occupying the whole time of the meeting, no papers could be read.

Entomological, *March* 6. — The President in the chair. The President announced that the annual excursions of the Society would take place on June 10, to Pembry *viâ* Tunbridge, and on July 8 to Mickleham. Mr. Curtis exhibited various interesting larvæ of different Coleopterous insects, namely, one supposed to be that of an Ophonus, and others supposed to be those of Stenolophus vaporariorum, those of Cistela atra, Prostomis mandibularis, Helophorus sp., and also of one of the Pyralidæ, which is very destructive on the continent in boxes of insects, spinning its web over, and devouring the specimens. He likewise, in allusion to the remarkable varieties of Fritillary butterflies exhibited at the last meeting, observed that the neighbourhood of Ipswich and Colchester seemed peculiar for producing such varieties, of which he mentioned some additional examples. Mr. S. Stevens had also obtained a curious variety of Limenitis sibilla, from the neighbourhood of Colchester. He also exhibited specimens of Anthrocera minos, a new Burnet moth, taken in Galway by Mr. Milner, and a fine series of Lepidoptera, sent from China by Mr. Fortune, and from Port Natal by Mr. Guenzius ; also a splendid specimen of Morpho Cypris, which he had restored to its pristine brilliancy (having been previously saturated with grease) by immersing it for three days in camphine, and then powdering it over with magnesia. Mr. F. Moore exhibited the cells of a mason bee or wasp from India, in which one of the beautiful parasitic Chrysidæ has been found, as well as the pupa of a wasp, the parent of which had probably taken possession of the previously formed cells for the deposition of her own eggs. Mr. Desvignes exhibited a fine variety of Melitæa Dictynna, and Mr. Foxcroft a quantity of whalebone shavings, infested by the cased larvæ of one of the Tineidæ, probably Tinea pellionella ; also specimens of the larvæ and perfect beetle of Boletophagus crenatus, a species first found by himself in Perthshire. The larvæ feed upon a Boletus growing on Beech trees.—A note was read from J. C. Dale, Esq., announcing the capture of Hemerobius dipterus, a species new to this country, at Langport, in Dorsetshire. A communication from Sir W. Jardine was read, requesting notices for the forthcoming volume on Zoological Bibliography commenced by the late Mr. Strickland ; also a note from Mr. W. H. Rawnsley, of Moreton Bay, New Holland, offering to collect objects of natural history on reasonable terms. A notice was also read of Dr. Reinhardt's intended voyage to Brazil for natural history researches, and to collect insects, &c. A translation by Dr. Wallich of a paper by the latter gentleman on a luminous larva observed at Lagoa Santa was communicated by Mr. Spence. The larva emitted a greenish light from two patches on the dorsal surface of each segment of the body, whilst the head glowed with a red light like burning coal ; it was supposed to be allied to the glow-worm. A notice was also read on the introduction of the Indian silk moth to Malta by Sir W. Reid ; and a paper by Mr. Newport on the priority of discovery by himself of the larva of Monodontomerus nitidus.

Notices of Books.

A Visit to Belgrade (Chapman's Reading for Travellers) is a very slight sketch of Servian manners. It may serve to occupy an idle hour, but is of no further moment. Carlyle's article on *Burns*, another number of the same series, reprinted from the "Edinburgh Review," is, like all the author's writings, original and instructive, though exaggerated.

Lance's Considerations upon Life and Marine Assurance (Longmans) are full of interesting details. It is estimated that the amount of Life Assurances has now reached nearly 210 millions, although the system is not a century old ; that about seven millions and a half are contributed to them annually by the public, of which about five millions are paid back on account of deaths. The annual income from marine insurances is laid at about five millions. But for this and other facts we must refer to the work itself, which is drawn up with ability.

Of *Johnson's Chemistry of Common Life* (Blackwoods), No. II. refers to the "Soil we Cultivate and the Plant we Rear;" No. III. to the "Bread we Eat and the Beef we Cook." The last is similar in purpose to the work by M. Payen, lately noticed in these columns.

Mr. Macaulay's Critical and Historical Essays are now appearing in well printed shilling numbers, each consisting of 128 pages in double columns. The publishers are Messrs. Longmans.

The Colonist's and Emigrant's Handbook of Mechanical Arts — by R. S. Burn. 8vo. Blackwood — is a well written, well arranged, and well illustrated treatise, showing emigrants, who must do their work themselves, if it is to be done at all, how they best can build, join, and furnish their houses, make their roads, fence their lands, and sink their wells. It goes into as much detail as 130 pages can contain, and will, we doubt not, be a welcome guide in every new colony.

New Plants.

50. Psammisia penduliflora *Decaisne; alias* Thibaudia penduliflora *De Candolle.*

The genus Psammisia has been formed out of Thibaudia ; it consists of branching shrubs, with coriaceous leaves, each having from 3 to 7 nervures, and bearing in their axil clusters of flowers furnished with very small bracts; in Thibaudia, on the contrary, the leaves have pinnated netted veins, and the peduncles bear large coloured bracts.

The present plant forms a little bush, a yard or so high, with a thin brownish bark. The young wood is smooth and cylindrical, tinted with violet on the sunny side. The leaves are oval, heart-shaped, with long points, 3-5-nerved, bright green above, paler, and marked with little black glandular points beneath. The flowers have a fleshy 5-toothed calyx, changing from green to reddish brown. The corolla is fleshy, cylindrical, distended at the base, vermilion red in the lower half, yellowish green in the upper. Found on the mountains of Venezuela, at the elevation of 5500 feet, by Mr. Linden. Requires the same cultivation as Thibaudias.—*Decaisne in the Rev. Hort. ser.* 4, III., 5, *with a plate; much abridged.* This appears to be a very handsome greenhouse shrub, with good foliage, and most brilliant flowers.

Garden Memoranda.

S. Rucker's, Esq., West Hill, Wandsworth.—It may be interesting to know that the magnificent collection of Orchids, for which this establishment is so justly celebrated, is at present in as fine condition as ever we remember to have seen it. It is true there have been times when we have found in it more plants in flower ; but as regards luxuriance of growth or deep green healthy colour, they never have been better. Foremost among such as are in bloom must be mentioned a glorious example of the still somewhat scarce Cymbidium eburneum, bearing 13 flower-spikes, each furnished with two large ivory-white blossoms, and all in the greatest possible perfection. This is of itself a specimen worth travelling miles to see. Phalænopsis amabilis is also now, as it nearly always is, finely in flower, as are likewise Vanda tricolor and one or two Dendrobes, &c. Vanda Lowi has grown well here ; but, as yet, it has shown no symptoms of flowering. In a small stove we found one side almost wholly filled with Cattleyas, which, having pushed freely last year, and ripened their growths well, may be expected to blossom in great perfection this season. They have all been fresh potted in Exeter peat, mixed with chopped moss, and have been wintered on the cool and dry system. In the "stove aquarium" were some thriving Nepenthes, which, having lately received a shift, were beginning to grow vigorously, and produce pitchers in profusion. In the same house was a specimen of Cypripedium caudatum, with 6 flower spikes, each bearing 4 flower-buds, which, if all expand well, must have a striking effect. Cypripedium Lowi had only one flower bud on it. Of Dendrobiums, what was called a pendulous variety of D. nobile was finely in flower, and some others hung up in baskets above the water were covered with bloom buds. Vanda Batemanni had shot up, in the moist heat of this house, to a height of 5 feet, and Dendrobium anosmum had made shoots of great length and thickness. In the tank were various kinds of Nymphæas ; on the back wall Ficus barbata (sticking to the wall like Ivy), the Vanilla, and other plants ; and scattered about the shelves were numerous Ferns, whose varied and interesting fronds contrasted well with the other forms of vegetation with which they were associated. In the warm division of the show house (for it is divided into two compartments by a central transept or wide span-roofed passage, at one end of which is an aviary), was an example of Lycaste Skinneri, which was stated to have had 40 flowers on it ; but several have been cut off for bouquets. When we mention that this is one of the largest-flowered varieties of the species, some idea may be gleaned of the kind of display it produced. In this compartment the plants in the centre bed are plunged in tan, a kind of treatment which appeared to agree with them, for all of them were unusually fresh and healthy. On the rafters Clerodendron splendens was in bloom ; this was what is called Henderson's variety, which is said to be a freer flowerer than the common sort. The cooler compartment was gay with Rhododendrons, Camellias, Azaleas, Acacias, Pelargoniums, Roses, Tree Carnations, Narcissi, and Early Tulips. Of the Azaleas, coronata is found to be one of the best for forcing ; Statices, such as arborea and macrophylla, are also favourites for winter decoration, as are Deutzia gracilis, Habrothamnus elegans, and Pelargonium Parson's Perpetual, a high coloured kind, which stands forcing well. On the north side of the lawn has been erected a glass covered promenade, which offers an agreeable retreat on a wet day. It is some 70 feet in length, 8 feet wide, and about 10 feet high ; a stone path passes along its whole length, and on either side are 2-foot borders, which are kept constantly gay with flowering plants, such as Camellias, &c., with a few Conifers and shrubs, remarkable for the beauty of their foliage. Out of doors everything is remarkably trim and neat. The fruit tree department has been remodelled and planted with pyramidal trees with bush fruit between them. A stock of miniature hardy fruit trees, such as Peaches and Nectarines, Apricots, Cherries, Plums, Figs, &c., is kept in pots for fruiting under glass ; they are found to require little care, to be easily accommodated as regards house room, and to produce good crops.

FLORICULTURE.

Chinese Primulas.—As nothing in their way could possibly be finer than my specimens of these at the present time, I have thought that some account of my mode of cultivating them might be useful. The single white and pink varieties ripen seeds in abundance, which afford a ready means of increasing them ; and as the fringed sorts are the most beautiful, seeds of them should be preferred. The double varieties are multiplied from cuttings. The best plants are raised from seeds sown every year ; they should never be kept beyond the second season. Two sowings, one this month the other in May, will supply the greenhouse with flowering plants from October till May, and even later. The produce of the first sowing must be prevented from flowering till the end of September, by nipping off the flower-buds as they appear. They should then (September) be well established in their pots, and they will require no care beyond ordinary attention, and keeping them from frost, to flower them well. The second sowing, the produce of which is intended to keep up gaiety in spring, should receive the final shift in September, and every blossom, as it appears, should be picked off till the beginning of January. I have said nothing about watering and shifting, but these operations must, of course, be attended to. The plants should be placed a little deeper in the pots at every shift ; care must be taken to keep them from damping off in winter. As a preventive of this, feeders under the pots are recommended to be used, for the plants are very impatient of water administered to the soil. These feeders should be liberally supplied with water when the plants are in bloom. The Chinese Primrose, like the rest of its race, delights in soil composed of leaf-mould, loam, peat, sand, and a little charcoal. The above is a mode by which these may be grown successfully in pots ; but they may be cultivated with equal facility, and better chances of success, planted out in summer in pits. As in the former mode of culture, sow at the same time, and forward the plants in pots in the greenhouse till the end of May, when they should be turned out of their pots, and planted in prepared compost in a frame under a north wall. Keep them close for a few days after planting, then remove all covering, and leave them freely exposed to the weather, night and day, till the time comes about for lifting them and potting them, which should be about the middle of September. After they are potted, replace them in the same frame, and shade them for a day or two, to keep them from flagging.

In about a fortnight, remove them to the greenhouse, where they will bloom well throughout autumn. Seeds for specimens for spring-work should be sown about the middle of April, and treated as the autumn flowers, taking care to keep them free from frost and from damping off in winter. After they have done blooming, they may be planted out as before, and will flower well next autumn. I have seen plants not excited by fire-heat, or allowed to flower in the previous winter or spring, blossom well in the flower garden during summer; and, not over-luxuriant, but strong old plants, put out in a west aspect in September, on an elevated dry border, under the shade of neighbouring Laurel-boughs, have been known to survive the winter near London, and to put forth flowers with the Crocus, Polyanthus, and other fair harbingers of summer. They did not suffer so much from frost as from the cold winds of March, "while winter still lingers on the verge of spring." *B.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Now is the time to set about ascertaining whether or not there is a sufficient quantity of plants for the decoration of the conservatory during the summer and autumn. If this is attended to at once, very much may yet be done towards making good any deficiencies which may happen to be discovered; for it is not yet too late to provide multitudes of showy plants for blooming early in autumn. Young plants of Allamandas, Clerodendrons, Torenias, &c., and many other things, if encouraged with a brisk bottom-heat, and other favourable circumstances, will form nice sized specimens in a few months; and large masses of Statices, than which few plants are more useful, will under kind treatment, be obtained in a very short time. The old Cassia corymbosa is a useful plant, and should not be overlooked where better things are scarce, as it grows very rapidly, and produces a long succession of bright yellow flowers. Those also who possess the Balsamina Jerdoniæ should encourage it by every possible means to make wood, and propagate it as quickly and freely as possible, for it is just the plant that is wanted for autumn decoration. Then there are quantities of useful things which may be raised from seeds, as Thunbergias, Ipomœas, Cockscombs, Globe Amaranths, Balsams, Lobelias, &c., and cuttings of Fuchsias made of young wood will root in warm sand in little more than a week, and may be grown into nice sized specimens by July. The pretty dwarf variety of Heliotropium Voltaireanum, although too delicate for the flower garden, will be found very useful for blooming under glass where sweet scented flowers are in request. In fact, where the stock in hand is deficient, not a day should be lost in making every possible effort to provide considerably more than is likely to be wanted, so as to be prepared against any accident or extra demand, should such happen to occur. Push on Camellias that have fairly started their buds with a warm moist atmosphere, and plenty of weak manure-water. Also get a portion of the Epacrises into a gentle heat as soon as they have sufficiently recruited their energies after flowering. These are exceedingly useful plants for winter flowering; and by starting them into growth about this time, and getting their wood ripened early, they will be in full blossom in November, at which season their flowers retain their beauty much longer than after the sun becomes powerful in spring. Proceed as diligently as possible with the repotting of such of the hard-wooded greenhouse plants as require it, so as to afford them every chance to make a vigorous growth. Be careful, however, before potting to have the ball in a nice, moist state, and avoid giving large shifts to weakly growers. Endeavour to keep newly-potted specimens together as much as possible, keeping the house rather closer, and the atmosphere moister than usual. See that soft-wooded plants, as Pelargoniums, Cinerarias, &c., are allowed plenty of space, and that they are properly supplied with clear, weak, manure water, and kept perfectly clear of insects. Give air freely to these on every favourable opportunity, but do not allow cold, winds to blow over them, and disfigure their foliage.

FORCING DEPARTMENT.

PINERY.—Attend carefully to the bottom heat, particularly where this is produced by fermenting materials, as tan, &c., and see that it is not allowed to rise too high, which it is exceedingly apt to do during bright weather, especially if fresh materials have been recently added. It requires some practice and attention to keep the soil in a properly moist healthy state, but this must be attended to if success is to be ensured. Maintain a thoroughly moist atmosphere, but do not push young plants too rapidly until the days get longer, when there will be no danger of inducing weakly growth. Avoid allowing water to lodge in the hearts of plants showing fruit; also spare the flowers of those in bloom with the syringe. VINERIES.—See that the houses in which the Vines are not yet started are properly cleaned—the Vines painted with the usual composition of soft soap sulphur, &c., and everything put into good working order; also get the rods bent in time, so as to cause them to push their buds regularly. Attend to disbudding and stopping, &c., as may be necessary in the succession houses, and see that the inside borders are in a properly moist state, giving occasional manure water when necessary, and do not be afraid of giving too much of this to Vines fruiting in pots. Be careful of coal, and husband the sun's influence as much as possible, by shutting up early in the afternoon; for, depend upon it, there is no heat so congenial to vegetation as that derived from the sun's invigorating rays. Where plants are grown under Vines keep a sharp eye upon these for black thrips, and use every means to keep them clear of this pest, which, if once allowed to get upon the Vines, will spread with amazing rapidity, and will soon ruin the foliage. This is not only the most destructive, but the most difficult of insects to extirpate, and should therefore be kept under by every possible means. Frost is the only effectual means of destroying this troublesome pest, but tobacco smoke and a liberal use of the engine will keep it in check. Azaleas are exceedingly subject to it, and young plants of these can hardly be obtained from the nurseries clear of it, and should never be grown in Vineries. FIGS.—Attend to preserving a proper degree of moisture in the borders or pots, and guard against red spider by maintaining a moist healthy atmosphere and a liberal use of the syringe. It is not very usual to thin the crop of this fruit, but, in cases where the crop is very heavy, timely thinning may prevent this being done by natural means at a later period, and to too great an extent, and will also be of much service to the general health of the trees, and towards securing a good second crop. CHERRIES.—In the treatment of these aim at imitating nature during a very favourable spring as nearly as possible, until the fruit is stoned, when they may be pushed on by a warm moist atmosphere. Here, as elsewhere, insects will have to be contended with and must be eradicated immediately they are perceived. STRAWBERRIES. — Bring on succession plants very gradually, and afford those in bloom a rather dry atmosphere, with a free circulation of air, as they set their fruit badly in a moist close atmosphere. Plants swelling their fruit must be liberally supplied with clear, rather strong, manure-water, and if fine large fruit is expected thinning must be resorted to immediately the fruit is fairly set.

FLOWER GARDEN AND SHRUBBERIES.

Sweep and thoroughly clean lawns, and give them a double rolling with a heavy roller, to render the turf smooth and solid. This is sometimes put off until dry weather sets in, after which the roller makes comparatively little impression, whereas, if done at once, while the turf is in a wet spongy state, it will be greatly consolidated and improved for the season. If any alterations or planting still remain unfinished every available hand should be concentrated on this work, so as to get it completed as soon as possible. Planting done after this time will require much attention in watering, and this at the very busiest season of the year, especially if large plants are removed, and it is too common a practice to put off such work to the last. Look over the beds planted with bulbs, and where necessary stir the surface soil, so as to keep it open and friable, and also to give it a clean, neat, fresh appearance. If the stock of bedding out plants is still deficient, get in cuttings in the most favourable position without loss of time. See to the propagation of Dahlias and Hollyhocks; the latter are now so greatly improved by the efforts of the florist that they are almost superior to the Dahlia in their effect, and ought to be extensively planted in every garden. Cuttings slipped off the old plants with a heel, planted in very sandy soil, and afforded a gentle bottom-heat, keeping the leaves as cool as possible, will be found to root perhaps more freely at this than any other season. Get Calceolarias hardened off by removing them to a cold frame and exposing them freely to air, preparatory to planting them in turf pits to make room under glass for more tender things.

FLORISTS' FLOWERS.

Carnations and Picotees have suffered much this past winter; those that escaped should be potted forthwith. We know of nothing better to grow them in than two parts sound virgin loam, one part rotten horse manure, and one part sharp river sand; in this simple compost, with occasional doses of weak liquid manure during the growing season, we have seen them grown in first-rate style. Seedling Pansies in beds should be gone over carefully, the surface soil stirred, and a dressing of manure put on. We like flowers of this description to bloom in their best character on their first appearance. Too often it is the case, that seedling flowers are begrudged a little trouble of this kind, but it is bad policy. Place the sticks to Pinks, and if not previously top-dressed do so now. Where the amateur has the convenience, we would advise him to grow a few of these flowers in half-peck pots, three plants in each; they would, we are sure, give much gratification. Ranunculuses have not yet made their appearance; they must be watched, as they are apt to displace the soil about the crown of the plant, which is prejudicial.

HARDY FRUIT DEPARTMENT & KITCHEN GARDEN.

Plant out Cauliflowers that have been wintered under protection on a deep rich piece of soil. Where the ground will admit, it will be found a very good practice in transplanting these at this uncertain season to throw out shallow trenches, placing the removed soil on the north side, and placing the plants in the trenches, which will be thus sheltered from the north winds. Stir the soil among growing crops, as Lettuce, Spinach, &c., and prevent weeds from making their appearance anywhere. Forward Celery plants for a very early supply, by pricking out on a slight hotbed, and sow on the same for succession crops. Where it is intended to head down old trees for grafting, this should be done at once, and young stock should be grafted as speedily as circumstances will admit. Attend to providing for a regular and plentiful succession of Peas, Beans, &c., by sowing quantities proportionate to the demand at short intervals. See that those in the ground are not injured.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending March 16, 1854, as observed at the Horticultural Gardens.

Satur. 25	50.4	32.7	41.6	11	0.50								

The highest temperature during the above period occurred on the 19th and 20th, 1836—therm. 69 deg.; and the lowest on the 25th, 1850—therm. 14 deg.

Notices to Correspondents.

BEES: *A F T.* If you are troubled with slugs in your hive it is because it is in too damp a situation and condition; you must, therefore endeavour to improve it in these respects. You may easily discover if there are any now in it, by turning it up and examining it.‡

BOOKS: *A Young Gardener.* Phillips's "Guide to Geology," mentioned at p. 54: Orr's "Circle of the Sciences." Lindley's "Theory of Horticulture" is out of print. A new edition is in preparation. —*J Mc M.* You do not state what kind of Vine culture your gardener wishes to be instructed in, and therefore we have no means of judging what particular book will suit him best. If, however, he wishes to grow Grapes in pots, Sandars on that subject will be most useful to him; if in a Vinery, Roberts, with the exception of what he says about carrion, which should not be used; and if on open walls, Hoare.‡—*Quercus.* We recommend the 2d edition of Brown's "Forester" as the best work we have upon planting.

CANVAS: *J D.* Tan it; but if kept in a dry ventilated place, and put by only when quite dry, it requires no preparation.

CLOCHES: *G G.* The remarks are a piece of impertinence. Had the writer taken the trouble to read, or if that were too fatiguing, to think, he would have seen that we neither forgot nor were ignorant of the wonderful fact that bell-glasses were formerly as much in use here as cloches in France. We wished to revive their use, which was stopped by the Excise on glass, now happily repealed.

COLLODION: *A Lady.* It is made by dissolving gun cotton in ether. We venture to believe that there is not a regular medical practitioner in England who cannot prepare it. If applied properly, as it to any gash, it holds with great force.

EALING PARK: *E. p.* We regret to say that your information is correct. The plants are to be sold in consequence of the ill-health of Mrs. Lawrence.

GROTTO: *Anon.* The design is in the very worst Cockney style.

HEATING: *W.* We much regret our inability to understand the question. Flues are usually built with angles. Near what door is the proposed angle to be made? Perhaps you would be so good as send us a sketch. We should be very thankful for the section you mention.

HYBRID CABBAGE, &c.: *W M D.* It is firm hearted, has a slight tinge of purple on the tips of the leaves, and appears to be very hardy. The Variegated Greens are finely curled and very handsome, and will, doubtless, be found extremely useful for many purposes; but especially for that of garnishing.‡

LAWN GRASSES: *W. Smith.* Alopecurus pratensis, 1 lb.; Avena flavescens, ½ lb.; Sweet Vernal, ½ lb.; 7 or 8 lbs. of the various Fescues; Rye-Grass, 10 lbs.; Phleum pratense, 1½ lb.; Poa trivialis, 2 or 3 lbs.; Lotus corniculatus, ½ lb.; White Clover, 4 lbs.; Black Medick, 1 lb.; *per acre.*

NAMES OF FRUITS: *G A.* Nos. 1 and 2 appear to be the Courtpendu Gris.|—*S N.* The three Apples are good keepers, somewhat resembling the Sturmer Pippin; doubtless, good for kitchen use.‖

NAMES OF PLANTS. We have been so often obliged reluctantly to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Car.* Scilla bifolia—*F B.* Cornus Mascula —the Cornelian Cherry. St. Ignatius's Bean is produced by a Strychnos, and is very poisonous.—*A H.* Anemone patens, palmata and lutea, are wholly different plants. The last is an alias of A. ranunculoides.—*A D.* One of the best varieties of Dendrobium nobile.—*W P.* It appears to be Dendrobium transparens.—*A L.* Anthyllis onobrychoides.—*W K.* Your specimens appear to be dead fragments of some Equisetum. If so, the plants will die as soon as the drainage acts efficiently. They are not to be feared.—*E G.* Acacia alata.—*Flora.* Lasiopetalum solanaceum.

SPORTS: *D T.* M. Fabre obtained his first sport in 1838; his experiments have been continued till now; the tendency to form Wheat was immediate, and it has continued to change more or less till now. He lives at Agde near Cette; the title of his experiments is "Courte Introduction au Travail de M. Esprit Fabre sur la Métamorphose de deux Ægylops." It was published in the Transactions of the Agricultural Society of the Herault. We are obliged to make it a rule not to enter into private correspondence.

TEMPERATURE TABLES: *M J B.* In those for Chiswick, against the day of the month is placed the maximum temperature which occurs on that day, and also the minimum in the following night, together with the rain, if any, between 9 A.M. and 9 A.M. the following morning.‖

WINTER GARDENING: *W D.* You will find the information you seek at p. 792 of our Volume for 1843.‡

WOODS AND FORESTS: *Chester.* Perhaps you are not aware that Mr. Henry Drummond has given notice of his intention to move for further inquiry. That is all that can be desired, and it is not our wish to anticipate the result of his motion. The truth of certain statements, published in the Blue Books is denied; and in fairness to all parties, we must await the further examination of those statements. The case of the New Forest rests however upon the admissions of the deputy-surveyor himself and upon other indisputable facts, so that there can be no misapprehension respecting that part of the Crown property.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

PERUVIAN GUANO, the guaranteed import of Messrs. ANTONY GIBBS AND SONS, Lobos Island Guano, Superphosphate of Lime, and all Artificial Manures, Linseed and Rape Cakes, &c.—WM. INGLIS CARNE, 10, Mark Lane, London.

ARTIFICIAL MANURES, &c. — Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and despatch.
Gentlemen desirous of receiving instructions in Chemical Analysis and Assaying, will find ample facility and accommodation at the College.

PEAT MOSS CHARCOAL, AND OTHER MANURES.—The Undersigned are appointed sole Agents by the Peat Moss Charcoal Company, for the sale of this valuable fixer and distributor of ammoniacal matter.
Also on Sale, Peruvian Guano, Superphosphate of Lime, Gypsum, Nitrate of Soda, Bone-Dust, Sulphuric Acid, and all other Manures of known value.—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7l. per ton; Superphosphate of Lime, 7l.; Sulphuric Acid and Coprolites, 6l.
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

SUPERPHOSPHATE OF LIME MANUFACTURED BY MR. J. C. NESBIT'S IMPROVED STEAM MACHINE. The following is the analysis of an average sample.
"College of Chemistry, Agriculture, and General Science,
38 & 39, Lower Kennington Lane, London.
Analysis of Sample of Superphosphate of Lime from Mr. Jolliffe:

Moisture		13.97
Organic Matter, &c.		21.98
Silica		6.05
Phosphate of Lime		35.27
SOLUBLE	16.10	
INSOLUBLE	19.17	
Sulphate of Lime, &c....		22.73
		100.00
Nitrogen (equal to)		1.16
Ammonia		1.41

(Signed) J. C. NESBIT."

Delivered free at a Wharf or Railway Station in London at 6l. per ton.—Apply to E. Y. JOLLIFFE, 70, Mark Lane, or the Works, Lavender Dock Wharf, Rotherhithe.
Agents wanted in all the principal towns.

SEWAGE GUANO, 5l. 5s. per ton (bags included). Circulars and Testimonials forwarded on application.

DEODORIZING CHARCOAL, 1l. 10s. per ton (bags to be returned). Terms: Cash on delivery.
The Manchester Sewage Guano Company, 3, Watling Street, Shudehill, Manchester. E. RANSBOTTOM, Agent.
JOHN THOMPSON, Secretary.

THE BRITISH ECONOMICAL MANURE COMPANY supplies in any quantity the "Economical Manure," a complete and by far the cheapest substitute for Guano. 1½ to 1½ cwt. per acre of this powerful Manure, costing 15s. to 18s., is ample (more must not be used), and equals 3 cwt. of the best Peruvian Guano, thus saving at least 50 per cent., besides carriage, &c.
The agricultural world is respectfully urged to read the hundreds of Testimonials from all parts of England, Scotland, and Wales, France, Belgium, and Spain, to be convinced that this Manure warrants especial and immediate attention. They prove that it gave most wonderful results last year on every soil and crop, far surpassing the expectations of the purchasers, the dampness of this climate and the coldness of the soil peculiarly favouring its action on the vegetation.
No one reading the Company's pamphlet can doubt its being by far the cheapest of all manures. In fair comparative trials on every kind of soil and crop with guano, dung, and other long recognised fertilisers, it will be seen the "Economical" was superior; that it proved most valuable for fruit trees, shrubs, and garden purposes, and produced the most astonishing effects upon manure heaps, applied in solution, decomposing in 15 days all vegetable matter, peat included; and that it is a perfect deodoriser for liquid manure, besides enhancing its fertilising properties.
It is the result of many years' labour of an eminent Foreign Agriculturist, the Director of the Government Schools of Agriculture in his own country, and of high reputation as a chemist. It is patented, and is one of the most useful and greatest discoveries of the day.
Price 12s. per cwt., packages included, and delivered free on rail or wharf in London.
The Company's pamphlet containing the Testimonials, directions for use, and all particulars, also samples, to be had at the Offices, 10, Mark Lane, London, or sent on applying to
BENJAMIN COVENEY, Manager.
Good Agents wanted. An allowance to the Trade.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.
MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

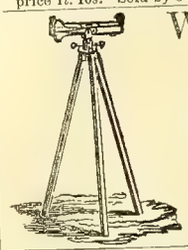
ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

PATENT ROOT GRATING MACHINE.

BUSHE & BARTER'S PATENT ROOT GRATING MACHINE, Manufactured and Sold by ALEX. SHANKS & SON, Arbroath, Forfarshire, from whom particulars, with prices, may be had.—Arbroath, March 18.

CHAFF-CUTTERS, of the best workmanship, 25s.; Two-Knifed Chaff Engines, from 63s.; Mills for Bruising Oats and Beans, from 45s.
WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

LAND DRAINAGE.
MR. BAILEY DENTON'S TABLES OF COST, &c., price 1s. 4d. Sold by METCHIM, Parliament Street.
MR. BAILEY DENTON'S WORKMAN'S A LEVEL, price 1l. 10s. Sold by JONES & Co., High Holborn, London.



WEIR'S DRAINING LEVEL
PRICE 30s.
These Draining Levels have lately been greatly improved; they have stood the test of five years' use, during which upwards of 1000 of them have been sold. They are so simple that any labourer who can read can use them. They require no graduated staff, the index telling at once the rise and fall in inches without any computation.
EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, (6 Doors West of the Hampstead Road), Removed from Oxford Street.

BY HER MAJESTY'S ROYAL LETTERS PATENT.
BAILY'S ROUP AND CONDITION PILLS FOR POULTRY.—This remedy has been extensively tried with uniform success, and is offered to amateurs and the public with the greatest confidence. It will effectually overcome that disease which has hitherto been the bane of the poultry-yard, and destroy that apprehension known to all poultry keepers, when a favourite and valuable fowl is seen to droop. It is inestimable for poultry returning from exhibitions, and greatly facilitates moulting.—Sold, with full instructions for use, in boxes containing 50 pills, by JOHN BAILY, 113, Mount Street, Grosvenor Square, price 3s. per box, or by post 3s. 4d. "Fowls, by Baily," the most useful and plainest treatise of the day; price 2s., by post 2s. 6d.
Baily's Registered Fountains, universally adopted and approved. Drawings and particulars, by post, on application.—113, Mount Street, Grosvenor Square.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

THE COTTAGER'S STOVE.—An economical, compact, and portable COOKING APPARATUS, combining a good sized Oven and Hotplate; may be had with or without a boiler, and will cook sufficient for a dozen persons with the consumption of 1 lb. of coal or coke per hour. It requires no fixing, may be placed in any apartment, and is a great security against accidents from fire. It will burn Coal, Coke, or Wood. They are also specially adapted for Emigrants, and may be seen in operation daily, at the Manufacturers', D. & E. BAILEY, 272, High Holborn, London.—Price 50s., and upwards.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.
From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

TO LANDOWNERS, SOLICITORS, ESTATE AGENTS, ETC.
THE LANDS IMPROVEMENT COMPANY, incorporated by special Act of Parliament, 1853, having perfected their organisation, are prepared to receive applications for the execution of improvements, under the provisions of their Act.
The Act extends to England, Wales, and Scotland; and empowers persons in the actual possession of lands, or in receipt of the rents, such as tenants for life, trustees, bodies corporate, incumbents of benefices, mortgagees in possession, guardians of infants, &c., to effect substantial improvements on their estates, and to convert the outlay on such improvements into a terminable annuity or rent-charge of from 14 to 25 years, at will.
The Company, acting under the supervision of the Inclosure Commissioners, will undertake and execute improvements, or will supply the capital to landowners preferring to execute improvements themselves, or will grant the powers of their Act to landowners seeking merely to charge the inheritance with the outlay on improvements from their own funds.
The Agricultural Works of Improvement particularly specified in the Company's Act, are:—
1. The Drainage of any Lands by any such means as the Inclosure Commissioners shall approve.
2. Irrigation, and Warping of Lands.
3. Embanking of Land from the Sea, or Tidal Waters, or Rivers, in a permanent manner.
4. Enclosing or Improving the Drains, Streams, or Watercourses of the Land, under the Inclosure Commissioners.
5. Reclamation of Land lying waste.
6. Making Farm-roads to the extent of one-half of the outlay for such roads.
7. Clearing Lands.
8. Erection of Farm-houses, and other Buildings required for farm purposes to the extent of three-fourths of the outlay for such Farm-houses and other Buildings.
In effecting the above Improvements there may be erected any Engines, Machinery, Engine-houses, Mills, Kilns, Sheds, Yards, Shafts, Tanks, and Reservoirs, Pipes, Conduits, and Water-courses for Irrigation, Tram-roads and other ways, Bridges, Weirs, Sluices, Flood-gates, and Hatches.
For Forms of Application and further Information apply to the Hon. W. NAPIER, Managing Director, 2, Old Palace Yard, Westminster, London.

SUTTON'S PERMANENT PASTURE.
GRASS SEEDS, SEPARATE OR MIXED.
GENTLEMEN *intending to lay down land to Permanent Pasture, or for one or two years' lay, are recommended to communicate with us, stating the nature of the soil and situation, that we may advise as to sorts of Grass Seeds most suitable.*
Price 24s. to 30s. per Acre.
Further particulars will be sent post free on application, addressed JOHN SUTTON & SONS, SEED GROWERS, Reading, Berks.

CLOVER SEED.
GENUINE NEW CLOVER SEED *may be obtained of the undersigned, at very moderate prices.*
Large quantities, carriage free, to all parts.
JOHN SUTTON & SONS, *Seed Growers, Reading, Berks.*

NEW AGRICULTURAL ROOT.
SUTTON'S CRUICKSFIELD HYBRID SWEDE.
This is very distinct from the Swede and the Kohl Rabi, but partakes of the nature of each of those valuable roots, from which indeed it has proceeded. It is of the shape and size of Skirving's Swede, but is much hardier, and has the flesh of the Kohl Rabi. Cattle, and especially Sheep, eat it with great avidity, preferring it to Swedes, when both are presented to them.
Particulars of Culture, &c., will be sent post free on receipt of one penny stamp.
Address, JOHN SUTTON & SONS, Seed Growers, Reading, Berks.
N.B. We have an excellent Stock of Swede and other Turnip Seeds, Mangold Wurzel, and White Belgian Carrot Seed, &c.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &c.
Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Geology, Zoology, and Botany—James Buckman, F.G.S., F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.
Assistant to Chemical Professor—A. Williams, M.R.C.S.
Students are admitted after the Summer and Winter Vacations, also in April and October. The annual fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40l. per annum. The College Course of Lectures and Practical Instruction is complete in one twelve-month—though a longer course is recommended. There is a department for general as well as for agricultural purposes.
Prospectuses and information can be had on application to the Principal.
The GUIDE TO THE ROYAL AGRICULTURAL COLLEGE FARM may be obtained of HAMILTON, ADAMS, & Co., Paternoster Row, London; and EDWIN BAILY, Cirencester. Price 1s.

ROYAL PANOPTICON OF SCIENCE AND ART, Leicester Square. Notice is hereby given, that the preliminary opening of this Institution on SATURDAY next will be extended during the whole of the following week. Hours of Admission from 11 to 4, and from 7 to 10.

INSTRUCTION IN ART to FEMALE STUDENTS afforded by the DEPARTMENT of SCIENCE and ART.
The Spring Session commenced on the 1st of March, and will terminate on the 31st of July.
The School for the Female Students passing through the General Course is at No. 37, Gower Street, Bedford Square. Superintendent, Mrs. M'Ian; Assistants, Miss Gann and Miss West.
Fees:—Advanced Classes, 2l. and 4l.; Elementary Class, 20s.; Evening Class, 10s.
A Class meets at Gore House, Kensington, on Mondays, Wednesdays, and Fridays.
TECHNICAL COURSES, carried on at Marlborough House.
Porcelain Painting, daily Teaching and Practice, with Studies from the Living Draped Model. Fee 4l. Superintendents, Mr. Simpson and Mr. Hudson.
Engraving on Wood and Metal for Ornamental Purposes, daily Teaching and Practice, and Lectures. Fee 2l. Superintendents, Mr. Thompson and Miss Waterhouse.
Lithographic, Chalk, Pen, and Colour, daily Teaching and Practice. Fee 4l. Superintendents, Mr. Brooks and Miss Channon.
Marlborough House, Pall Mall.

POULTRY SHOW AT EXETER.
OPEN TO ALL ENGLAND.
THE DEVON AND EXETER BOTANICAL AND HORTICULTURAL SOCIETY will hold a GRAND POULTRY SHOW, on Northernbay, Exeter, in conjunction with the Society's Spring Horticultural Exhibition, on THURSDAY and FRIDAY, the 18th and 19th days of May next.
Prize Lists and Regulations may be obtained on application to the Honorary Secretary, THOMAS WILLIAM GRAY, Esq., Cathedral Yard, Exeter.

The Agricultural Gazette.
SATURDAY, MARCH 18, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS
WEDNESDAY, March 22—Agricultural Society of England.
THURSDAY, — 23—Agricultural Imp. Society of Ireland.
WEDNESDAY, — 29—Agricultural Society of England.
THURSDAY, — 30—Agricultural Imp. Society of Ireland.

THE last four weeks have seen more field work done than was probably ever done before so early in the season; that great advantage has been taken of so favourable a time for the benefit of fallow crops is unquestionable, but it yet remains to be seen whether the early seed time, to which many have been tempted, will be for the benefit of the farmer. Certainly, as land gets more and more improved under drainage and good cultivation, operations are earlier performed with safety than they used to be; but if an April like that of 1853 were to follow the present month, it would spoil the work of many a sanguine, over-active farmer.

Oats have been sown with safety; Barley it will generally be thought better to delay till towards the end of the month. Grass and Clover seeds may be sown, but they, too, had now better be delayed till the first showers shall have moistened the land. Potatoes may be planted now, and this probably may be considered the most suitable operation for this fine weather. Land should be prepared for Carrots to be sown the first week in April. Vetches, for consumption after midsummer, may be sown now. Peas may have been sown. Flax seed may be sown late in March, or early in April. And as to other operations, fallows for Mangold Wurzel may receive

a cross ploughing, and Grass lands should be cleaned and rolled. Young Wheats may be rolled previously to the hoeing which they will receive in April. Guano, and other half-soluble hand manures, may be scattered broadcast over either Wheat or Grass on which they are to be applied. The more soluble nitrates, &c., should not be used till the period of more active vegetable growth.

"Whereas it is expedient that the power to remove poor persons on the ground of SETTLEMENT should be annulled" are words which we rejoice to say are likely ere long to find a place in a legislative enactment. That the most crying of the evils attendant upon the past and present system of our Poor-laws is the power which prohibits free trade in labour, which deprives the able-bodied pauper of the means of carrying his labour to the place in which it is wanted, and which forces him to offer it, whether wanted or not, in the parish in which he is "settled," has been long the opinion of reflecting men, and seems to be now universally admitted. The proposal of the Government to annul this power will be hailed with delight by all who are interested in the internal welfare of this country.

Second, however, in injustice only to the power of compulsory removal of the poor, is the mode in which the funds necessary for their support are raised. Under the present system of parochial assessment, the burdens imposed upon adjoining parishes are often unequal in the extreme; and the opportunity afforded by the abolition of the power of removal for placing the whole system of Poor-laws on a better footing should surely not pass without an attempt being made to remedy the great defect above alluded to. The framers of the Government measure about to be brought before Parliament seem to have entertained the same opinion, for in their bill they propose that the charge for the relief of all poor persons in an *Union* shall be borne by the common fund of that Union. As regards the raising of funds for the relief of the poor, the two great objects to be attained seem to be, first, to make the burdens fall as equally as possible all over the country; and, second, to render the distribution of the funds a matter of local importance, in order to prevent indiscriminate relief, and wasteful expenditure. The first of these two objects is best attained by extending the area of country from which the common fund is raised, but unfortunately the more this area is extended, the less is the application of that fund likely to receive proper attention. The maximum of evil will naturally ensue where the area is too small to equalise the burdens, and yet too large to interest any individuals in particular in the expenditure of the money raised.

How far the proposed bill, should it pass into law in its present form, will equalise poor rates, and prevent wasteful expenditure, we of course presume not to say, but we cannot refrain from drawing the attention of our readers to a very able pamphlet* on this subject by Mr. Pashley, than whom no one is more familiar with the whole system of Poor-law, or more competent to pronounce a trustworthy opinion upon any matters relating to it. He observes that a divisional rating, similar to that now proposed, was tried as early as the reign of Elizabeth, and was found not to answer; that, in many parishes, the burden would not only be excessively increased, but be much heavier than the average burden of the whole country. Of course the value of the land in such parishes could not be otherwise than greatly affected. As regards the attention likely to be paid to the distribution of the funds, the learned author states:—

"Another and an extremely grave objection to merging the parish in the Union, as proposed by the bill, is, that the doing so would on the average reduce the interest of each guardian in examining into any case of alleged destitution in his own parish, to the twenty-third of its present amount; for there are, on the average, 23 parishes in every Union. After such a change the guardian would not attend to the Union interests, as he now does to those of his own parish. It is well-known that the establishment or Union charges at present existing are not the object of the same vigilant and jealous care with which every parochial burden is regarded."

Whether these opinions are or not well founded, they certainly deserve great attention, coming as they do from so high a quarter. That the Poor-laws should be wholly revised is doubted by no one; but prior to their revision, care should most undoubtedly be taken not to introduce evils greater than those abolished. Upon a former occasion (see the *Gardeners' Chronicle* for 1852, p. 749), the attention of our readers was directed to a plan proposed by Mr. Pashley himself for the assessment and distribution of the poor-rates, a plan which if adopted would seem to require fewer changes in the actually existing machinery, and to combine equality of burdens and vigilance over expenditure to a greater extent than any other scheme which has been brought forward. By this plan two-thirds of the whole amount of poor-rates for the entire country would be raised by an equal rate over the whole country, whilst the remaining one-third would be raised by rates levied on parishes as at present, and proportioned to their several necessities. In the words of the pamphlet above alluded to—

"My proposal is, that, on the repeal of the law of settlement, the various provisions for raising and administering relief to the poor be consolidated into one statute; that the sum needed yearly for the relief of the poor be raised by parochial rates on *all* real property; that the amount in the pound levied in each parish should be at such a sum as to equal one-third of the parish rate needed to raise the relief bestowed in the parish, added to two-thirds of the average poor-rate of England and Wales. According to this plan, two-thirds of the sum expended yearly in relieving the poor, though raised parochially, would be raised equally throughout the whole country, and the remaining third of the expenditure of the whole country would be raised by each parish contributing one-third of its own actual expenditure."

For an explanation of the mode in which this proposal would have to be carried out, reference must be had to the author's essay on "Pauperism and the Poor-laws," and his recent pamphlet, both of which are deserving of most careful consideration from those who have it in their power to assist or check the carrying out of the scheme about to be brought forward for the sanction of the Legislature.

* Observations on the Government Bill for Abolishing the Removal of the Poor. By Robert Pashley, one of her Majesty's Counsel. Second edition. Longman, 1854.

ON THE GRAIN STATISTICS OF FRANCE,

And more especially on those of Wheat, from 1815 to 1851.
By M. Becquerel (Comptes Rendus, Nov. 1853).

The statistics of cereals is, in a general point of view, an assemblage of documents which gives us information on the production and price of grain, the quantities necessary for sowing and for home consumption, the quantities imported and exported, as well as on the causes which exercise an influence on culture and production. But these statistics are not confined to the mere registration of the necessary documents; the value of the latter must be ascertained, and laws or principles deduced by which questions of the highest national importance relating to cereals may be answered. Statistics do not, however, inspire confidence, unless the elements composing them be perfectly exact; the results deduced can then possess all the requisite mathematical accuracy; but such is not always the case. It is frequently necessary to make use of documents more or less doubtful in their nature. This applies more especially to agricultural statistics.

We are indebted to the Government, says M. de Gasparin, for a valuable series of statistical researches elaborated by the perseverance of M. Moreau de Jonnès; these researches doubtless contain many errors resulting from imperfect means of investigation; but considering them as a whole they approximate the truth, and form the most exact basis on which we can work, until statistical science shall have perfected the means of collecting data." (Recherches sur les Subsistances, p. 3.)

The first documents collected on the production of grain, and on the population with respect to the annual consumption, date from the year 1815. At that period a series of questions was sent to the prefects; their replies served to compose the statistical archives of the Minister of Agriculture and Commerce.

In 1836 the Minister, in a circular, dated June 12, ordered the prefects to prepare the materials for a fresh body of statistics, and prescribed the measures to be taken for arriving at the object in view with greater precision than had been hitherto done. The Minister, in discussing the means of collecting the agricultural statistics, adds that "Two very different methods might be employed: the first, easy and expeditious, consists in estimating everything in masses by the department; the other, long and complicated, proceeds by collecting the necessary data from even the most obscure localities; and by adding the results obtained from the different communes, those of the cantons, arrondissements, departments, regions, and finally of the whole kingdom, are obtained. The latter method having been considered as the only one which was rational, it has been resolved that it shall be employed in forming a register of each of the 37,300 communes of France."

Instructions were sent to the prefects and transmitted by them to all the sub-prefects and mayors; but, as might be expected, the execution of this vast project encountered many and great obstacles. To obviate difficulties arising from omissions and errors in figures, the prefects submitted the returns of the communes to commissions of revision, formed in cantons and arrondissements, and these again submitted the returns to a central commission at the chief town of the department. In this way many modifications and improvements were introduced. Such was the care used that the Minister declared that the proofs for verifying the results were a guarantee that no considerable error could exist in the agricultural statistics. They are comprised in four volumes, the first of which was published in 1840, and the last in 1842. It is, however, a matter of regret that the respective years from 1836 to 1840, to which period it applied, were not stated, for each year should be particularised, so that the progress of cultivation from year to year might be followed out.

In this statistical account France is divided into four regions, each composed of departments allied to each other in respect to geographical position, soil, and climate. The meridian of Paris, which divides France from north to south into two nearly equal parts, and the 47th parallel of latitude, which crosses it exactly at the centre of the country, were chosen as lines of demarcation. In the subsequent statistical extracts, the results of which have not yet been published, the ancient division of France into ten regions has been adopted for the statistical archives of the Minister of Agriculture and Commerce.

The annual average increase of the number of acres sown with Wheat from 1836 to 1851 is 117,725 acres. It has also been proved that the produce per acre has likewise increased—

	Bushels.
From 1835 to 1839 the average produce per acre was	13.877
„ 1840 to 1844 „ „ „	15.092
„ 1845 to 1849 „ „ „	15.373
„ 1850 to 1851 „ „ „	16.039

The analytical examination of the consumption of Wheat, whether for food or for seed and other uses, has led to the following results:—In the period from 1836 to 1851, after supplying all demands, and taking into account the increase of population, the crops have given a surplus of 9,912,795 quarters, being, on the average, an annual surplus of 660,852 quarters.

It is, however, to be remarked that from 1836 to 1846 there was a deficiency amounting to 17,785,761 quarters; but from 1846 to 1851 there is a surplus of 27,698,554 quarters; a result which is confirmed by the high prices from 1836 to 1847, and the low prices from 1848 to 1852.

Does there exist in a series of years periods of abundance and of scarcity? We must reply in the affirmative, if, with Count Hugo, we understand by a period of abundance that which is composed of years in which the exportations exceed the importations, and the price low; and by a period of scarcity, that in which the importations exceed the exportations, and the prices high. But we ought to reply in the negative, if we take into consideration the quantities of Wheat produced during these periods. According to Count Hugo, there have been seven periods from 1815 to 1852; three of abundance, three of scarcity, and one mixed, being partly abundant, partly scarce.

From 1816 to 1821—Period of Scarcity.

Importation	2,354,523 quarters.
Exportation	206,110 „
Average price, per quarter	55*s.* 7*d.*

From 1822 to 1827—Period of Abundance.

Importation	22,067 quarters.
Exportation	451,472 quarters.
Average price, per quarter	37*s.* 1½*d.*

From 1828 to 1832—Period of Scarcity.

Importation	3,614,100 quarters.
Exportation	33,758 „
Average price, per quarter	51*s.* 8½*d.*

From 1833 to 1837—Period of Abundance.

Importation	176,348 quarters.
Exportation	501,034 „
Average price, per quarter	37*s.* 11½*d.*

From 1838 to 1842—Mixed Period.

Importation	1,453,657 quarters.
Exportation	1,066,232 „
Average price, per quarter	47*s.* 8½*d.*

From 1843 to 1847—Period of Scarcity.

Importation	6,933,556 quarters.
Exportation	503,596 „
Average price, per quarter	36*s.* 10*d.*

From 1848 to 1852—Period of Abundance.

Importation	466,600 quarters.
Exportation	5,001,772 „
Average price, per quarter	39*s.* 2*d.*

The characters adopted by Count Hugo for specifying these different periods are incontestable; but on examining the figures of production in the respective periods, we find that the number of quarters harvested and distributed amongst the inhabitants have been nearly the same. The great amount of importations, and the high prices during the periods represented as those of scarcity are therefore not to be entirely attributed to a failure in produce, but rather to speculation, and the fear of scarcity, which induced individuals to store up the grain.

From 1815 to 1851 the importations have exceeded the exportations by 7,503,267 quarters, being on the average 197,210 quarters per annum; and as the crops since 1847 have yielded a surplus of 1,375,605 quarters, after supplying all wants, it may be asked, what has become of this surplus? Has it passed, in consequence of greater facility of communication, into the departments in which Wheat was not formerly used for food; or has it gone in another direction which the statistics have not taken into account? At all events, it is evident from the calculations that France since 1847 has produced a considerably greater quantity of Wheat than she requires.

In conclusion, it would be desirable that meteorological observatories were established throughout the country, in order that the results of observations might be studied with regard to the action of atmospheric influences on the crops.

Home Correspondence.

Meteorology.—I cannot agree with "F. P. B. M.'s" remarks on the rotary theory of storms, as I have been unable to trace a single storm which could be explained on such a supposition. It would be out of place to enter on a full discussion of this subject in the *Gazette*, but I would endeavour to meet one who holds views so oppo-

site to my own on this question, at the Liverpool meeting of the British Association in autumn, and discuss the whole matter. I would be quite willing to take the storm of January last for illustrating the fallacy of Mr. Redfield's views, or any other which "F. P. B. M." might select. I have been led to think that the very general assent which has been given to the rotatory theory in this country has done not a little to retard the progress of meteorology. *R.*

Stoppage of Drains.—My attention was first attracted to this subject 33 years since at Berry Pomeroy. The water that supplies the village is brought down in pipes from a hill about half a mile distant, in an easterly direction. These pipes frequently choke, and a force pump being used, the long hair-like filaments are driven out with violence, and the choking removed. On carefully examining in a large tub of water the mass thus extracted, I found it to consist of numerous filaments of great tenuity and of immense length, extending very many yards. There did not appear to be any rootlet, but as far as it was possible to trace the mode of growth, the filaments appeared to spring one from another in straight parallel lines, and it would seem to ascend against the stream. On subjecting the filaments to a powerful microscope it was discovered that they were copiously in bloom, although quite undiscoverable by the unassisted eye. The blossoms were white, of a pearly lustre, erect, but very minute. It so happens that Denbury, similarly situated on a dry limestone soil, is supplied with water by pipes from a neighbouring hill at nearly the same distance as at Berry Pomeroy. On making inquiries there, it was found that the water coming into the centre of the town falls into a tank or reservoir, which stores it for the use of the inhabitants. That the pipe conveying the water does not touch the surface of the stored water, and consequently the filamentous or thread-like weed does not ascend, and choke the pipes. Your correspondent, then, may take advantage of this circumstance to prevent the nuisance complained of; for if his drain pipes are clean and free, it will suffice to make a perpendicular fall of 1½ or 2 feet at the nozzle of the flow pipe, which will prevent the filaments from ascending and choking his drain pipes. *Pilos.*

Geology and Agriculture.—In these days, when agriculture is regarded as a scientific pursuit, and chemistry and engineering are held up to us as her crutches, we are apt to forget that there is another science to which the agriculturist is deeply indebted, namely, geology. It is not meant that the importance of geology is overlooked by scientific men; the able works of Professor Johnson, Mr. Morton, and others, prove that it is not from these that geology receives her slight, it is from the practical farmer; he speaks with due gratitude of the chemist, who has opened to him rich sources of fertility in new artificial manures, and has taught him how to make the most of those already at his command; he is not unthankful to the engineer, whose genius has lessened the cost of production by improvements in his implements, and by the removal, by means of drainage, of all surplus water; but he passes by the labours of the geologist, who points out to him the general characteristics and physical properties of his soil, directs him where and at what depth he may expect to find marl, lime, or other minerals, who by his maps indicates where he will find such a soil as will suit him, and by comparing districts of a like geological character, can tell him what plants are likely to succeed best in any given district. But these are advantages which the farmer is very apt to forget, probably because he does not avail himself of them to that extent which he might. Geology is a science, the study of which the agriculturist would find of great value to him, and yet one which he habitually neglects. *C. D. B.*

Measurement and Weight of Cattle.—It would, in my opinion, be of great importance to the feeders of stock generally, and more especially so to young farmers, were they to pay attention to the instructions laid down in Morton's "Cyclopædia" for estimating the value of stock by measurement. I have in several cases compared it with another plan of measurement in which I had hitherto placed great confidence, but have invariably found Ewart's to be the most accurate. I give two cases, though not such as to approach the dimensions of that beautiful animal referred to in a late number of the *Gazette*, yet they may be the means of inducing others to have recourse to this mode of ascertaining the value of stock before sending them to market. The dimensions of the first were—length, 5 feet 2 ins.; girth, 93 inches; then having taken the condition of the beast into account, the weight was equal to 73 stones 11 lbs.; the actual weight, the day after being killed, was 73 stones 4 lbs.; difference, 7 lbs. The second case was, length 5 feet 4 inches, girth 93 inches, equal to 76 stones 2 lbs.; actual weight was 76 stones; difference, 2 lbs. The age in both cases was "coming three years old." I could quote half-a-dozen more instances where the total difference between weighing and measuring did not exceed 14 lbs., but will only add that the person to whom the two beasts in question were sold, and in whose presence as well as in mine they were first measured and afterwards weighed, is Mr. Geo. Stephenson, butcher, Marketweighton, Yorkshire. *P. Deane.*

Harvest Returns.—I would suggest, in reference to the valuable statistics of the last harvest, published in No. 2 of the *Agricultural Gazette*, that the weight of the grain, especially of the Wheat, would be a valuable particular. With the weight of the grain, the quantity of flour directly varies; and if the grain of Wheat be this year quite as deficient in weight as the yield per acre, this may account for what is occasioning a good deal of comment and dissatisfaction, viz., the high price of bread at present relatively to the average price of Wheat, as compared with their relative prices in other years. On Jan. 7, for example, with the returned average of Wheat at 76*s.* 2*d.*, the price of the quartern loaf, as you report for London, and I find also in Essex, was 1*s.* and 1*s.* 0½*d.*; while, in May 1847, with the average price of Wheat at 105*s.*, we paid only 1*s.* 1*d.*, and, in some cases at the West End, 1*s.* 2*d.* per quartern. It is observable in the accounts of the late lamentable bread riots at Exeter, that the occasion of the outbreak is referred to a charge of 9*d.* for the quartern loaf, in relation to Wheat at 11*s.* a bushel, or 88*s.* a quarter, while here our peasants are peaceably paying 1*s.* for the loaf, in relation to Wheat at 10*s.* 6*d.* the bushel. *Brentwood.*

Fences.—I agree with Mr. May in most of the general rules he lays down for the management of young Thorn hedges, only, instead of cutting over a year after planting, I would delay till the end of the second, by which means a much stronger growth will be secured, and a sufficient fence sooner attained; and instead of cutting at 6 inches above the surface, I would prefer cutting as near the ground as possible. This obviates what sometimes happens when they are cut higher, that is, the shoots being broken off by the wind or other accidents; as a further security against this, I generally draw a little earth to the bottom of the stems after they have pushed a foot or two; indeed, it may be done with safety before they push at all. Old neglected hedges, if cut over, close to or a little below the surface, well cleaned, the empty spaces well dug up, manure well worked in, the wants made up with good healthy Beeches, and well attended to afterwards, will soon make as good fences as those raised from young Thorns, whereas, if cut at some height from the surface, they may grow for a time, but the old part left will soon decay—gaps will occur, and total death soon ensue. Mr. May's remarks refer of course to hedges planted on the surface, except in gardens, nurseries, or pleasure grounds; they are generally planted in this neighbourhood on the face of a bank, dug from a shallow ditch. *G. A., Kilmarnock.*

Soap.—On February 11, "C. S. C." again asks a receipt for making soap with snow. As no one has yet had the kindness to enlighten him on this very important subject, in the absence of more scientific communications, perhaps the following incident will give him as much information as he will care to obtain. In a tolerably old-fashioned winter, some 30 years ago, when a deep snow lay on the ground, it was current in the newspapers of Ireland, this manufacture of snow soap. A poor half-pay sub. of our Peninsular army, to whom economy in all household expenditure was more matter of life and death than half a dozen campaigns in Spain had been, and whose enthusiasm ever ran ahead, seized with delight the opportunity to convert 1 lb. of soap into 7. "Wife of my bosom!" says he, "send at once for half a stone of soap." "Stay," replies the little prudent woman, "let us try first the pound we have in the house." Down goes the pot, 7 lbs. of snow are soon gathered into it, and the pound of soap, cut into ribbons without the aid of Bushe's pulping machine, is added. The pot simmers, bubbles, boils, well stirred, and closely watched by my poor sub. and his wife; it thickens beautifully, and the viscid mass is quasi soap. "Oh," says Mrs. Prudence, "it will do," and, in great trepidation lest this provoking thaw should carry off the snow, she despatches instanter a poor shoeless drab to the next market town for the half stone of soap. It arrives just in time; a 4-stone pot is on the fire ready to receive it; all goes on well. The poor sub., who is something of a carpenter, sets to work and knocks up boxes to receive the emollient mass. They are filled, the soap firms, it is cut into bars, and put away on shelves in a dry room; it is as like any new soap as one Pea is like another. The sub. and his wife are delighted; a summer's supply of soap from only 7 lbs. So far, all well. Washing day comes. "Mistress, this is but weak soap; it makes very poor lather; the suds are no good." Oh, the prejudices of these poor ignorant creatures! Still in future washings the prejudices hold good. The summer comes; the soap is well dried, firm, and hard as any old soap; but, alas! it is also reduced to its original bulk and weight—the snow-water has all passed off in the slow process of evaporation. It is very possible that it is now too late this season to gather snow, and it may be too trying to "C. S. C.'s" patience to wait till next year; it may, however, be some comfort to him, the assurance that he has only to rest on his oars till the 1st of April, when he may collect 7 lbs. of rain-water to his pound of soap, and then participate with my poor sub. and his wife in their satisfaction, for his rain soap will be just as good as their snow soap. *J. M. Goodiff.*

Progress of Agriculture and Commerce.—In a manufactory every element of success is studied, economy of design is seen throughout, nothing is wasted that can possibly be converted to any use, and, by attention to innumerable minutiæ, manufacturers are enabled to realise a fair return for their capital, although the price of their produce is remarkably low, and the smallest possible margin even with the best management remains for profits. How is it that commerce has attained to its present gigantic position, while agriculture is still so behindhand? Desire an example of intelligence, vigilance in business and general enlightenment, and thousands offer in our manufacturing towns; not only among the masters, for in them you would naturally expect it from their position, education, &c., but in numbers of the artizans—in men who never had the opportunity while young of acquiring even the rudiments of those things with which they are now conversant. Why, nine-tenths of the mechanics in this country are as mentally superior to the smaller farmers as the improved Berkshire pig is physically to its long-eared, long-legged ancestor. When our glory and greatness are boasted of, it is with shame and sorrow that the condition of the agricultural population forces itself on my mind. Still it is interesting to consider the various circumstances which have led to the wide difference which exists between them and commercial men. In making this comparison, it is, I think, necessary to look backward to the feudal ages, for there we shall find the origin of the different paths they have since pursued. The towns sprang up in spite of, rather than owing to, the encouragement or protection of the great proprietors. At first, few and defenceless, they were glad to shelter themselves under the banners of the neighbouring chieftain; but as they increased through the spirit of commerce, they were not long in claiming the rights of freemen, and, by union and courage, rapidly acquired liberty, becoming a powerful body in the state, useful to the monarch in helping him keep the nobles in check, and replenishing his coffers in time of need. The towns thus forming themselves into corporate bodies acquired freedom in action, and the important quality of thinking and acting for themselves. Contrast with this the position of the cultivators of the soil. The serf or villein was an animal as completely a slave as any now in bondage in the southern states; he received a portion of land to cultivate, on condition of rendering an enormous tribute, and was tied to the soil as completely as the chained African; like the latter, his chattels and his life were at the mercy of his lord. The barons of England have passed away, the serfs they malgoverned exist only in the annals of history, but the marks of the feudal chain yet remain, and many of the laws and customs bearing upon real property are handed down unrepealed from those days, forming a fatal clog to every effort to place agriculture upon a footing with other manufactures. It is true they are not often taken advantage of, but when they are, great is the evil. One custom still remains, which, as it bears very appositely upon our remarks, may be mentioned. In cases where yearly agreements are the contracts for letting a farm, it is the law that a tenant desirous of leaving and giving his landlord notice, is unable to recover a farthing for all the improvements he may have made. Under such a system, what man with an uncertain tenure would be mad enough to risk more capital than he can help? Here and there we do find patches of well cultivated land with thriving farmers, good buildings, comfortable stock, &c.; and if inquiry is made, we shall generally find such land is occupied upon long leases. The landlord, a man of property and shrewdness, willing to lay out where he can insure a good rate of interest, and permanently improve his property. The tenant, a man of capital, with a good account at the bank, which is at all times preferable to a host of references; he knows that any expense he goes to with judgment will repay him during his long lease, and his landlord takes care by clauses and proper remuneration to prevent that exhaustion of the land towards its termination, which is too frequently practised. In order to ensure good tenants there must be good landlords, that is men possessed of capital who will invest freely when a good return is ensured. No tenant can be expected to farm well under a beggared landlord, on an estate deeply mortgaged, which, alas! is too often the case. For such diseases the remedies must be severe. The Encumbered Estates Act has worked most beneficially in Ireland—why not here? By this means the land would get into hands capable of developing its resources. With the moneyless landlords the under-capital farmers would disappear. Education having lent her valuable aid, we should at length see the land done justice to, and this country might at last be with reason proud of her agricultural classes. *C.*

Agricultural Labourers.—It has been the professed object of philanthropists and political economists, from time to time, to ascertain the cause, and if possible to find a remedy, for the degraded state of the agricultural labourer. Benefit societies, parish and county clubs, clothing societies, and every possible form that benevolence could conceive, have been tried; while some have gone so far as to coerce the labourer to the course of life that was deemed for his benefit: and too often has this last remedy been tried, and, we need not say, without success; for a man, as a man, must be very far sunk, and have but a poor idea of his standing in the social scale, to be the better for this. Benefit societies may in an enlightened community be of great service; but hitherto they have rather been a curse, leading to a sort of drunken, riotous holiday once or twice, and at last, by their management, driving the best of their members from them in disgust, and then the result is soon plain—the society is broken up, and in such a state that the dividend is small, indeed, that can be paid to the poor man who has paid into it. Again, parish and county clubs have been conducted on an entirely erroneous principle in regard to the admittance of those whose income was beyond a certain amount. Such an exclusion at once tends to show that the whole affair is based on false data, or, if not, why may not all be admitted who can pay their quarterly account? Is it that the promoters know that something must be added by private benevolence to make ends meet? If so, the principle is bad, and instead of inducing the would be self-supporting man to join, he is excluded by

the idea that he thereby becomes the recipient of charity. While again those who have high wages, and of course stand in a higher position as regards rank, are expressly excluded, while they would be of great use not only by inducing others to join, but in managing the business of the club. And from these causes the matter is left in the hands of the squire and clergyman to do as they please, and to use their power for the purpose of confining their subordinates within their own rules; and, instead of having a well ordered state of society composed of all grades, where the influence and example of the higher may stimulate the lower to follow, we have only the two extremes of wealth and poverty, and can it be wondered at that the whole comes to the ground? for even the poorest and most cringing serf will get tired of close control; but if he sees a prospect of managing his own affairs, he will feel very differently, and will feel that he belongs to a body of men that are endeavouring to stand on their own resources. But it is useless to think that any artificial props will raise the labourer from that slough of degradation to which he has sunk, or rather that he has been left in; for while other classes have got hold of the ladder, on which by perseverance they may rise, and have risen, the labourer has not had the same facilities placed within his reach. The foundation must be laid in the shape of a good and sound education;—not that sort alone that as yet passes by the name, which consists of a little reading and writing, and in their being constantly reminded that they are members of this or that section of the church, to the exclusion of every other topic. To my mind, the great defect hitherto has been in not teaching the study of human nature as it is, and ought to exist in each individual as regards his position in the social scale. Man ought certainly to be taught in the first place his duties as a Christian, to know the value of that religion that is indispensable to his own welfare. But he ought also to be taught his duties as regards his fellow-man, and his position in society; and in order to fit him for this, he ought to be taught to form something like an estimate of human character, as it is shown around him. We know that we are taught among our first lessons that we are to do our duty in whatever station it has pleased God to put us; but how few are taught what those duties are. How few of those who are called intelligent are aware of the charge committed to them on that account! It would seem that the use of this rule as understood, is to teach one party that they are to rule, and the other that they are to obey. Surely it would be well that we were taught our duties more in detail: that in being taught to do justice we were taught how full of meaning that word was—in how many and various ways it ought to affect the relations of life. But we must allude to the last and to many the easiest way of benefiting the poor labourer—that is, by direct almsgiving, and we do think that the less there is of this the better, for it is very far from inducing him to think himself a man, and consequently to try and act as such. There are many friendly offices that may be conferred upon him that will not, as this, stifle any spark of manly feeling. This almsgiving is no doubt an agreeable thing to a benevolent feeling, but if the giver would only consider with himself what are the duties that he owes to society, he will find many more important things that he may do for the benefit of those below him, and above all let him remember that the best way to do good to any one is to put them in the way of benefiting themselves. For it is true that "God helps those that help themselves;" so let them go and do likewise. *G. S.*

Societies.

ROYAL AGRICULTURAL SOCIETY.

Weekly Meeting, *March* 15.—Colonel Challoner, Trustee, in the chair.

A letter was read from Mr. Ellison, of Sizergh Castle, Westmoreland, conveying his 47 years' experience on the subject of "fingers-and-toes" in Turnips. As he had a great variety of soils on his farm, on none of which that excrescence had resulted until last year, he believed the nature of the soil to have but little, if any influence in that production. This exceptional piece of land was a 5-acre field of very bad limestone soil, which last year bore only a half crop; and which had failed, in Mr. Ellison's opinion, on account of the imperfect manner in which the seed had been steeped previously to sowing. He concludes his communication by stating the manner in which his steeping process was conducted, and his opinion of the good effects produced by the caustic urine on the seed by the destruction of any noxious germs it might be supposed to contain. He recommends the seed to be sown on the same day that it has been steeped, and that manured land should never be left unsown the same day the manure is put into it. —The reading of this communication was followed by a discussion on the preparation of seeds for sowing; in which Colonel Challoner, Mr. Burke, Mr. Fisher Hobbs, Lord Camoys, Mr. Raymond Barker, Lord Lovaine, M.P., Colonel Hall, Mr. Bullen, Mr. Mainwaring Paine, and Mr. Wrench took part. The following were the principal points on which the discussion turned:—1. On the French steep for seed Wheat, of which a supply had been left some time ago at the Society's Rooms by Mr. Fisher Hobbs, for such members as might feel disposed to try it and report upon its effects. 2. On steeping Mangold Wurzel seed in manure water, in dry seasons; and on allowing it, according to the late Mr. Burness's method, to sprout before sowing. 3. On dibbling Mangold Wurzel seed. 4. On the application of river slime (from decomposed Reed), dug up near Tooting, and applied as a manure for Mangold Wurzel, producing a crop of 71½ tons to the acre. 5. On the preparation of Carrot seed, and on the advantage of sowing it with a small hand drill on light soils, where the pressure of horses' feet would injure the texture of the land, and cause it to produce clubbed Carrots. 6. On the occurrence of excrescences in root crops grown on trodden gravel, or sandy soils; their absence on chalk and marl, even when trodden; and their disappearance on Mr. Paine's gravel or sandy soils in Surrey, on the application of marl. 7. On the prevalence of finger-and-toes in Berwickshire and Northumberland, and on lime being successfully used in those counties as a specific for the disease in question.

The Rev. S. N. Kingdon addressed to the Council a letter on the stoppage of drains, by a substance which appeared to him to be common Couch-grass; and Mr. W. Taylor, on a proposal for the trial of a plan of Potato cultivation.—The Imperial and Central Agricultural Society of Paris, the Horticultural Society of Rouen, the New York State Agricultural Society, the Georgofili Academy of Florence, and the Imperial Agricultural Society of Vienna, presented copies of their respective Transactions; and the American Commissioners of Patents, copies of their reports connected with Agriculture and the Mechanical Arts; for which the best thanks of the Council were ordered.

Adjourned to March 22.

Agricultural Improvement, of Ireland, *March* 7. —Mr. Harkness read a paper on *The several kinds of Manures which it is advantageous to apply in Agriculture*, from which we make the following extracts:—

Encouragement to the application of bones, superphosphate, guano, or any other special manures, ought not to subtract from the value, or to discontinue the making, of farm-yard manure. Yet still, as it is an important position to establish, that farm-yard manure produces the most profitable results, when used with a considerable diminution of dung, and the addition of special manures, somewhat in the proportion of half the value of the whole, we shall be excused in adducing some experiments which illustrate the principle.—1. In April, 1844, Mr. Gardner, at Barrochan, Scotland, applied 3*l.* 15*s.* worth of farm-yard dung along with special manures—viz., animal charcoal, sulphuric acid, gypsum, nitrate of soda, and common salt, to the amount of 18*s.* 6*d.* worth, from which he obtained a return of 20 tons 3 cwt. 19 lbs. of Potatoes per acre, while 25 tons of farm-yard manures produced only 14 tons 1 cwt. of Potatoes per acre, the expense being estimated the same for manure—viz, 4*l.* 13*s.* 6*d.* 2. In another case, Mr. Gardner, with an application of 15 tons of dung, and eight separate special or foreign manures, altogether valued at 7*l.* 12*s.* 4*d.*, grew 21¾ tons, while 30 tons of farm-yard manure, valued at 7*l.* 10*s.*, yielded only 13 tons 5 cwt. Similar results were obtained by Mr. Gardner in growing Carrots and Swede Turnips, with equal values of manures, the crop grown with farm-yard dung and special manures having yielded between 11 and 12 tons more produce per acre than that grown entirely upon a large quantity of farm dung. Referring to the tables of the Locherbey Club for 1853, I think the following remarks by the Club very appropriate, in reference to the application and advantage of using special manures along with farm-yard dung, in growing green crops. "The tables show that yearly the quantity of extra manure given is on the increase, and confirm the practice, which is becoming every year more general, of giving bones either raw or dissolved, along with guano and dung. The great crops of Hardgrave for several years brought this under notice; and the large weights of all sorts at Dalfibble, Shaw, and Barnsdale (the two latter at an elevation of 500 feet and second-rate quality of soil), which appear in the tables of this year, may extend still more the practice of applying bones in both forms." "One member showed, from a distinct set of experiments, in each of the last seven years, and on different varieties of soil, that dissolved bones, at the same expense, produced equal results in the Turnip crop with guano, while the greater permanency of its effects on the succeeding crops is acknowledged." This report, by a class of as shrewd farmers and careful observers as can be found in any country, is very strong indeed. The conclusion come to by them, however, is quite in harmony with many experiments and reports on the same subject. Meantime, it seems beyond a reasonable doubt, as regards green crops, that properly dissolved bones are quite equal to, and therefore a good substitute for, Peruvian guano, and not so expensive or difficult to be got. If, in addition, the nitrates be found to supply as advantageously the nitrogen or ammonia necessary for the green crops, the farmer's resources will be in no small degree bettered, and by combining phosphates with nitrates, the expense of the manure may be ultimately reduced, without diminishing its practical efficiency, or increasing its expense beyond that of guano.—Glancing back then upon some of these leading elements of the general question, it is obvious that the economical manufacture of bone-dust, the dissolution of the bone, the formation of soluble phosphates, and the cheapest and most effective method of applying such bone manure, are matters of the first consequence to the agriculturist. Peruvian guano, at 13*l.* or 14*l.* per ton, will not do for farmers generally, and the nitrates being considerably higher in price per ton, it is obvious their nitrogenous element will require to be cautiously drawn upon in the compounding of a manure, which must necessarily be composed of phosphates and alkalies.

As to the practice of liquid manuring, the following is interesting:

Some days ago I went out to Larkefield farm, to see Mr. Littleboy, the intelligent land steward of Counsellor Fitzgibbon. I had some conversation with him as to the effect and expense of distributing liquid manure. He has furnished me with his calculations, which I shall now read. "In calculating the cost per acre for watering our Mangold drills, I find that one man and horse, with boy assisting, were able to water an Irish acre in about three hours, distributing on the top of the drills 1254 gallons per acre. Our liquid cart holds about 209 gallons. The wheels are drawn along the alleys, and four drills are watered at a time. One load waters eight drills, giving each 26¼ gallons per drill of 204 yards in length. Forty-eight drills make 1 acre. The tank was very convenient to the field, and a load was put out every half hour; six loads finished the acre.

COST PER IRISH ACRE.

One man and horse, 3 hours	£0	1	6
Boy	0	0	4
	£0	1	10

"I consider the liquid an excellent stimulant for young plants, either Mangolds or Turnips, and the above is a correct statement of the cost, but of course the distance would vary the cost very much." In reality, then, the expense of liquid manuring is but trifling, and not at all difficult, even with the liquid manure cart. The nitrates and phosphates could be easily dissolved either in urine or common water, and thus distributed with greater vegetative effect than the application of solid or dry manure could accomplish. Of course the distribution could be more efficiently, and, on the whole, more profitably distributed by metal pipes, and either gravitation power or by the steam force pump.

Farmers' Clubs.

Fettercairn, *Feb.* 26.—Sir J. S. Forbes, Bart., made the following observations on *Ventilation*. In referring to the ingenious system of ventilation invented and patented by Mr. Watson, of Halifax, I may very shortly remind you that the portion of the air of the atmosphere without which life and combustion cannot be maintained is called oxygen, and constitutes one-fourth of its whole bulk. Whenever that portion is seriously diminished, the lungs become oppressed, and we breathe with difficulty, and hence a constant change of air becomes necessary. You must bear in mind that the same fact maintains in regard to all animals; just in proportion as the air breathed by man or animals is vitiated, the health declines; it thus becomes of importance to effect that change in the most suitable way. Atmospheric air becomes lighter by being heated by respiration or other means, and therefore ascends. The consequence is, that the upper portion of air in a room is always the hottest, and the lower part the coolest; in proportion as it is vitiated by respiration and fire it rises, and the pure air is more and more reduced, until the line which separates them becomes lower and lower, according to the height of the room, sooner or later, down to the level of the persons in the room, who then begin to feel oppressed. The desideratum, under these circumstances, is to refresh the air; and the common plan adopted is to have apertures for the escape of the vitiated air above. The idea that this alone will procure any important relief is quite a delusion. This I can prove to you by a little experiment. A glass bottle without a bottom I place in a trough with a little water in it, to prevent the access of air from below, but with the large neck, equal to one-third of the diameter of the body of the bottle, quite open. This may represent a room with doors and windows close, but with ventilators at the top, only that the aperture here is about 1-9th of the square of the bottom of the bottle, while three or four apertures, of one foot square each, would be thought sufficient in a church or other large place of meeting, though they would not in a building 50 feet square amount to 1-600th part of the area. What then is the effect of this large aperture? I light two candles inside, and, in the short space of half a minute, the tallest of them goes out. The aperture above has not the smallest effect to sustain the combustion of the candles. It is not denied that a certain change of air does take place through this aperture, because, if I light only one candle, it will continue to burn, though feebly; and if, after the candles are extinguished for want of air, I leave the bottle for a considerable time, and then introduce a light from above, the candles will burn without any fresh air from below, the air within having been very gradually renewed; but it is plain that process cannot take effect rapidly enough when the lungs and lights in the room are continuing to exhaust the oxygen below. I may observe, in passing, the effect upon the different candles. The tall candle first goes out, and this will represent the persons in the gallery of a church, who first feel the oppression of the bad air. What remedy, then, has been adopted or attempted in this state of things? Why, none other than the clumsy one of admitting air below. It is quite true, when I hold up the edge of the bottle the fresh air rushes in, the candles burn brighter, and a piece of smoking blotting paper shows the smoke rises readily through the chimney, while it merely circles about the eddy at the junction of the cold and hot air when the only vent is the aperture above; but this remedy is a very questionable one, and I have known many of my friends, near a window suddenly opened at a crowded meeting of this Club, pronounce the cure worse than the disease. Mr. C. Watson, of Halifax, whilst at the head of Messrs. Akroyd & Son's establishment for the daily education of the hundreds of young people employed at their gigantic factories, felt extreme inconvenience from want of ventilation in the school rooms. His health began to suffer; the children were often attacked with sickness and faintings. These facts set him to inquire; and, having heard of the fact, that though an aperture such as we have talked of produced a very gradual and almost insensible change of air while it remained a simple tube, if it were longitudinally divided into equal parts circulation was promoted, he began to inquire into the phenomenon, and soon found that it opened up a source for an important relief from the difficulty he wished to overcome. In effect, it turned out that by this simple apparatus, a rapid change of air was speedily effected, as you will see in the simple illustration of the bottle of which he makes use, and which he suggested to me when he lately paid me a visit here. When I see the candles beginning to burn dimly, I have only to insert in the chimney or neck any thin plate which will, without cement, simply bisect it, and immediately they revive. The vitiated air is rapidly removed on the one side of the plate and replaced by fresh air which rushes down on the other, and the whole is quickly restored to a healthful condition, without draft or inconvenience in the body of the room, or in this apparatus in the bottle, where the candles are quite undisturbed. The explanation appears to be that, from the hottest side of the room, a greater expansion and pressure upwards is created, and instantly a corresponding rush downwards occurs in the other limb, to supply the vacancy thus created. The effect on the comfort of a large meeting, or any situation where pure air is

vitiated, must be obvious. You have only to calculate the rate of the action of the cause, and proportion the means of counteracting it, and the result is infallible. Mr. Watson has invented the ventilator I am now illustrating, and after seven or eight years of unwearied effort has brought it to perfection. It consists of a tube of metal—zinc is found best—of the size required, with a division up the middle, communicating from the roof of the place to be ventilated with the outer air, where it is covered by a cap to keep out the weather, and with valves below worked by pulleys, to proportion its action to the demand from the causes of vitiation below. This is the whole apparatus with which he first cured the school rooms in Halifax. He has now ventilated buildings all over the country. My object in bringing it forward in this place is, of course, its application to farm-buildings, for which, in England and Scotland, it has already been frequently applied. The large amount of air consumed by horses and cattle, and the vitiating effect upon the air of their houses, render it extremely difficult, without danger to their health and condition, to change the air by openings below; but this invention at once solves the problem. For a four-horse stable, a 33-inch ventilator, costing 8*l.*, will entirely remove all effluvia, and keep the air sweet and yet warm; because it is to be observed that, as the hottest of the air at the top of the building is changed, the action is quite gradual, and no draft being admitted below, the lower stratum is never unnecessarily cooled.

Reviews.

Journal of the Bath and West of England Society. Vol. II. Ridgway, Piccadilly.

THE chief object of this Society is to make known throughout its district the best kinds of farm management adopted, whether within or without its limits; and so in its journal it does not aim at "novelty for its own sake;" and although the greater part of the present volume appears now in print for the first time, "the compilers of the journal have no ambition except the very humble one of being useful by enlarging the circle of intelligent thinkers and readers within their own neighbourhood, thereby assisting the young farmer to interpret the facts which his father has taught him to see with his own eyes, and to connect them with the broad principles of science with which every member of a mechanics' institute is familiar; at the same time aiding the educated man in the endeavour to apply his general knowledge to the improvement of his own district, by impressing upon him its peculiarities. These are the motives which seem to justify the repetition of general truths on the one hand, and practical details on the other, which may appear to those who do not know the wants of our district unsuitable or uncalled for."

The object, therefore, is to fill a certain number of pages in the way most useful to the agricultural readers of that particular district; and we must say that it has been most satisfactorily attained by the Society in the instance before us, without going beyond the list of its own members for contributors, or the limits of its own locality for material.

The chief feature of the volume is the large quantity of most seasonable information it contains on the culture of root crops. Mr. Miles contributes a paper on varieties of Wheat, a subject to which he has long devoted considerable attention, as the pages of the "English Agricultural Journal" will testify. A paper on the "Bridgewater Level," and another excellent paper on "Weeds"—Mr. Karkeek on "Hereditary Diseases"—"Reports on the Plymouth Exhibition," and a number of shorter papers collected under the heading, "Farmers' Note Book"—make up the volume. From the last we extract a passage relating to a subject on which its author had already published in our columns:

"*On Feeding Mountain Sheep.* By G. W. Fowler.—As you expressed a wish that I would transmit you particulars of the results of feeding 11 hoggets here last season, I now forward the same.

"*Food.*—I commence with half a pound of oil-cake daily each sheep, soaked in cold water 12 hours, then boiled 20 minutes, and thrown on cut Clover hay, and in about two hours, while quite warm, given to the sheep. Cost of the cake, 8*l.* 10*s.* per ton, arrived here; so that the purchased food, set down at ½*d.* each sheep per day, is fully covered. Swede Turnips cut and a supply always before them, 20 to 23 lbs. daily consumption by each sheep. Clover hay in rack always with them; the decrease of this small, perhaps 2 or 3 lbs. daily each sheep.

"*Mode of Housing.* 1852, *December* 4.—The sheep are placed under cover on sparred oak bars, 1½ inch thick, with 1 inch space between. There is a space of 17 inches below, of which 8 inches were filled with peat ashes, forming a bed for the dung and urine. After the sheep were sold, this was spread with excellent effect upon grain crops.

"*Increase in Weight. December* 6.—The 11 hoggets weighed 907 lbs.

"1853, *January* 3.—Again weighed; result, 1044 lbs.

"*April* 4.—Six hoggets sent to Skinner, butcher, Tavistock; gross weight, 807 lbs.

"*April* 11.—Five hoggets sent to Skinner; gross weight, 729 lbs.

"Total weight of the 11 hoggets, 1536 lbs. The 11 hoggets were feeding 17 weeks and 5 days; average gain during this time 57 lbs., being a trifle over 3 lbs. weekly each sheep during the whole time of the experiment. The hoggets were sold in their wool to Mr. Skinner, of Tavistock, at 7½*d.* per lb.; net money average, 43*s.* 10½*d.* Breed, partly Cotswold, Cheviot, and Dartmoor.

"*Query.*—Was the average increase of field-fed sheep last winter 1 lb. per week? I greatly doubt not.

"I fear that I have not sent you quite so precise a statement as you would wish, but the main features are given. Fifty hoggets next season I hope to feed in the same way."

At the close of the volume is a critical notice of books claiming a place on the farm library, and in the list of essays for which prizes are offered we notice that, beside the information asked for, a list of sources whence that which already exists may be obtained is given.

The whole work well deserves perusal, and will well repay it. We hope to hear of its having a large circulation out of its own immediate district.

Poultry.

POULTRY: *Amateur.* The oatmeal should not be boiled, but mixed with hot water, and given warm in cold weather, or cold in hot. It should be so mixed for general feeding, that when a piece is thrown on the ground, it will break and scatter about. Fowls' eggs will hatch after travelling by railway, though the journey be hundreds of miles.—*M S.* "Sebright Bantams" *must* have double combs; they will hatch their own eggs, and generally prove excellent mothers. If eggs be thoroughly fresh and uninjured when packed, you are likely to get a very good brood from them after they have travelled a distance of 100 miles by railway; we have had nine chickens from 11 eggs, which had travelled 260 miles by railway and 17 by coach. Purchase the eggs of some person on whom you can depend, place them under a hen as soon as possible after they reach you, and the chances are in your favour.

Miscellaneous.

Improvements in Treating Sewage, and in Manufacturing Manure therefrom, by Thornton John Herapath, of Bristol. Patent dated March 15, 1853 (No. 643). This invention consists in causing the phosphoric acid and ammonia of sewage to be precipitated in a comparatively insoluble state by the addition of magnesia or a magnesian compound, at or about the same time as the deodorisation of the said sewage is effected by the addition of some deodorising chemical agent which will not decompose ammonia or its salts. *Mechanics' Magazine.*

Calendar of Operations.

MARCH.

BERWICKSHIRE FARM, *March* 13.—Since Candlemas we have had a series of westerly gales of uncommon violence and constancy, accompanied in the earlier part of last month by sharp frost and a threatening of a return of the snow-storm of January. The consequent dryness of the soil facilitated the completion of spring Wheat sowing, which operation has proceeded to more than average extent on some farms, while others have entirely abstained from it. Lea, most of which was still to plough after the storm, has been much affected by the intense drought, and is not in such good order as it was last year. Turnip land also, where sheep were folded in wet weather, got very hard. Sowing, however, progresses with alacrity; some sticking to the old plan of sowing the Oats first, while most people now find that early-sown Barley has more "bone" in the straw, and consequently carries a head of superior quality. The great deficiency of the Turnip crop admits of the early clearance for that grain. The Wheat plants have been somewhat injured by the late cold weather, but are thick enough in the ground. Clay soils are much in want of sap; but though the wind continues high, it is more southerly, and there is a prospect of some rain immediately. Live-stock markets are rather overcrowded, owing to a want of food; but grain continues to advance, independently of the demand for seed corn. This rise, it appears, is not consequent on the withholding of supplies, for stack-yards are pretty well thinned out; it is therefore the more likely to continue for some time. *J. T.*

Notices to Correspondents.

AGRICULTURAL CHEMISTRY: *A Lady.* Johnstone's "Agricultural Chemistry" is the best book on agricultural chemistry, and Low's "Practical Agriculture"—on good farming. Both subjects are fully discussed in Blackie's "Cyclopedia of Agriculture."

BOOKS: *Anon.* "Youatt on the Horse," of which there are two editions, one with Supplement by Spooner, as well as "White's Compendium of the Veterinary Horse" by Spooner, are standard works.

BRINE: *J Daniel.* Brine is very injurious, and was probably the cause of death. We do not imagine the saltpetre could have been in sufficient quantity to have produced the mischief alone, though it might have assisted. *W. C. S.*

CEMENT: *Bagnalstown* will be obliged by any of our correspondents experienced on this subject, who will tell him what proportion and quality of sand should be used with Portland cement. Also as to quality of any other cement more lasting than Roman or Portland for using between wood-work and stove jambs. [Try just as much cement with the sand as the latter will *hold* of water. On measurement of tradesmen's work any "Builders' Manual," of which there are many, will supply your want.]

DAMP OATS: *E Townend.* They will not hurt the horses. You had better mix them with chaff, so as to hinder them from being swallowed without mastication.

DEVON COW: *W F G F.* You should apply for advice to the editor of the "Devon Herd Book"—Mr. J. T. Davy, Roseash, South Molton.

FARM MANAGEMENT: *The same Neophyte.* Next week. We are glad to give all the information in our power on particular points in farm practice when information or decision is needed, and that is properly the use that should be made by inquirers of these columns; and when the subject is of more than merely individual interest, we are willing to do more than this, and supply such information as we can on the whole scheme of farm management—the capital needed and profits to be expected, &c. &c.—to which your inquiry extends; but both space and time are needed for such a discussion, and we cannot undertake it except at our leisure. We state this in reference to the delay you complain of.

RED CLOVER: *M.* Sow 4 bushels of Sainfoin (rough seed) per acre. It will succeed admirably on your "easy loam on chalk," and it is common now to keep it down for only one year, or at most two, just as Clovers are treated.

SMALL FARM: *J L* has sent us his address, and would be glad to communicate with "Clericus," the writer of the paragraph in page 139, on this subject.

WHEAT: *Rusticus.* You had better apply nitrate of soda 1 cwt., or guano 2 cwt., or sulphate of ammonia 1 cwt. per acre rather than superphosphate, which is rather adapted for the Turnip crop.

SUBSTITUTE FOR GARDEN MATS.—Waxed Sheeting nearly 2 yards wide, 1*s.* per yard run—admits light and excludes cold; Thick Canvass Tarpauling, 1*s.* per square yard; Thick Canvass Waxed Sheeting, 1*s.* per square yard, may be had various widths; these Canvasses are excellent for Roofing Sheds and Outhouses, as they are quite Waterproof. R. RICHARDSON, 21, Tonbridge Place, Judd Street, New Road, London.

BLOSSOM OF FRUIT TREES.—WORSTED NET to effectually protect the blossom of wall fruit trees from frost and blight, and the ripe fruit afterwards from wasps and flies, 7*d.* per square yard, in various widths. All kinds of garden, fishing, and sheep nets, made by machinery, and at very low prices.—R. RICHARDSON, 21, Tonbridge Place, New Road, King's Cross.

WIRE FENCING, 6¾*d.* per Square Yard, in various widths from 6 feet to 15 inches, mesh less than 2 inches. An effectual fence against Hares, Rabbits, Sheep, Deer, &c., and for the enclosure of Poultry, Pheasants, &c.; 4 inch mesh, 4*d.* per square yard.—R. RICHARDSON, 21, Tonbridge Place, New Road, London.

NETTING AND BUNTING FOR FRUIT-TREES, RICK CLOTHS, MARQUEES, TENTS, &c., NEW OR SECOND-HAND, FOR SALE OR HIRE.—BENJAMIN EDGINGTON has prepared for the ensuing season an extensive assortment of Marquees, &c., for Horticultural Societies, Fêtes, Cricket Clubs, &c. Rick Cloths, with poles, pulleys, and lines complete. A great variety of Emigration Tents erected on the premises, 2, Duke Street, Southwark. Warehouse, 32, Charing Cross.—Address, by post, 2, Duke Street, Southwark, London.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, 17, Smithfield Bars, City, and Old Kent Road, Southwark, where may be seen erected Emigrant Tents in great varieties, on their latest improved principles, and also at Brunswick Street, Poplar, near the East India Export Dock.

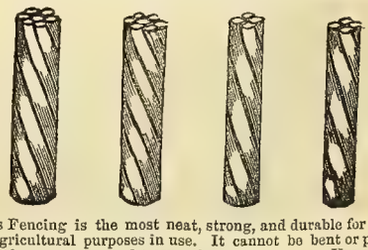
TANNED GARDEN NETTING for protecting Fruit Trees from frost, blight, and birds, or as a fence for fowls, pigeons, Tulips, and seed beds, can be had in any quantity from JOHN KING FARLOW'S, Fishing Tackle and Net Manufactory, 4 and 5 Crooked Lane, London Bridge, at 1½*d.* per yard one yard, 3*d.* two yards, or 6*d.* four yards wide. Carriage free on all orders over 20*s.*, accompanied by a Post Office order, or London reference. Rabbit, Sheep, and Fishing Nets of every description in stock or made to order.

FRUIT TREES, POULTRY, RABBIT, SHEEP, and CAT FENCING.—Worsted Netting to protect the Bloom of Peach, Nectarine, and other Trees, Flower, or Seed Beds, from Frost, Blight, and Birds, 2 yards wide, 5*d.* per yard. NEW TWINE NETTING (Tanned if required), 1 yard wide, 1½*d.* per yard; 2 yards wide, 3*d.* per yard; 4 yards wide, 6*d.* per yard; Half-inch Mesh ditto, 2 yards wide, 6*d.* per yard. TANNED NETTING, 2 or 3 yards wide, 1½*d.* per yard; 4 or 6 yards wide, 3*d.* per yard; or 5*s.* per 100 yards, 1 yard; 10*s.* per 100 yards, 2 yards; and 20*s.* per 100 yards, 4 yards wide. ELASTIC HEXAGON GARDEN NET, or Scrim Canvas, 4½*d.* per square yard. COCOA NUT FIBRE, or Hemp Sheepfolding Net, of superior quality, 4 feet high, 4*d.* to 6*d.* per yard. Rabbit Net, 4 feet wide, 1½*d.* per yard; 6 feet wide, 2½*d.* per yard; 8 feet wide, 3*d.* per yard. Each Edge Corded, ½*d.* per yard extra, suitable for Poultry Fencing. Square Mesh Cricketing Net, fix its full width and length, made of stout cord, 3*d.* to 4*d.* per square yard; this is the best article made for fencing, against fowls, cats, &c., at W. CULLINGFORD'S. Orders by post with Post-office order or town reference, punctually attended to. The Trade supplied. Fishing Nets of all kinds in stock. Nets made to order. Tents, Marquees, Rick Cloths, Tarpaulin, Lines, Rope, Twine, &c., made to order.—1, Edmund-terrace, Ball's Pond Road, Islington, London.

FISHING NETS, POULTRY FENCING.—A 20 yard Drag Net, with Purse complete, 2*l.* 10*s.*; a single Walled Drag Net, any length and depth, 1*s.* per square yard Casting Nets complete, 1*s.* per yard, measured round the lead line; Flue Nets, any size, 1*s.* per square yard complete; Minnow Nets, Eel Nets, Landing Nets, equally cheap, all warranted first-rate quality and workmanship; Rabbit Nets, 4 feet wide, 1½*d.*, 6 feet wide, 2½*d.*, 8 feet wide, 3*d.* per yard; each edge Corded, ½*d.* per yard extra, suitable for Poultry Fencing; square mesh Cricketing Net, fix its full width and length, made of stout cord, 3*d.* to 4*d.* per square yard; this is the best article made for fencing, against fowls, cats, &c., at WM. CULLINGFORD'S, 1, Edmund Terrace, Ball's-pond Road, Islington. Orders by Post, with Post-office order or town reference, punctually attended to. New Twine Garden Netting 1½*d.* per yard.

H. J. MORTON AND CO., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.

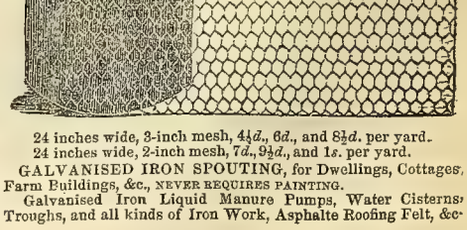
PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

H. J. MORTON AND CO., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



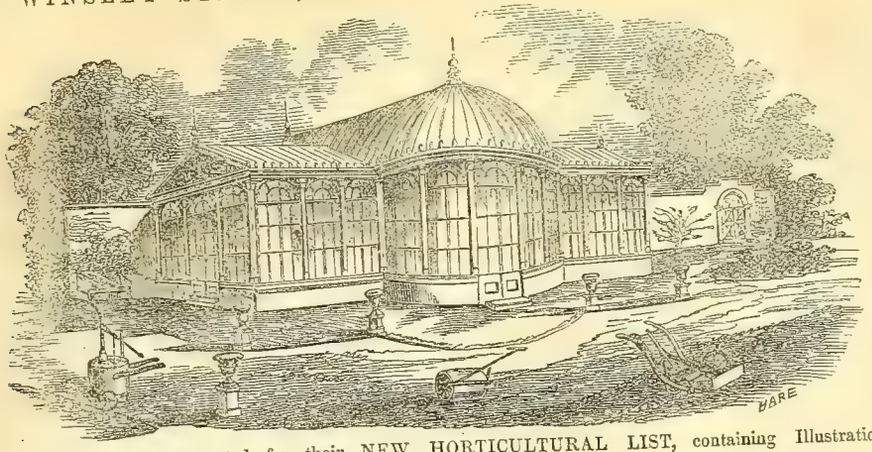
24 inches wide, 3-inch mesh, 4½*d.*, 6*d.*, and 8½*d.* per yard.
24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.

GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.

Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

COTTAM AND HALLEN,

2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.



APPLICATION is requested for their NEW HORTICULTURAL LIST, containing Illustrations, Descriptions, and Prices of

Conservatories, Greenhouses, Hot Water Apparatus, Garden Vases | Mowing Machines, Fountains, Ornamental Wire Work, Flower Stands | Hand-glass Frames, Game Netting, Hurdles, Garden Chairs | Garden Engines, Do. Syringes, Do. Rollers, Flower Labels | Flower Sticks, Garden Bordering, Watering Pots, Garden Arches, &c.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.

AGRICULTURAL LIST UPON APPLICATION.

EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.

EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.

PATENT ENAMELLED MANGERS.

COTTAM, JUN., & Co., 33, Charles Street, Hampstead Road, London.—These Mangers possess all the Latest Improvements, and can be had Plain, Galvanised, or Enamelled, and fitted as Manger-rack and Water-trough—Manger and Rack, or Manger only. Stable Fittings of every description; Hurdles, Strained Wire, and all kinds of Fencing.—33, Charles Street, Hampstead Road.

BUDDING'S LAWN-MOWING MACHINES, with Registered Improvements.
MAPPLEBECK & LOWE, MACHINISTS & MANUFACTURERS, Birmingham.

GIDNEY'S PRUSSIAN HOES.—Gardeners and Amateurs are informed that this useful Tool is now becoming a general favourite in the garden, and only needs a trial to be appreciated. Price 1*s.* 6*d.* handled. To be had of every Ironmonger and Seedsman. Manufactured only by GIDNEY & SON, East Dereham, Norfolk.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d.
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

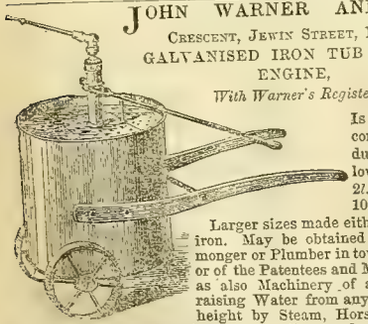
May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,
8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water; Fire Engines, &c.

An Illustrated Book sent on application post free.

JOHN WARNER AND SONS,
CRESCENT, JEWIN STREET, LONDON.
GALVANISED IRON TUB GARDEN ENGINE,
With Warner's Registered Spreader,



Is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes made either in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Syringes of various constructions and sizes from 9*s.* upwards. An extensive assortment kept.

WOOD'S PORTABLE ASPHALTE CAULDRON, with Hot-air Closet for drying Land without extra fuel, commended by the Royal Agricultural Society, Gloucester, to prepare a cheap and durable Flooring for every description of Agricultural Buildings, also Malting Floors, Warehouses, Cellars, Workshops, Yards, Paths, &c. Illustrated Circulars, with prices, will be sent post free, on application to JAMES WOODS, Agricultural Engineer, Stowmarket, or Implement Depot, Bury St. Edmunds. Printed directions, instructing the purchaser as to materials used, and the method of laying the various kinds of Flooring, accompany the execution of each order.

GREAT SAVING OF TIME AND MONEY.

R. RESTELL'S PATENT ECONOMICAL GAS APPARATUS for Forcing Houses, Greenhouses, Conservatories, Pits, Shops, Counting Houses, Warehouses, Drying Rooms, &c. &c., possessing all the advantages of Hot Water at half the expense of fitting, and most trifling cost for Gas, far surpassing any ordinary Gas Stove, requiring no furnace, and allowing of no fumes or evaporation in the Building, or possibility of accidents from negligence or carelessness. It has been tested through the late severe weather, on a variety of Plants, and found most satisfactory. It is very quickly fitted up and requires no night attention.—Apply to the Inventor and Patentee, RESTELL, 25, High Street, Croydon, Surrey.

Persons wishing to have Houses fitted will please to send the and dimensions.

J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. Price complete, with India-rubber suction tube, with galvanised spiral inside, and covered with cotton outside, 25*s.* each. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT

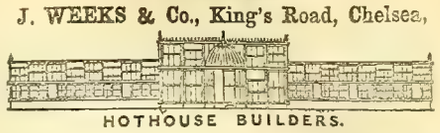
E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

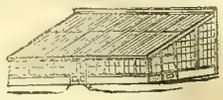
HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,

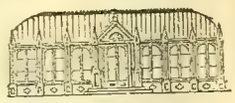


HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

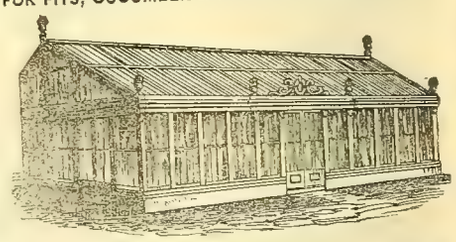


The splendid collections of Stove and Greenhouse Plant, are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS, FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.

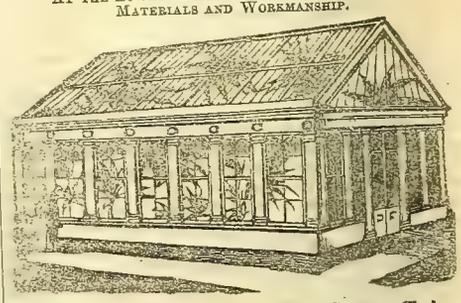


JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in. 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

GREEN AND HOTHOUSES made by machinery at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Warranted of best materials; being made by steam-power, they are put together in a superior manner; one trial will prove these Buildings to be the cheapest and best made in England. 1½ in. Greenhouse lights at 3*d.* per foot; 2 in. at 4½*d.* per foot. Lists of Prices by enclosing two postage stamps.

MORNING FROSTS.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 452, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey. (Removing in May next to 112, Regent Street, London.)

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

FOREIGN GLASS, 16 ounces to the foot, of good quality, in boxes of 100 feet each, suitable for Horticultural purposes. Boxes included.

12 ins. by 10 ins.	15*s.* per box.	18 ins. by 14 ins.	16*s.* per box.	24 ins. by 18 ins.	17*s.* per box.

Also other descriptions of Glass at proportionate prices.

White Lead, Oils, Turps, Colours, &c.

G. FARMILOE & SON, 118, St. John Street, West Smithfield.

HARTLEY'S PATENT ROUGH PLATE GLASS, 1-8th thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th, or 4 lbs. to the foot, for Ridge and Furrow Roofs, Greenhouses, Railway Stations, Engine Sheds, Mills, Market Halls, and Public Buildings generally.

For further information apply to JAMES PHILLIPS & CO., London Agents, 116, Bishopsgate Street Without.

"Rough Plate has never been, and never can be, prejudicial to the colouring of Grapes; though we can easily believe that it has been charged with such a fault by persons who have not skill enough to manage Grapes under glass."—*Gardeners' Chronicle.*

"There *can be no question now* that Rough Plate Glass is the most beautiful, as well as the most useful, kind of glass that can be employed in horticulture. It is free from all the faults of transparent glass, and has many advantages peculiar to itself, *without a single disadvantage as a set-off.*"—*Gardeners' Chronicle.*

"ROUGH PLATE GLASS.—We should have no hesitation in using this for a Vinery—INDEED WE SHOULD SELECT IT."—*Cottage Gardener.*

GLASS FOR CONSERVATORIES, GREENHOUSES, DWELLINGS, ETC.

ESTABLISHED MORE THAN ONE HUNDRED YEARS.

HEAL AND SON'S Stock comprises a large assortment of handsomely Japanned and Brass-mounted IRON BEDSTEADS, CHILDREN'S CRIBS and COTS of new and elegant designs; MAHOGANY, BIRCH, and WALNUT-TREE BEDSTEADS, of the soundest and best manufacture, many of them fitted with Furnitures, complete; and every variety of SERVANTS' and PORTABLE BEDSTEADS. They have also a large assortment of

BED-ROOM FURNITURE, comprising WARDROBES, both in Japanned Wood and Mahogany, from 4 feet to 8 feet long, fitted with every variety of arrangement; DRESSING TABLES and GLASSES, WASH-STANDS, DRAWERS, and every article for the complete furnishing of a Bed-room.

HEAL & SON'S ILLUSTRATED CATALOGUE OF BEDSTEADS and priced List of Bedding, containing designs and prices of upwards of One Hundred Bedsteads (representing a stock of upwards of One Thousand), sent free by post.

HEAL & SON, 196, Tottenham Court Road, London.

TO ARCHITECTS AND BUILDERS.

THE Council of the MANCHESTER BOTANICAL and HORTICULTURAL SOCIETY, being desirous to erect a GLASS EXHIBITION HOUSE, are prepared to receive PLANS and ESTIMATES for such a structure. The building to cover a space of not less than 1000 square yards, and not to exceed the sum of 2000*l.* in its erection. Further particulars may be known on application to Mr. SHAW, 40, Princess Street, to whom sealed plans and tenders must be transmitted on or before the 5th day of April next.

By order, JOHN SHAW, Secretary.

Council Room, 40, Princess Street, March 18.

SEEING IS BELIEVING. (*Times*, Nov. 17, 1853.) MAN HIS OWN BENEFACTOR. The promised PAMPHLET! Extraordinary progress in Vegetation by LIQUID MANURE and AIR to the ROOTS of Plants; humbly dedicated to H.R.H. Prince Albert and Others. Showing by what means Swedes were grown 3 inches round in one week in hot weather; Potatoes reared in 11 weeks free from spot or defect; two Crops in Poor Heath Land in one year applicable to all gardens. Every slop of the house turned to profit. An effectual relief of the distressed Agricultural Labourers to the end of time. Little Farmers' 10 acres of Poor Land warrant their Crops average one pound per day, from Christmas to Christmas, and thankfully pay their landlords 10 per cent. for their outlay. Once done lasts 50 years. Youths 14 to Manhood provide themselves with clothes and pocket money. By EDWARD WILKINS, Patentee, 68, Queen's Row, Walworth, Surrey.—Sold by CASH & Co., 5, Bishopsgate Street; ORDER & MERYON, 174, Fenchurch Street; MANN & Co., 39, Cornhill, London. Price 8*d.*; in stiff cover, 1*s.*

Follow the noble example of JOHN KNIGHT, Esq., Banker, Farnham, Surrey, who is testing, with Hops, Corn, &c. &c. (No time to lose.) The Patentee hopes and believes this gentleman, who does possess immense landed property and wealth, with a disposition to carry it out, will do so to serve his agricultural labourers. How remarkable! first for a good object at the place of the nativity of the Patentee.

METCALFE AND CO.'S PERFUMERY DEPARTMENT.—PROPRIETARY ARTICLES.—METCALFE'S celebrated ALKALINE TOOTH POWDER is acknowledged as the safest and most efficient now in use. Dupuytren's Medicated Pomade is the most certain remedy for preventing the hair prematurely falling off, and for restoring it when baldness has already commenced. Dupuytren's Medicated Balm strengthens, cleanses, and improves the growth, and is generally acknowledged as the best wash for the hair.—Manufacturers of British and Importers of Foreign Soaps, Perfumery, and J. M. Farina's genuine Eau de Cologne, at METCALFE, BINGLEY, & Co.'s only Establishment, 130B and 131, Oxford Street, second and third doors west from Holles Street.

NO CHARGE FOR STAMPING ARMS, CRESTS, INITIALS, &c., on paper and envelopes, at LOCKWOOD'S well-known establishment, 75, New Bond Street. Good cream-laid Note-paper, five quires for 9*d.*; Thick ditto, five quires, 1*s.*; Albert and Queen's sizes, five quires for 6*d.*, 9*d.*, and 1*s.*; Envelopes, 3*d.* to 1*s.* 6*d.* per hundred; Foolscap paper, 7*s.* 6*d.* per ream; Copybooks, 2*s.* 6*d.* per dozen. Card Plate engraved, 2*s.* 6*d.*; 100 Cards printed, 2*s.* 6*d.* Mourning Stationery equally cheap. Wedding Orders promptly executed. A large variety of Writing and Dressing Cases, Envelope Boxes, Blotting Books, Inkstands, Gold Pens, Church Services, &c. Copy address, LOCKWOOD'S, 75, New Bond Street. Country orders for 20*s.* sent carriage free.

HYGIENIC BATHS, A POWERFUL PROMOTER OF HEALTH AND WELL-BEING.—JENSEN'S Herbaceous Daphne Marina Salt for Baths, when dissolved in a cold, tepid, or warm bath, imparts so eminently strengthening and beneficial properties to the same, that, when once tried, a bath will scarcely ever be taken without it. In the buoyancy and freshness it produces in the system, it is far superior to any known sea bath. Highly recommended by that distinguished Physician, Dr. Andrew Ure, M.D., F.R.S., &c.—Sold at 1*s.* per Packet, by C. MEINIG, 103, Leadenhall Street, and by all Chemists and Bathing Establishments.

QUANTITY AND QUALITY OF THE HAIR.

NO TOILET can be considered complete without a careful attention to that department which so materially affects the entire contour, viz., the Hair, which, both in quantity and quality, is susceptible of the most material alteration. That which is weak can be strengthened, and be made to receive a most beautiful gloss by artificial applications. It is to its extraordinary and valuable properties in these respects that is due the character of C. AND A. OLDRIDGE'S BALM OF COLUMBIA, for its invigorating, nutritious, and regenerative qualities. OLDRIDGE'S BALM causes Eyebrows to grow, prevents the Hair from turning grey, and the first application causes it to curl beautifully, frees it from scurf, and stops it from falling off. Price 3*s.* 6*d.*, 6*s.*, and 11*s.* per bottle. No other prices are genuine.—N.B. Ask for OLDRIDGE'S BALM, 13, Wellington Street North, Strand, London.

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL possesses singularly nourishing powers in the growth, restoration, and improvement of the human Hair, and when every other specific has failed. This celebrated Oil is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. Its operation in cases of baldness is peculiarly active; and in the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulating operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3*s.* 6*d.* and 7*s.*; Family Bottles (equal to four small), 10*s.* 6*d.*; and double that size, 21*s.* CAUTION.—On the wrapper of each bottle are the words, Rowland's Macassar Oil, in two lines. The same are engraven on the back of the wrapper nearly 1500 times, containing 29,028 letters.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

PAINS IN THE BACK, GRAVEL, LUMBAGO, RHEUMATISM, GOUT INDIGESTION, FLATULENCY, NERVOUSNESS, DEBILITY, &c.

DR. DE ROOS' COMPOUND RENAL PILLS, as their name Renal (or the Kidneys) indicates, are a most safe and efficacious remedy for the above dangerous complaints. For depression of spirits, incapacity for society, study, or business, giddiness, drowsiness, nervousness, and insanity itself, when arising from or combined with urinary diseases, they are unequalled. Price 1*s.* 1½*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 11*s.*, and 33*s.* per Box, through all Medicine Vendors, or sent (free) on receipt of the amount in postage stamps, by Dr. DE ROOS, 35, Ely Place, Holborn, London. At Home for consultation daily from 11 till 1, and 5 till 8, Sunday excepted. Advice and Medicines, 1*l.*

HOLLOWAY'S PILLS REMARKABLE FOR THEIR EFFICACY IN CURING DROPSY.—Mrs. Nicholls, of Longton, had been a sufferer for years from a troublesome Cough, Shortness of Breath, and a constant lassitude of feeling, rendering her unwilling to move or attend to her domestic duties. She had the advice of several Medical practitioners without deriving any benefit whatever; shortly afterwards, about the meridian of life, her various complaints settled into a confirmed Dropsy, and no hopes whatever were entertained of her life; however, by a steady perseverance in the use of HOLLOWAY'S Pills, she soon improved in health, and is now completely recovered, being better than ever she was before.—Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1 and 2, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s.*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,

2dly,—From those purchases being made exclusively for cash.

THE PERFECT SUBSTITUTE for SILVER.—The real NICKEL SILVER, introduced 20 years ago by WILLIAM S. BURTON, when Plated by the patent process of Messrs. Elkington & Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either usefully or ornamentally, as by no possible test can it be distinguished from real silver.

CUTLERY WARRANTED.—The most varied assortment of TABLE CUTLERY in the world, all warranted, is on Sale at WILLIAM S. BURTON'S, at prices that are remunerative only because of the largeness of the sales; 3½-inch ivory-handled table knives, with high shoulders, 11*s.* der dozen; desserts to match, 10*s.*; if to balance, 1*s.* per dozen extra; carvers, 4*s.* per pair; larger sizes, from 14*s.* 6*d.* to 26*s.* per dozen; extra fine, ivory, 32*s.*; if with silver ferrules, 37*s.* to 50*s.*; white bone table knives, 7*s.* 6*d.* per dozen; desserts, 5*s.* 6*d.*; carvers, 2*s.* 3*d.* per pair; black horn table knives, 7*s.* 4*d.* per dozen; desserts, 6*s.*; carvers, 2*s.* 6*d.*; black wood-handled table knives and forks, 6*s.* per dozen; table steels, from 1*s.* each. The largest stock in existence of plated dessert knives and forks, in cases and otherwise, and of the new plated fish carvers. Also a large assortment of Razors, Penknives, Scissors, &c., of the best quality.

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares), Iron and Brass Bedsteads, so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); Nos. 1 and 2, Newman Street; and 4 and 5, Perry's Place.

THE MECHIAN DRESSING CASE, the most portable ever invented, being only the size of a pocket-book, containing One Pair of MECHI'S Ivory-handled Peculiar Steel Razors, his Magic Strop, Comb, Badger-hair Shaving Brush, and Nail and Tooth Brushes, price only 25*s.*; the same with Hair Brush and Soap Dish, 35*s.* To military men, and as a steam-boat or travelling companion, this invention is an invaluable acquisition. An immense variety of other Dressing Cases for ladies and gentlemen, either in fancy woods or leather, at all prices, to suit either the economical or luxurious. An extensive stock of Writing Desks, Writing Cases, Work Boxes, Bagatelle Tables, Razor Strops, Table Cutlery, Superb Papier Maché articles, &c.—Manufactory, 4, Leadenhall Street, four doors from Cornhill.

DINNEFORD'S PURE FLUID MAGNESIA has been for many years sanctioned by the most eminent of the Medical Profession, as an excellent remedy for Acidities, Heartburn, Headache, Gout, and Indigestion. As a mild aperient, it is admirably adapted for delicate females, particularly during pregnancy; and it prevents the food of infants from turning sour during digestion. Combined with the Acidulated Lemon Syrup, it forms an Effervescing Aperient Draught, which is highly agreeable and efficacious.—Prepared by DINNEFORD & Co., Dispensing Chemists (and General Agents for the Improved Horse-Hair Gloves and Belts), 172, New Bond Street, London, and Sold by all respectable Chemists throughout the Empire.

PAUL GAGE'S ELIXIR.—This valuable family medicine has been established 44 years as the best remedy for PHLEGM, and all the disorders arising from it, viz., bilious complaints, indigestion, colds, coughs, catarrh, asthma, worms, hooping cough, colics, cholera morbus, ague, fevers, gout, scrofula, nervous affections, female complaints, &c. It is demonstrated in a pamphlet on Phlegm, delivered gratis at all the depots, why PAUL GAGE'S ELIXIR has not failed in desperate cases, where other means have been found of no avail. Sold in bottles at 2*s.* 9*d.*, 4*s.* 6*d.*, and 11*s.*, by PAUL GAGE, 462, New Oxford Street; and by all respectable medicine vendors.

ELECTRICITY FOR NERVOUS, FUNCTIONAL, AND RHEUMATIC DISEASES.

MR. MEINIG'S new and greatly improved GALVANIC ELECTRO GENERATOR, for supplying vito-functional energy to any organ in want of the same, and to the system generally, may now be had at the Establishment, 103, Leadenhall Street. All wet and metallic contact with the body is entirely obviated; it acts with water alone, without acid, the action lasts more than 24 hours after each damping, and can be renewed and regulated without undressing, the Generator, enclosed in an envelope, being carried in the pocket or suspended from the neck. The extraordinary curative virtues of these mild currents of Electricity are now fully established by experience; the Prospectus (to be had gratis, or by post for two stamps) contains the names of more than 600 persons cured within the last 18 months, and this remedy is now adopted in nearly all the hospitals, and by the most eminent practitioners. Sold at 5*s.* upwards, according to power, at C. MEINIG'S, 103, Leadenhall Street. N.B.—It is impossible, when wearing a Generator, to be attacked by Cholera.

CURE OF CHRONIC COUGH, BY DR. LOCOCK'S PULMONIC WAFERS. From Mr. J. Smedley, Bookseller, Sleaford, Oct. 22, 1853.—Gentlemen: I can speak with confidence, particularly of the Pulmonic Wafers, with which I have been not only relieved, but cured, of a Chronic Winter Cough. Hundreds of boxes I have sold, and still the sale is as great as ever. Signed, J. Smedley.—Dr. Locock's Pulmonic Wafers give instant relief and a rapid cure of Asthma, Coughs, and all disorders of the breath and lungs. To singers and public speakers they are invaluable, for clearing and strengthening the voice. They have a most pleasant taste—Price 1*s.* 1½*d.*, 2*s.* 9*d.*, and 11*s.* per box. Sold by all chemists.

"This serial, which will form quarterly eighteenpenny volumes, is, we are disposed to think, the best literary investment of a penny a week now extant."—*Examiner.*

"This series, besides affording popular but sound instruction on scientific subjects, with which the humblest man in the country ought to be acquainted, also undertakes that teaching of 'common things' which Lord Ashburton and every well-wisher of his kind are anxious to promote."—*Times.*
London; WALTON & MABERLY, Upper Gower Street, and Ivy Lane, Paternoster Row.

CHEAP FUEL AND DEAR COALS.—Excellent GAS COKE, in quantities of 20 Chaldrons and upwards, loaded in one day, by barge or by cart, from the PHŒNIX GAS WORKS, 70, Bankside, Southwark, or at the upper side of the Bridge foot, at Vauxhall, at the low price of 12s. per Chaldron. Terms—Cash with the order. The above Coke is in use in the best Conservatories.

TO NURSERYMEN AND OTHERS.
TO BE LET, about 45 Acres of GARDEN and NURSERY GROUNDS, planted with Fruit Trees and Plants, with two Residences thereon, containing several rooms, with barn, stable, and other outbuildings, in Essex, about 45 miles from London and 2¼ miles from the Braintree Railway Station, and near to Witham, on the Eastern Counties Railway, at the very low rent of 100l. a year.—Apply to Mr. AMBROSE, Solicitor, 7, Manchester Square, London.

TO FLORISTS AND OTHERS.
TO BE LET, with immediate possession, a desirable and convenient Nursery, established nearly 40 years, situated about four miles south of the metropolis, comprising a Dwelling House and Seed Shop, 10 Greenhouses, Pits, Frames, and other convenience. Satisfactory reasons will be given by the Proprietor for retiring from the business.—For further particulars, address A. B., Mr. FORBES, Seedsman, near the Elephant and Castle, Southwark.

CROYDON, SURREY.
TO BE LET, with possession at Lady-day, about 30 acres of good LAND, well adapted for Market Garden purposes, being close to the town. For terms apply to Messrs Blake, Croydon, Surrey.

SOMERSET.
TO BE LET, with immediate possession, a PUBLIC HOUSE, with large Grapery attached, known as the Railway Inn, and adjoining the Yeovil Station. The Hothouse is 140 feet long, well stocked with choice Vines, and there is a good business in the Plant and Seed way. Coming in easy.—Direct, prepaid, to Mr. MASON, Brewery, Dorchester, Dorset.

WANTED, three or four PEA HENS between the ages of two and four years. Price and particulars to be addressed to E. M., Post-office, Birches Green, near Maidenhead.

COCHIN CHINA POULTRY, ETC.
EGGS FROM PRIZE BIRDS.
MR. JOHN FAIRLIE, of Cheveley Park, Newmarket, in reply to the very urgent applications from numerous amateurs, is now prepared to dispose of a limited number of Eggs, from his celebrated prize Cochins, Brahma Pootras, Scotch Bakies, Dorkings, &c., according to the dates of the orders received.

MR. GILBERT, of Grays, Essex, having entered into an arrangement with THOMAS STURGEON, Esq., for the Purchase of the whole of his remaining Stock of COCHIN CHINA Fowls, bred by him in 1853, Gentlemen and Amateurs are informed the Birds are now on Sale. Eggs may be had from the above birds at 20s. per dozen.

BRAHMA POOTRA FOWLS' EGGS for Hatching, 30s.; white-faced Spanish, 15s.; Dorking, 6s.; Aylesbury Duck Eggs, 6s. per dozen. A Brahma Pootra Cockerel and white-faced Spanish Fowls for Sale. Remittance with all orders to WM. TURNER DRAYTON, Abingdon, Berks.

EGGS FOR HATCHING FROM PRIZE BIRDS.—The Birds from this breed have taken the Prize at Birmingham for three years together; Gloucester, in 1853; London, in 1853; Manchester, in 1854; and other local shows. Golden Spangled Hamburghs, 9s. per dozen; also, Silver Spangled Hamburghs, of a first-rate breed, 5s. per dozen; packing included.—Apply to H. CLAPHAM, Esq., Aireworth House, Keighley, Yorkshire.

TO AMATEURS OF THE HAMBURGH FOWLS.—A few sittings of Eggs of each class of the Hamburgh Fowls, viz.:—Gold and Silver Pencilled, Gold and Silver Spangled, and Black, to be disposed of in the spring, from birds which have taken thirty prizes at most of the principal Shows during the past season. Eggs will be supplied according to the dates of the orders received. Also, Eggs of Prize Game Fowls and Aylesbury and Rouen Ducks.—Apply to the Feeder, Mr. ROBERT HUGGINS, Beighton Rectory, Acle, Norfolk.

AYLESBURY DUCKS' EGGS.
TO BE SOLD, EGGS warranted from the best selected White Ducks, good shape, bill and legs fine and a good colour, 6s. per dozen, including packing. Early application to secure them at the above price is necessary.—Apply to WILLIAM HENRY GREEN, Builder, Walton Street, Aylesbury.

LIGHT BUFF COCHIN CHINA FOWLS' EGGS.—An Amateur having a first-rate stock of Light Buff Cochin China Fowls from Prize Birds, and more eggs than he requires for his own use, is willing to part with a few sittings at a reasonable price—5s. 6d. per doz., box included.—Address "Chanticleer," Post-office, Farnham, Surrey.

Sales by Auction.

FANCY POULTRY—PERIODICAL SALE.
MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 21st March, at 12 o'clock precisely, a very choice selection, including BRAHMA POOTRAS, COCHINS, &c., from the yards of J. Fletcher, Esq., Rev. J. Hutchinson, J. Nightingale, and others, many being 1st class birds. Also a few pure PTARMAGANS, bred by Dr. Burney, and other Fancy Stock.—Catalogues, by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

FANCY POULTRY—EXTRA SALE OF CHOICE STOCK.
MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 28th March, at 12 o'clock precisely, a SELECTION OF COCHINS from Lord Cottenham's yard; the entire brood stock of 1st Class Cochins belonging to Mr. Stainton, some good birds from Mr. Bridges, Mrs. Fooks, and others.—Catalogues by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

TO GENTLEMEN, FLORISTS, AND OTHERS.
MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on FRIDAY, March 24th, at 12 o'clock, a first-rate collection of CARNATIONS, PICOTEES, and PINKS; also a choice assortment of Standard and Dwarf Roses, American Plants, fine Dahlias in dry roots, Pæonias, Fuchsias, and Verbenas; together with about 100 fine double Camellias well furnished with bloom buds.—May be viewed the morning of sale; Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

FULHAM ROAD, CHELSEA.
To NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, & OTHERS.
MESSRS. PROTHEROE AND MORRIS are instructed by Mr. D. Smith to submit to public competition by Auction, on the premises, Stewart's Grove Nursery, Fulham Road, Chelsea (late in the occupation of Mr. Westmacot), on MONDAY, March 20, without reserve, in consequence of the land being required for building purposes, 7 newly erected Greenhouses, several Pits and 2-Light Boxes, about 1300 feet 2, 3, and 4-inch Hot-water Pipe, 3 capital Saddle Boilers, and excellent Shop Front; useful Light Cart Horse, Iron Posts, Stages, &c. May be viewed prior to the sale; Catalogues had (6d. each, returnable to purchasers), of Mr. D. SMITH, 4, Upper Queen's Buildings, Brompton; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

IMPORTANT AND ABSOLUTE SALE OF MAGNIFICENT SPECIMEN PLANTS.
MESSRS. PROTHEROE AND MORRIS are instructed by J. M. Yeeles, Esq., of Bathford, near Bath, to submit to public competition by Auction, without reserve, on the premises, on WEDNESDAY, March 22d, at 11 o'clock, in consequence of his declining their cultivation, the whole of his unrivalled collection of SPECIMEN, ORCHID, STOVE, and GREENHOUSE PLANTS, many of which are not equalled in this country as splendid examples of superior culture, and just in condition for the coming season's exhibitions. They comprise Saccolabium, Dendrobium, Ixora, Gardenia, Franciscea, Allamanda, Echites, the best kinds of Ericas, Azaleas, Ixoras, Leschenaultias, Boronias, Pimeleas, Aphelexes, Eriostemons, and almost every kind of exotic plant worth culture for exhibition.—May be viewed two days prior to the Sale. Catalogues may be had 6d. each, returnable to purchasers, on the premises; the Castle and Ball, the Greyhound, of the principal Seedsmen in Bath; Messrs. Garraway and Mayes, Nurserymen, Bristol; of Mr. Glendinning, Chiswick Nursery, Turnham Green; the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.
MR. J. WILLMER will sell by Auction, at the Mart, Bartholomew Lane, on WEDNESDAY, March 22, at 12 o'clock, a choice collection of Carnations, Picotees, Standard, Dwarf, and Climbing Roses, Dahlias in dry roots, fine Lancashire Gooseberries, and other Miscellaneous Plants.—May be viewed the morning of sale; and Catalogues had at the Mart; and of the Auctioneer, Sunbury, Middlesex.

TO GENTLEMEN, FLORISTS, AND OTHERS.
MESSRS. MUMFORD AND CASEBOW are instructed by Thomas Ingle, Esq., M.D., of Wood Hall, Hilgay, near Downham Market, Norfolk (who is removing from Wood Hall), to Sell by Auction, on FRIDAY, March 31, a nearly new STOVE and GREENHOUSE 54 feet long by 13 feet, a CONSERVATORY 26 feet by 16 feet, an ORCHID HOUSE 20 feet by 16 feet, all fitted up complete; together with all the rare and valuable Orchid, Tropical, and Greenhouse Plants, including a very choice selection of carefully hybridised Fuchsias, Gloxinias, Gesneras, and Cacti not yet flowered; excellent Cucumber and Melon Frames, Copper Steamer and Pipes, Lead Pumps, &c. &c., the whole of which are fully described in Catalogues, which may be had of the Auctioneers, Downham Market, at 1s. each (to be returned to purchasers); or if forwarded by post by an enclosure of 12 stamps. May be viewed the day previous and morning of sale. Sale will commence at 11 o'clock precisely.

FIGURES, FOUNTAINS, VASES, ETC.
To PRIVATE GENTLEMEN, BUILDERS, & OTHERS.
MR. PEAKE is directed to Sell by Auction, on the Premises, 74, Borough Road, Newington Causeway, on TUESDAY, March 21st, 1854, at 12 o'clock, without reserve, the Genuine Stock in Trade of the Artificial Stone Works, comprising a great and pleasing variety of Figures, Fountains, Vases, Ornaments, and other elaborate works of Art, suitable for embellishing Gardens and Pleasure Grounds, well worthy the attention of private Gentlemen and others. Also a variety of Curbing, Closet Pans, &c. Likewise the Lease, Goodwill, and Implements in Trade of the old established business which has been successfully carried on there for the last 15 years.

May be viewed prior to the Sale, and further information, with Catalogues, had on the Premises, and at Mr. PEAKE'S Offices, 44, Tooley Street, and 4, Fair Street, Southwark.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church Row, Stoke Newington, both in the County of Middlesex, Printers, at their Office, in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, MARCH 18, 1854.

HORTICULTURAL SOCIETY OF LONDON.
PRIVILEGED TICKETS.

The Exhibitions will take place on the Second Saturdays in May, June, and July, namely—

MAY 13, JUNE 10, JULY 8.

All Fellows who shall apply, on or before Tuesday the 25th of April, may obtain, at the rate of Three Shillings and Sixpence each, any number of Tickets NOT EXCEEDING THIRTY-SIX; but no application for such tickets will be received after that day. *Fellows of the Society subscribing for tickets at this price will be allowed a clear week from the 25th of April during which they may claim them.* AFTER THAT PERIOD ALL THE 3*s*. 6*d*. TICKETS SUBSCRIBED FOR, BUT NOT ISSUED, MAY BE CANCELLED.

After the 25th of April, any further number of tickets will be delivered to Fellows on their personal application or written order, at the price of *Five Shillings* each ticket.

SPECIAL PRIVILEGE OF FELLOWS.—Fellows of the Society enter free at half-past 12, and can introduce TWO friends WITH TICKETS; or the Fellow's privilege may be transferred to a brother, sister, son, daughter, father, mother, or wife, residing in the Fellow's house, provided the person to whom the transfer is made be also furnished with a ticket signed by that Fellow. That is to say, the privilege of entering early may be transferred, but not the privilege of FREE admission.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—
The days appointed for the EXHIBITIONS of PLANTS, FLOWERS, and FRUIT this season are WEDNESDAYS, May 24, June 21, and July 5; and of AMERICAN PLANTS, MONDAYS, June 12 and 19.

Tickets of Admission can be obtained at the Gardens by orders from Fellows of the Society. Price on or before May 13, 4*s*.; after that day, 5*s*.; or on the days of Exhibition, 7*s*. 6*d*. each.

The Plants will be arranged on a new plan, similar in form to the American Garden, being placed upon terraces.

GRAND HORTICULTURAL EXHIBITION,
AT RIPON, (Open to all England), on Wednesday and Thursday, August 2 and 3, during the show of the Yorkshire Agricultural Society in that City. The Committee announce that the Schedules are now ready, and may be obtained gratis by any Exhibitor, on application to Mr. R. W. NICHOLSON, Hon. Sec., Town Hall, Ripon. Prizes are offered to the amount of 102*l*. 10*s*. Specimens sent for competition from a distance will receive every care and attention.

HENRY MORTON, Mayor,
Chairman of the Committee.

NEW PLUMS.
HENRY DOWLING, FRUIT-GROWER, Woolston Lawn, Southampton, most respectfully begs to return his sincere thanks to the Nobility, Gentry, and Public generally, for the most liberal patronage he has received, and informs them that he has none of the Standard of England, but can supply good strong plants of the Angelina Burdett and Black Gage, which can be obtained at Mr. C. TURNER'S, Royal Nursery, Slough, or from the Grower. See the *Florist* for December, or *Gardeners' Chronicle* of November 5th or 12th for testimonials and particulars.

Woolston Lawn, March 11, 1854.

NEW TURNIP SEED.
TO THE TRADE.—NEW TURNIP SEED.—*The Subscribers having a few Bushels more than they require for their regular Trade, can offer the following varieties, grown by Farmers of the highest respectability, and warranted all* NEAT *as delivered by them.*

GREEN-TOP SCOTCH YELLOW TURNIP.
PURPLE-TOP ABERDEEN "
GREEN GLOBE "
WHITE GLOBE "

The have also a few hundred weight of the following Mangold Wurzel, &c., also saved by farmers:—

YELLOW GLOBE MANGOLD WURZEL.
LONG RED " "
RED GLOBE " "
WHITE BELGIAN CARROT. "

As the quantity is small, an early application is requested. Wholesale Catalogues can be had on application in exchange for one penny stamp.

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

"NORFOLK HERO" CUCUMBER.—Without exception the very best Cucumber for open ground cultivation that has yet been offered. It is a most prolific bearer, as handsome as any frame variety, and is as delicate in point of texture, the fruit measuring from 16 to 20 inches in length. It is in the sole possession of YOUELL & Co., who will forward per post free (on receipt of postage stamps) packets containing six Seeds, 1*s*.; 18 Seeds, 2*s*. 6*d*. "To Market Gardeners the above will be found a great acquisition."—Royal Nursery, Great Yarmouth.

GRASS SEEDS FOR PERMANENT PASTURE.
WHEELER AND SON'S DESCRIPTIVE LIST of GRASS SEEDS will be forwarded free on application.

J. C. WHEELER AND SON, GLOUCESTER.

A FIRST CLASS CATALOGUE OF GERANIUMS, VERBENAS, FUCHSIAS, DAHLIAS, HOLLYHOCKS, ETC.
GEO. SMITH begs to announce that the above is now ready and will be forwarded in exchange for one postage stamp.—Tollington Nursery, Hornsey Road, Islington.

LILIUM LANCIFOLIUM, PELARGONIUMS, RANUNCULUSES, ANEMONES, AND GLADIOLUS.
HENRY GROOM, Clapham Rise, near London, by Appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to say that his SPRING CATALOGUE is ready, and will be forwarded by post on application.

NEW DESCRIPTIVE PLANT CATALOGUE.
WM RUMLEY AND SONS beg to announce that their NEW DESCRIPTIVE SPRING CATALOGUE of new and choice Fuchsias, Verbenas, Geraniums, Cinerarias, Petunias, Chrysanthemums, Pansies, Hollyhocks, Dahlias, Stove, Greenhouse, Bedding, and Hardy Plants, at very reduced prices, is now ready, and may be had on application. For choice Fuchsias, Verbenas, Cinerarias, Pansies, &c., see our Advertisement in this Paper of March 11.

Gilling, near Richmond, Yorkshire.

RHODODENDRON COCCINEA SMITHI.
S. JOHNSON begs to say he has a fine Plant of the above named, in good condition, with above 100 blooms, 10 feet high, and fine foliage.—Maison Dieu Nursery, Dover.

PELARGONIUMS.
GEORGE CLARKE begs to offer 12 of the newest and best Pelargoniums for exhibition, in strong healthy plants, for 18*s*.; Fancy do. do., 15*s*. per doz., hampers included.

Streatham Place Nursery, Brixton Hill, Surrey.

CHOICE CALCEOLARIA SEED.
MESSRS. MANDER AND ADAMS having some choice CALCEOLARIA SEED from a well known amateur in the West of England, offers the same in packets of 1*s*. and 2*s*. 6*d*. each; by enclosing the amount in postage stamps, it will immediately be forwarded, post paid, to any part of the United Kingdom. Early orders are requested, as the stock is limited.—Address, Ranelagh Nursery, Leamington Spa, Warwick

FINE MANGOLD WURZEL SEED.
LONG RED MANGOLD WURZEL.—Fine new Seed, 10*d*. per lb., or 70*s*. per cwt.

JOHN SUTTON AND SONS, Seed Growers, Reading, having a large Stock of the above, are now selling it at the low price here quoted. LARGE YELLOW GLOBE and other sorts, as see Priced List, which may be had in return for two Postage Stamps.

GENUINE NEW WHITE AND RED CLOVER SEED, COW GRASS, *and the Alsike Hybrid Clover, can be obtained at the lowest market prices from*

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

NEW ALSIKE CLOVER, Price Ten Guineas per cwt., or in small quantities at 2*s*. per lb., may be had on application to Mr. H. RAYNBIRD, Basingstoke, Hants. Also New Home-grown ITALIAN RYE-GRASS, of good and genuine Stock, at 30*s*. to 35*s*. per quarter.

FLOUR BALL POTATOES, in quantities of not less than 10 pecks, at 2*s*. per peck. Early application should be made to WILLIAM BECKETT, Welham, Retford, Notts, as the stock is limited. Post-office orders, made payable at Retford, must accompany all orders.

SEED POTATOES.

EARLY SHAWS, per bushel	...	...	7*s*. 0*d*.
FORTYFOLDS, ditto	...	...	7 0
THOMPSON'S SEEDLINGS, a new and early stock, per bushel	...	...	8 0

Also a few sacks of the Kidneys on hand advertised last week, price 7*s*. per bushel. The whole of the above have been carefully selected, and are free from disease. Growers who wish to cultivate first-rate stocks ought to order without delay.

Address to JOSEPH WILSON, St. Helen's, Ipswich, Suffolk.

CAPITAL OLD AND NEW HAY.
TO BE SOLD, in one Lot, 77 loads of good MEADOW HAY, standing 4½ miles from the Stevenage Station on the Great Northern Railway, comprising part of a Rick of very fine Old Hay, containing 35 loads, a Rick of prime New Hay, got up without any wet, containing 22 loads, and another with but little wet on it, of 20 loads.

Apply to Mr. HUMBERT, Land Agent, Watford, Herts.

THE BLACK BARBAROSSA.
JOHN BUTCHER begs to state that a Certificate of Merit was awarded to this Grape at the Horticultural Society's Meeting on the 21st February, as a mark of its excellent qualities; one of which was stated to be that "it will hang longer in a ripe state without shrivelling than any other black Grape in cultivation."

Fine Fruiting Plants, 10*s*. 6*d*.; good plants, 5*s*. 6*d*., may be obtained of the above splendid Late Grape. London Agent, Messrs. DAWE, COTTRELL, & BENHAM, 36, Moorgate Street; and JOHN BUTCHER, Nurseryman, Stratford-on-Avon.

BEAUTIFUL NEW BEDDING PLANT.
MILLER'S HYBRID MULE PINK.

ROBERT MILLER, Hartshill, Nursery, Newcastle, Staffordshire, offers with confidence the above Pink, colour a bright crimson scarlet, double; grows from 9 to 15 inches high, branches out and forms a little bush, and flowers most abundantly from June to October. See *Gardeners' Chronicle*, Sept. 24, 1853.

DIANTHUS R. M., very pretty, and being dwarf in habit, it will doubtless make a good bedding plant. Price 12*s*. per doz., package included. The usual discount to the Trade. To be let out the second week in April. Post-office orders from unknown correspondents made payable at Newcastle.

"WELLINGTONIA GIGANTEA."
MESSRS. VEITCH, of EXETER and CHELSEA, have much pleasure in stating that their Seeds of the above magnificent Tree are vegetating satisfactorily. They therefore hope to be able to send out well established seedling plants during the ensuing summer and autumn. They are now taking orders for them at the following prices:—

For a Single Plant ...	2 guineas	For 8 Plants	... 10 guineas
For 4 Plants ...	... 6 guineas	For 12 Plants	... 12 guineas

And all orders will be executed strictly in the rotation in which they are received.—March 25.

WELLINGTONIA GIGANTEA.—Beautiful Lithographed Plates (from a drawing taken in California) of this wonderful Tree may be had, at 7*s*. 6*d*. each, of Messrs. VEITCH & SON, Exeter, and Mr. JAMES VEITCH, jun., Exotic Nursery, Chelsea.

The Bark, Wood, Cones and Foliage, which were exhibited on Tuesday week at 21, Regent Street, may be seen at the Exotic Nursery, Chelsea.—March 25.

NEW ROSES FOR 1854.
BENJAMIN R. CANT has now ready for sale, strong plants in pots of all the NEW ROSES, some of which have never before been offered to the public, descriptive Catalogues of which can be had on application.

St. John's Street Nursery, Colchester.

WILLIAM NICHOLSON still continues to send out very strong well-rooted Plants of his four new and distinct varieties of STRAWBERRIES, viz., AJAX, dessert Fruit; RUBY, ditto; CAPTAIN COOK, Market Fruit; FILL-BASKET, ditto, at 15*s*. per 100, or 25 each of any two sorts for 10*s*., box included. Post-office orders payable at Yarm, Yorkshire. For a full description, see Advertisement *Gardeners' Chronicle* Jan. 28, 1854.—Egglescliffe, near Yarm, Yorkshire.

MANGOLD WURZEL SEED.—PURCHASERS OF LARGE QUANTITIES *will be supplied liberally.*

For Prices, apply (stating quantity required) to JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

LARGE RED ALTRINGHAM CARROT, the most nutritive of all Carrots, and best for horse feed. Price 1*s*. 3*d*. per lb., for quantities of not less than 14 lbs.

JOHN SUTTON & SON, Seed Growers, Reading, Berks.

DOUBLE FRENCH MARIGOLD AND CAPE STOCK SEEDS. A packet of beautiful DOUBLE FRENCH MARIGOLD SEEDS forwarded on receipt of Seven Penny Postage Stamps. Ditto, SCARLET CAPE STOCK, ditto

EDWARD SANG & SONS, Nursery and Seedsmen, Kirkaldy, N.B.

PERMANENT PASTURE.
R. H. SMITHE, of Eastling, Faversham, Kent, is now prepared to send out his Mixtures of the NATURAL GRASSES, PERENNIAL CLOVERS, &c., to lay down Land to Permanent Pasture, at 25*s*. per acre, allowing 3 bushels to the acre, carriage free. Mixtures for Lawn, or any other purpose, or the sorts separate. Most of the species of Grass are collected by the Advertiser, and he will bestow the greatest attention in selecting such as shall constitute mixtures specifical to the soil, purpose, &c., of each buyer.

WHITE MULBERRY TREES,
EXPRESSLY CULTIVATED FOR THE REARING OF THE SILKWORM.

GEORGE BALCHIN is now sending out fine healthy White Mulberry Trees at the following low prices: 10*s*., 15*s*., 20*s*. and 25*s*. per 100. Also Silkworms' Eggs, of a superior quality, white and yellow, 1*s*. 6*d*. per 1000.

Orders containing Post Office order punctually attended to.

Address, JOHN RICHARD EVANS, Cork Street, Bond Street, London; or, GEORGE BALCHIN, Spring Place, Godalming, Surrey.

HOLLYHOCKS.
A. PAUL AND SON have now ready for Sale a very large and healthy stock of HOLLYHOCKS, suited to bloom well next autumn; Border Flowers, 4*s*., 6*s*., and 9*s*. per dozen; fine named kinds, 12*s*., 18*s*., 24*s*., and 30*s*. per dozen. A fresh supply of their new and unrivalled seedlings, which obtained first prizes at the leading exhibitions last year, and were never once beaten, will be sent out the end of the month, strong, healthy plants. A priced descriptive Catalogue free by post on application.

Recently published, free by post, price 1*s*., AN HOUR WITH THE HOLLYHOCK.

N.B. Post-office orders may be drawn on Waltham Cross or London.—Nurseries, Cheshunt, Herts.

CAPE HEATHS.
W. J. EPPS begs to call attention to his extensive and rare Collection of Heaths, which are in the finest condition possible; very bushy and well formed for specimens in 3, 4, and 6-inch pots, consisting of all the best varieties, such as Aristata ampullacea, tricolor, jasminiflora, ventricosa, Massoni, Webbiana, obbata, &c., &c., 12*s*., 18*s*., and 21*s*. per doz. A Collection of 100 varieties, 5*l*., carriage paid to London. A liberal allowance to the Trade, provided a quantity be taken. All the new and best kinds of Azaleas, Stove and Greenhouse Plants, Fuchsias, Dahlias, Verbenas, and Roses, equally moderate.

W. J. E. has about 200 young specimens of Heath, &c., to part with in 8, 11, and 20-inch pots. Also a Collection of very beautiful Orchids. Lists sent on application.

Nurseries, Maidstone and Ashford.

MAY'S PARAGON CABBAGE.
THE Subscriber, in offering the above for the first time, guarantees it to be the finest Cabbage in existence; of dwarf habit; has never been known to run; attains a large size (having been grown to the great weight of 28 lbs.); of a most beautiful green, and boils tender as Asparagus, which it continues to do throughout the season; in flavour is as far superior to the ordinary Cabbages of the day as they are to the old Drumhead Scotch. In ¼ oz. packets, 1*s*. each, free by post. The usual allowance to the trade.

H. M. begs to inform the public that he is unable to supply any more of his MAGNUM BONUM LETTUCE, as the stock was only small and is completely sold out.

Address all orders and communications to HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

BASS AND BROWN'S SEED AND PLANT LIST

free by post for three penny stamps.

COLLECTIONS OF VEGETABLE SEEDS, comprising the best in cultivation, including several new sorts of first-rate quality, 3*l*., 2*l*., 25*s*., and 15*s*.

☞ Goods CARRIAGE FREE with orders of 20*s*. and upwards to London, Ipswich, Norwich, or any Station on the Line.

Remittances are requested with orders from unknown correspondents. Post-office Orders to be made payable to BASS & BROWN, or to STEPHEN BROWN.—The Autumn and Spring Catalogues supplied free by post for three penny stamps each, the cost of which may be deducted from orders sent.

BASS & BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk. ESTABLISHED ABOUT HALF A CENTURY.

EDWARD GEORGE HENDERSON AND SON, of

the Wellington Nursery, St. John's Wood, London, are now prepared to take orders for any of the undermentioned, which will be sent out in the course of the present season, due notice of which will be given.

BEDDING CALCEOLARIAS.

"Matchless," magnificent crimson, 7*s*. 6*d*.

"Loveliness," yellow cap and ground, with crimson blotch in the centre, 7*s*. 6*d*.

"Surprise," bright orange crimson, good form, 7*s*. 6*d*.

"Masterpiece," deep maroon scarlet, 7*s*. 6*d*.

"Superba," very dwarf plum, 7*s*. 6*d*.; the set for 31*s*. 6*d*.

The entire stock of the above is in our possession; they were exhibited at Chiswick in June last by Mr. Constantine; they are all of robust, compact habit, with large flowers and profuse bloomers.

FUCHSIA "MONARCH," as a show flower, stands pre-eminent; the flowers are of a fine stout substance with sepals of great width; colour scarlet, with a magnificent expanded corolla of a light blue violet, and the exceedingly fine texture of the corolla will render this a gem of the season; habit and growth fine and robust; 10*s*. 6*d*.

GERANIUM "SILVER QUEEN."—Clear white with dark cherry spot in the upper petals; good form, free flowerer, fine and distinct for exhibition, and one of the most useful for other purposes; the entire stock was purchased of J. H. Horsey, Esq., Taunton; 7*s*. 6*d*.

FANCY GERANIUM, "THE FORNARINA."—Very novel; ground colour blush with dark puce blotch in the upper petals, and lower petals spotted with the same colour; 10*s*. 6*d*.

FANCY GERANIUM, "BONNIE LASSIE."—Bright crimson ground colour with white centre, and all the petals distinctly margined with clear white; 15*s*.

FANCY GERANIUM, "LOVELINESS."—Upper petals bright crimson shading off to violet towards the centre, beautifully margined with pure white; lower petals clear white strikingly spotted with crimson; 10*s*. 6*d*. The last two varieties were figured in Turner's "Florist" for 1853.

GERANIUM, "PRETTY POLLY."—An extraordinary, novel and distinct new bedding variety; it received a certificate at the National Floricultural Society, and was exhibited by Mr. Keynes, of Salisbury, from whom we purchased the entire stock; 10*s*. 6*d*.

We shall also be prepared to offer the three undermentioned distinct Bedding Geraniums; viz: Quercifolium eximium, 7*s*. 6*d*.: Etoile de Vaise, 3*s*. 6*d*.; Picturata, 3*s*. 6*d*. A full description of the above Bedding Geraniums will be published hereafter.

March 25.

MESSRS. YOUELL AND CO.

BEG TO OFFER THE FOLLOWING:—

ERICA VENTRICOSA SUPERBA, bushy plants, in 48s and 60s, finely set with flower-buds. We particularly recommend these to the trade, at 60*s*. and 75*s*. per 100.

ERICAS.—Fine bushy blooming plants, in large 48s, of the following sorts, at 12*s*. per dozen varieties, viz.:—*Aggregata, Bowei, *Coventryana, *Cavendishi, colorans, *densa, *daphnoidea, echiflora, *exsurgens coccinea, *hyacinthoides, *Linnæoides nova, lævis alba, mirabilis, mammosa, metulæflora bicolor, *nigrita, *ovata, pyriformis, perspicua nana, *rubens, rubra calyx, trossula, transparens nova, Westcoti, *Wilmorea superba, Walkeri, viridiflora, *ventricosa breviflora, *v. Bothwelli, *v. coruscans, v. carnea, v. dependens coccinea, *v. fasciculata rosea, *v. f. longiflora, *v. f. superba, *v. hirsuta, *v. perspicuoides, *v. superba, *v. tenuiflora, *v. tumida.

ERICAS, in small and large 60s, nice bushy plants, many of them set for flower. All the above named marked with an asterisk, as well as the following, at 9*s*. per dozen varieties, viz.:—Denticulata moschata, elata, hyemalis, hybrida, scabriuscula, Sindryana, trossula rubra, umbellata, verticillata, ventricosa, cintra rubra, v. densa carnea, gracilis.

EPACRIS HYACINTHIFLORA, by far the best of the campanulata varieties, in strong plants, 1*s*. 6*d*. each.

EPACRIS.—The following choice varieties, in 48s, well set for bloom, at 12*s*. per doz. varieties, viz.:—Ardentissima, Atleeana, campanulata alba, c. grandiflora, c. maxima, Copelandica, carnea, coruscans, densiflora incarnata, elegantissima, formosa, grandiflora, impressa, imp. alba, imp. magna, lineatus magnifica, miniata, nivalis, onosmæflora, pulchella major, purpurescens, sanguinea, Tauntoniensis, the Bride, variabilis.

Abelia uniflora, small, 12*s*. per dozen.

Abutilon insigne, Linden's fine new species, 2*s*. 6*d*. each.

Aphelexis humilis and superbum, strong bushy plants, in large 48s, well set for flower, 12*s*. per dozen.

Burchellia capensis nana. This fine old favourite, 12*s*. per dozen.

CAMELLIAS.—The well known difficulty of inducing the greater part of the choice varieties to bloom in a young state, tempts us to offer the following, in stout plants, without buds, at 21*s*. per dozen, viz.:—Beali, Monarch, Juliana, Bruceana, Forbesi, Grand Frederic, Ruckeri, Lombardi, Horsfalli, Lefeveriana, Picturata, Lepidata, Fimbriata rubra, Agnesi, Sieboldi, &c.

Cassia corymbosa, a good winter-flowering plant, in 48s, 9*s*. p. doz.

Ceanothus rigidus and dentatus, in large 60s, 12*s*. per dozen.

CALCEOLARIAS—Crimson King (Henderson), deep crimson, very dark and rich, and does not fade; habit dwarf and robust, flowers large, and shape good.

" Magnificent (Henderson), rich crimson, with yellow crown; a large, fine-formed, and very splendid flower, quite distinct from anything yet out.

" Gold Chain, fine golden yellow, of great substance and fine habit, with very stout foot-stalks.

" Gold Cap (Garraway), rich dark maroon, the upper division of the flower deep gold colour, the flowers large and of fine compact habit.

These handsome varieties will be found the gems of the season, for bedding; strong plants, 2*s*. 6*d*. each, or 24*s*. per dozen.

CINERARIAS, the choicest of the new varieties; strong flowering plants, in 48s, 12*s*. per dozen.

Corræa speciosa, major, bicolor, and Cooperi; strong flowering plants, 12*s*. per dozen.

Daphne collina, 12*s*. per dozen; Dauphine, 18*s*. per dozen.

Deutzia gracilis, small, 9*s*. per dozen.

Diosma ericoides and capitata, nice bushy plants of these sweetly-scented species, 9*s*. per dozen.

Eutaxia myrtifolia, strong bushy plants of this fine old favourite, in large 48s, 9*s*. per dozen; floribunda, in 60s, 9*s*. per dozen.

FUCHSIAS: choicest of the new kinds, including Glory (Banks), England's Glory, King Charming, Dr. Lindley, Duchess of Lancaster, Incomparable, &c., 21*s*. per dozen.

Fairy Roses, 9*s*. per dozen.

Kennedya monophylla, 1*s*.; ovata alba, 2*s*. 6*d*.; and rubicunda maxima, 1*s*. 6*d*.

Mandevilla suaveolens. This is certainly one of the finest greenhouse creepers we possess, producing large bunches of pure white and sweetly-scented flowers through the summer and autumn. It is of robust habit and rapid growth; 12*s*. per dozen.

Mitraria coccinea. This fine shrub has stood through the winter in the open ground in our nursery with very slight protection; its magnificent orange-scarlet flowers are produced in abundance in June and July. It stands unrivalled as a greenhouse or conservatory plant, and will no doubt thrive in most places out of doors against a wall. Strong flowering plants, 2 feet, 3*s*. 6*d*. each; smaller, 1*s*. 6*d*. each.

Mimulus variegata. This very beautiful variety produces large white flowers, handsomely spotted with rich crimson, 1*s*. each.

Mimulus, 6 handsomest varieties, including the foregoing, for 4*s*. 6*d*. the set.

Olea fragrans, 24*s*. per dozen.

Passiflora racemosa cærulea, in large 48s, 12*s*. p. doz.; Bellotti, fine new peach-coloured variety, 1*s*. 6*d*. each; Buonaparti, 1*s*. 6*d*. each.

Pittosporum tobirum, this fine old favourite, 1*s*. 6*d*. each.

Sollya Drummondi, strong, 1*s*. 6*d*. each; heterophylla, 12*s*. per dozen; linearis, 12*s*. per dozen.

Swainsonia Osborniana, new, 12*s*. per dozen.

Tecoma australis, 1*s*. 6*d*. each; jasminoides, 12*s*. per dozen; rosea, 1*s*. 6*d*. each.

Tetratheca ericæfolia, small, 18*s*. per dozen.

Geranium Flower of the Day, 6*s*. and 9*s*. per dozen.

" Crimson Ivy-leaf; this fine variety, sent out by Messrs. Standish & Noble, 5*s*. each (splendid for bedding).

HARDY SHRUBS.

Berberis Darwini, 12*s*. p. doz.; very strong and bushy, 3*s*. 6*d*. each.

" dulcis, strong, 4*s*. per dozen.

Cerasus illicifolia, a new hardy evergreen Cherry from California, producing purple fruit, 3*s*. 6*d*. each.

HARDY SHRUBS.

Chimonanthus fragrans, blooming at Christmas; its campanulate flowers fragrant as the Jonquil; strong plants, 12*s*. per dozen.

Clematis azurea grandiflora, strong, 12*s*. to 15*s*. per dozen; Sieboldi, strong, 12*s*. to 15*s*. per dozen; Montana, strong, 12*s*. per dozen; flammula, or sweet scented, in pots, 9*s*.

Escallonia macrantha; strong plants of this most charming evergreen flowering shrub, 12*s*. per dozen.

Eunonymus fimbriatus, strong plants of this handsome evergreen, 2*s*. 6*d*. each; japonicus fol. variegatus, 9*s*. per dozen.

Ilex castanifolia, strong, 3*s*. 6*d*. each; Cunninghami, 3*s*. 6*d*. each; latifolia, strong, 1*s*. 6*d*. to 3*s*. 6*d*. each; Sheppardi, fine, strong, 1*s*. 6*d*. each.

Lardizabala biternata, a fine hardy evergreen creeper, 5*s*. each.

Ligustrum ovalifolium, new species, 12*s*. per dozen.

Passiflora cærulea, strong, 9*s*. to 12*s*. per dozen.

Quercus Fordi, 2 to 3 feet, 24*s*. per dozen; Ilex Humei, 2 to 3 feet, 30*s*. per dozen; ballota, 2*s*. 6*d*. each; rotundifolia, 2*s*. 6*d*. each.

ROSES.—"Queen Victoria" (Paul's), standard and half standard, 2*s*. 6*d*. each; "Prince Albert," strong, in pots, 5*s*. each.

Wistaria sinensis, strong, 12*s*. to 24*s*. per dozen.

Weigela rosea, strong bushes, 2 to 3 feet, 9*s*. per dozen.

Yucca gloriosa superba, strong, 3*s*. 6*d*. to 5*s*. each.

CHOICE HOLLYHOCKS, PANSIES, AND OTHER HERBACEOUS PLANTS, BULBS, ETC.

HOLLYHOCKS.—The following fine varieties, in strong plants, well established in pots, 12*s*. per dozen varieties:—Commander-in-Chief, Delicata, Fireball, Formosa Improved, Lilac Perfection, Magnum Bonum, Maiden's Blush, Mr. Charles Baron, Mulberry Superb, Obscura, Princess Royal, Rosea rubra, Venosa rubra, Walden Gem, &c.

PANSIES.—The following choice kinds, at 10*s*. per dozen varieties:—Alba Superba, Androcles, Blanche, Cæsar, Calysto, Caroline, Commander-in-Chief, Crystal Palace, Drusilla, Duchess of Rutland, Elegant, Emma, Euphemia, Glory, Helen, Heroine, Indian Chief, Isabella, Junius, Lady Carrington, Lady Franklin, Lady Harding, Lord Jeffery, Marchioness of Lothian, Masterpice, Miriam, Miss Talbot, Mrs. Beck, Penelope, Polyphema, Post Captain, Prince Arthur, Princess, Queen of England, Rubens, Sambo, Smolensko, The Rajah, Uttoxeter Hero, Viceroy, Yellow Prince.

Pentstemon speciosum. This fine old species, in strong plants, 18*s*. per dozen.

Delphinium Mooreanum. This little known variety, raised in this neighbourhood, is undoubtedly a very fine and distinct plant, and worthy to be ranked with Barlowi and Grandiflorum; its colour is somewhat intermediate between the two. Strong plants, 1*s*. 6*d*. each.

Delphinium Barlowi, fine, 9*s*. per dozen.

Daisies, new Belgian, in 50 fine varieties, 4*s*. per dozen.

Dielytra spectabilis, 9*s*. per dozen.

Funkia grandiflora, 2*s*. 6*d*. each.

Rockets, double white, 3*s*. per dozen; purple, 4*s*. per dozen; crimson, 1*s*. 6*d*. each.

Oxalis rosea, one of our prettiest hardy herbaceous plants, and nearly always in flower, 6*s*. per dozen.

Pæonies, herbaceous, in 25 fine varieties, 12*s*. per dozen.

Phloxes, in numerous fine varieties, 9*s*. to 12*s*. per dozen.

Potentilla M'Nabiana, and other choice kinds, 6*s*. per dozen.

Primrose, double white, 4*s*. per dozen; double yellow, 4*s*. per dozen; double purple, 4*s*. per dozen; double lilac, 3*s*. per dozen; double crimson, 12*s*. per dozen.

Silene maritima plena, fine double white, 9*s*. per dozen.

Statice latifolia, strong, 9*s*. per dozen; pseudo armeria, 6*s*. per dozen; maritima rosea, very pretty and distinct, 6*s*. per dozen.

Choice selection of Herbaceous Plants, 25*s*. per 100.

Lilium colchicum may be described as a yellow L. lancifolium, as it resembles this fine species in shape of flower; strong bulbs, 7*s*. 6*d*. each; L. lancifolium album, flowering bulbs, 9*s*. per dozen; L. rubrum, flowering bulbs, 18*s*. per dozen.

Lily of the Valley, strong roots, 5*s*. per 100.

CHRYSANTHEMUMS, comprising the very best of the new kinds of large flowering and Pompon varieties, in strong plants, 6*s*. to 9*s*. per dozen.

TREE CARNATIONS, of the choicest kinds, by name, 18*s*. per dozen.

CARNATIONS AND PICOTEES.—Beautiful selections from their superb and extensive collections, at 18*s*., 24*s*., and 30*s*. per dozen pairs; fine mixed, for borders, 9*s*. per dozen pairs. True Old Clove Carnation, 12*s*. per dozen pairs.

PINKS.—Extra fine sorts by name, 9*s*. to 12*s*. per dozen pairs.

CHOICE FRUITS. (WARRANTED TRUE TO NAME.)

"FASTOLFF RASPBERRY."—It is with much satisfaction that we announce a third award made by the London Horticultural Society, on 26th of July last, for examples of the above most excellent Raspberry, unequalled by any other variety in size, fruit, and richness of flavour.

It is reported in the *Gardeners' Chronicle* of July 30th, page 486, as follows:—"Messrs. Youell, of Great Yarmouth, sent a boxful of beautiful fruit of the Fastolff Raspberry; they were unusually fine, and well deserved the certificate of merit awarded them."

Strong well-rooted canes, 15*s*. per 100.

OLD YELLOW ANTWERP RASPBERRY. This splendid fruit, unequalled for the dessert, has become almost extinct, and in its place a worthless variety substituted; we possess a fine stock of strong canes, and offer them at 24*s*. per 100.

New Monthly Fruiting, 24*s*. per 100.

RHUBARB, Myatt's Victoria, 9*s*. per dozen; Royal Albert, 9*s*. per do.; Linnæus, 9*s*. per do.; Tobolsk, 6*s*. per do. (strong).

SEAKALE, strong, 2 years, 6*s*. per 100.

ASPARAGUS, extra strong, 3 years old, 3*s*. 6*d*.; 2 years old, 2*s*. 6*d*. per 100.

☞ Less quantities than those named above supplied at the same prices. Orders of 2*l*. and upwards are delivered Carriage Free to London or Hull, or to any Railway Station within 150 miles of the Nursery. Catalogues will be forwarded free on application.

ANEMONE SEED, saved from selected roots, 10*s*. per lb. The usual discount to the trade.

YOUELL & CO., ROYAL NURSERY, GREAT YARMOUTH.

EDWARD GEORGE HENDERSON AND SON,

Wellington Nursery, St. John's Wood, London, beg to recommend the following (for description see this Paper of the 4th of March):—

GLOXINIA DUKE OF WELLINGTON	7*s*.	6*d*.
" LADY FRANKLIN	7	6
" LEONIE VAN HOUTTE, ... 5*s*. and	7	6
ACHIMENES CHERITA, beautiful new sp., 5*s*. and	10	6
" SIR TRECHERNE THOMAS, splendid ... ... 3*s*. 6*d*. and	5	0

Any or all the above forwarded free by post.

In May the following 12 new Verbenas, raised by Messrs. Banks, Stewart, and Fozard, will be ready for sending out at 42*s*. the set, viz., Orion, Robin Hood, Marie Antoinette, Matchless, Beauty, Madonna, Attraction, Diadem, Ne Plus Ultra, Ariosto, Beauty of the Garden, and Sulphur Model. For the descriptions see this Paper of the 11th of March.

Seed Catalogue forwarded post free, containing a description of the best known new Annuals, excluding the new Californian and other varieties that have not sufficient merits for our recommendation.—March 25.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN,

&c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidence, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introduced by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant bloomer; and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21*s*.

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gaufred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes. Each 21*s*.

GERANIUMS.

BASS AND BROWN

Having this season a very large stock of GERANIUMS, are enabled to offer the following of strong and very fine plants, in 4-inch pots, ready for immediate re-potting, which will yield an abundant bloom. For Descriptive List, see Autumn Catalogue.

BEST NEW VARIETIES OF LAST SEASON.

Leonie Van Houtte, beautiful rose, with a pure white throat, very distinct and handsome	5	0
Princess de Lambelle, a fine variety, figured in the "Flora" of L. Van Houtte	3	6
Wilsoni, pre-eminently majestic above all others, figured in the "Floricultural Cabinet," July, 1853	5	0

Any 12 of the following fine varieties for 25*s.*, with one plant in addition of Achimenes Marie Van Houtte, our selection, 12*s.* to 20*s.* per dozen.

Alba grandiflora	Fyfiana	La Perouse	Marginata	Priestleyana	Tricolor
Argyrostigma	General Baudraud	Labiata	Mrs. Addanson	Pulcherrima	Victoria Regina
Carminata splendens	Grandis	Leopold 1st	Passinghami	Spectabilis	Wortleyana
Frederick Lenning	Hogoveen	Marie Van Houtte	Petoiana		

Descriptions see Spring Catalogue.

ACHIMENES.

CHERITA, fine ultra-marine blue, shaded with red, magnificent	3*s.* 6*d.*
LOUIS VAN HOUTTE, rich rosy purple, white centre	2 6
MR. APARPAIT, beautiful carmine purple	2 6
SIR TRECHERNE THOMAS, beautiful rosy carmine, very rich	2 6

The following 12 beautiful varieties for 10*s.* (Descriptions, see Spring Catalogue.)

Boeckmani [cærulea	Hilli (or Kewensis)	Kewensis vera	Magnifica purpurea	Multiflora	Fimbriata
Beuchmania hirsuta	Hirsuta cærulea	Longiflora alba	Margaretta	Ghiesbreghtii	Coccinea grandiflora

A FEW NEW PLANTS.

Æschynanthus splendidus	each	2*s.*	6*d.*	to	5*s.*	0*d.*	Gastrolobium Drummondi	each	7*s.*	6*d.*
Æchmea fulgens		5	0	to	7	6	Gesnera purpurea macrantha	2*s.*	6*d.*	to 3 6

The Autumn and Spring Catalogues free by post for three penny stamps each.

Goods Carriage Free (not under 20*s.*) to all the London termini, and all Stations on the London and Norwich Colchester line. Plants added gratis with orders of 40*s.* and upwards.

Post-office Orders payable to Bass and Brown, or Stephen Brown, Sudbury Post-office.

SEED & HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

THE FINEST BALSAMS IN EUROPE, in Six Classes; Seed saved by Mr. Glenny from flowers three inches across: the six, 37 stamps; Mixed Seeds, 13 stamps, in Sealed Packets only, signed and sealed. The finest seeds that can be had procured to order, and all other choice Horticultural subjects.—420, Strand.

FLOWER SEEDS.—We have selected out of our large collection of Flower Seeds the most beautiful and showy varieties, each sort distinct in colour, and calculated to produce a fine effect when planted out in beds or groups in the flower border; and we have had each variety distinctly marked with its Botanical and English name, height, time of flowering, colour of the flower, manner of growing, whether erect or trailing, &c., the time it should be sown, and other valuable hints as to its cultivation. In selecting these varieties, we have been careful to exclude all which are shy bloomers, or have an insignificant appearance, so that the collections will comprise only those which are really showy and handsome, and which we believe would prove to the entire satisfaction of any lady or gentleman who might be disposed to order them. The German Stocks and Asters especially are most superb. The Collections will be sent free by post to any part of the kingdom at the following prices:—

Twenty extra fine varieties, all distinct and beautiful, 5*s.*
Fifty ditto ditto 10*s.* 6*d.*

Payment can be made either by Postage Stamps or Post Office Order, made payable to J. C. Wheeler & Son, Nurserymen, Gloucester.

NEW AND CHOICE FLOWER SEEDS.

ASTERS, new French Pæony-flowered, very fine
„ „ „ Pyramidale, splendid
„ German Globe, quilled and striped, 12 vars. mixed
POPPY, new Pæony-flowered. 8 vars. mixed
STOCKS, German 10 week, 12 vars. mixed, fine
„ „ intermediate, 12 vars. mixed
„ „ new large flowering, 6 vars. mixed

Abronia umbellata	Hollyhock, from named flowers
Arctotis breviscapa, fine	Indian Pink, new white striped
Calceolaria, very fine	Leptosiphon luteus, new yellow
Calandrinia umbellata	Linum grandiflorum rubrum
Calliopsis coronata, fine	Lythrum roseum, new, fine
Cenia turbinata flava	Lindheimeria texana, new, fine
Centauridium Drummondi	Pansy, very superior
Cineraria, very superior	Perilla arguta
Collinsia bartsiæfolia	„ nankinensis
„ multicolor	Saponaria calabrica
Convolvulus minor, fl. pleno	Schizanthus lilacinus
Cyperus glomeratus	Silene atro-rosea
Dianthus Gardneri, fine	Tropæolum Scheurmannianum
Gymnopsis uniseralis	Wallflower, German, double

CHARLES ALEXANDER, Seedsman and Florist, 32, West Register Street, Edinburgh.

CARRIAGE FREE.

SUTTON'S GRASS SEEDS.—Extract of a Letter from Dr. Lindley:—

"Messrs. Sutton,—*We have already made a trial of your Lawn Grass Seeds, and it is but justice to say they have proved the best we have sown for many years.*

(*Signed*) "John Lindley.

"*Horticultural Society*, 21, *Regent Street, London, Nov.* 9, 1853."

Messrs. Sutton are continually receiving similar letters of commendation of their Lawn Grass Seeds. Price of seed, 1*s.* 3*d.* per lb., 3*s.* per gallon, or 21*s.* per bushel, carriage free, except very small quantities. The quantity required is 40 lbs. per acre, in forming new lawns, or from 10 to 20 lbs. per acre for improving old lawns.

GRASS SEEDS FOR PERMANENT PASTURE.

Gentlemen intending to lay down Land to Permanent Pasture, or for two or three years' lay, are recommended to communicate with us, stating the nature of the soil and situation, that we may advise as to sorts of Grass Seeds most suitable. Price 20*s.* to 30*s.* per acre.

IMPROVEMENT OF GRASS LANDS.

SUTTON'S RENOVATING GRASS SEEDS FOR IMPROVING OLD PASTURES.—Many Old Upland Pastures Parks, and Meadows, are nearly destitute of Clovers and the finer and more nutritious sorts of Grasses, in which case we are in the practice of furnishing such sorts only as are wanting.

The following is similar to many other letters received from former purchasers:—

From D. T. Cunynghame, Esq., Wellesbourne, Warwick, November, 1852.

"The meadows that were renovated with your Seeds are looking very well. I cut nearly two tons of hay to the acre, and three years ago the same land hardly produced half a ton per acre. The Garden Seeds I have had from you exceed by far any that I have bought elsewhere."

Quantity of Seed required, 8 *lbs. to* 12 *lbs. per acre. Price* 1*s. per lb.*, Carriage Free.—Address

John Sutton & Sons, Seed Growers, Reading, Berks.

N.B.—We have a very fine Stock of Mangold Wurzel and Carrot Seed; also of good Clover Seed, at very moderate prices. Priced Lists will be sent post-free.

PAGE AND CO.'S

BLIGHT COMPOSITION should be in the hands of all Plant and Fruit Cultivators. 4*s.* per gallon, sufficient to make four. For testimonials see back leaf *Gardeners' Chronicle*, March 11, 1854.

GARDEN AND AGRICULTURAL SEEDS, first quality, and lowest market price.

Oxford Street (adjoining Radley's Hotel, 20 yards from the Railway and Docks), Southampton.

H. BIGLAND and Co., in returning their best thanks for the liberal support they have received during the twelve years they have been in business, beg to state that they have disposed of their SEED BUSINESS to Mr. T. F. WINSTANLEY, whom they confidently recommend to their friends, and respectfully solicit for him a continuance of the kind support they have received.

H. B. & Co. will carry on the NURSERY BUSINESS as usual until the stock is disposed of, to effect which, as quickly as possible (their lease having nearly expired) they are prepared to treat with customers on the most liberal terms, and respectfully invite an inspection of their stock at the Nursery Grounds, Whalley Range, where all letters to them should in future be addressed.

T. F. WINSTANLEY, in succeeding to the SEED BUSINESS of Messrs. H. Bigland & Co., begs to assure his friends and the public that no exertions shall be wanting, on his part, to keep up the well-earned name of the late firm for supplying their customers with the best and truest Seeds that can be procured, and hope, by strict attention to business, to merit a continuance of the support they have hitherto enjoyed.

Seed Warehouse, 28, Market Place, Manchester.

GEORGE BAKER begs to say that his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, CONIFERS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES, &c., may be had by enclosing two postage stamps.

G. B. wishes to call particular attention to his fine Stock of GREEN and WEEPING HOLLIES, from 1 to 12 feet high.

G. B. has supplied the American Exhibition in the Royal Botanic Gardens, Regent's Park, from its commencement.

American Nursery, Windlesham, near Bagshot, Surrey, about six miles from Staines Station, Windsor Branch, South-Western Railway, where conveyances may be obtained.

FINE GRASS SEEDS FOR ORNAMENTAL PARKS, LAWNS, &c., *where a fine sward is required*, 1*s.* 3*d. per lb.*, 3*s. per gallon, and* 20*s. per bushel. Our mixtures for this purpose have given the greatest satisfaction.*

William E. Rendle & Co., Seed Merchants, Plymouth.

The Gardeners' Chronicle.

SATURDAY, MARCH 25, 1854.

The small market value of soft-wooded Trees is such as to render them scarcely worth attention among planters, except under very peculiar circumstances. When Willows, or Limes, or Poplars, or Sycamores, or any such species are felled, they are in so little demand, that after a small quantity of the best has been taken for the turner, toyman, or butcher, the rest may go as firewood. There is now, however, some prospect of their coming into consumption on a very large scale in an unexpected manner, for which, if anticipations are realised, we shall have to thank the Great Exhibition of 1851.

It appears that at a late meeting of the French Society for the Encouragement of National Industry, a paper was read explaining how such wood may be converted into paper. The bark is taken off, and the wood is reduced into shavings; the shavings are then cut very thin; they are next placed in water for six or eight days, dried, and afterwards reduced to the finest powder possible by a corn mill. This powder is mixed with rags, which serve to prepare the pulp of paper, and the ordinary operation of paper making is proceeded with. All white woods, such as the Poplar, the Lime, and the Willow, are suitable for the purpose, but the discoverer ascribes a good deal of his success to the quality of the water he employed—that of the little river Doller, which

runs near Mulhausen. For the first experiment he employed the wood of the Aspen. Specimens of the paper so obtained were laid before the meeting, but we are not informed of its quality.

No doubt can exist that wood may be made into paper, provided it can be reduced into threads or particles fine enough for the purpose. For what is Flax or Hemp except wood, whose fibres are readily separable? There is no difference between the wood of Hemp and of Willow, or other soft trees, than such as arises from the greater cohesiveness of the threads of the latter, or from greater toughness, which is not a difference of importance in paper-making, for the weakest wood in the world is stronger than cotton dross, now so largely used in all paper-mills. The only question is, can the cohesiveness of the fibres be overcome, or does the substance produced by grinding into pulp, either when used alone or mixed with other pulp, present a material fit for paper? We apprehend that it does.

The Mulhausen experiment is reported to have been made with timber. Suppose that the newly cut branches of Poplars, Limes, and Willows had been macerated for a fortnight, cut into suitable lengths, and then put into a tearing (not grinding) mill, where they could be worked with water, we suspect that good pulp (or at least "half stuff") would have been obtained without a preliminary reduction of the wood into shavings, and an after process of grinding.

That the present enormous demand for paper will lead to the discovery of some new source of fibre is certain. In fact it has already resulted in the manufacture of paper from straw, both here and in the United States, and a very good article, though not of a high class, is thus obtained. Our West Indian colonies indeed might keep our market amply supplied, with no small profit to themselves; but they do so little except cry for aid to HERCULES, and wring in despair their feeble hands, that we expect nothing from them unless the British Government will take taxes in kind, and allow the inhabitants to pay their imposts with trusses of dry Plantain stems; if indeed it should prove that West Indians would not also, in such an event, expect Government officers to reap and pack their Plantains for them.

It appears from a return just issued by the Board of Inland Revenue that, notwithstanding the excise duty on paper, the quantity of that substance manufactured in the United Kingdom has risen from 150,903,543 lbs. in 1851, to 177,633,009 lbs. in 1853, showing an increase of manufacture to the extent of nearly 27 millions of pounds weight in three years. In 1844, the gross receipt for paper duties amounted to 709,320*l.*, and in 1853 to 1,049,662*l.*; showing an increase of about 340,000*l.* in the course of nine years. But of that increase above 190,000*l.* apply to the last five years, or about 38,000*l.* a year, representing, we believe, an annual increase of raw material exceeding six millions of pounds weight.

Let us ask whence these six million pounds annually added to the wants of the paper market are to be supplied. Materials are already becoming scarce; the price of paper is rising, and must continue to advance unless an enormous quantity of matter convertible into paper is furnished to the manufacturers. The effect will be something much worse than even an excise duty; the cost of books, newspapers, and everything else made of paper must inevitably be enhanced, and a natural permanent tax upon knowledge, as it is the fashion to call the paper duties, will be added to whatever artificial tax the financial necessities of the country may call for.

The remedy probably lies at our doors; it is certainly within our reach. Fibrous plants not strong enough for linen, but amply sufficient for paper, may be brought into profitable cultivation; as, for instance, the Hemp Nettle (*Urtica cannabina*), the Marsh Mallow, or even common Mallows, and the Hemp Mallow (*Lavatera cannabina*), to all which our climate is perfectly adapted. In the meanwhile, without awaiting the issue of experiments with such plants, our paper makers and country gentlemen would do well to ascertain what can be made of their soft woods.

FREQUENTLY as we have called the attention of our readers to the subject of the VINE MILDEW, we should be guilty of an unpardonable omission if we did not direct their notice to the very remarkable pamphlet of M. BOUCHARDAT, which was originally published in the memoirs of the Imperial Central Agricultural Society of France, but which is now to be had in a separate form.* Its excellence does not consist in any new or brilliant discoveries, but in the patience with which the disease has been watched, and materials collected for its study, whether historical or physical. The collection of Vines in the Luxembourg Gardens is beyond all doubt the most extensive in the world, comprising above 4000 individuals from every country where the Vine is cultivated, arranged under 2050 numbers, consisting either of distinct varieties or sub-varieties, or coming from distinct and different localities. Every plant in this collection was examined during the prevalence of the Vine mildew, and a table drawn up, showing in what degree every separately numbered variety was affected. With the exception of the American Grapes, scarcely one escaped, and not all of these; and, unfortunately, in the majority of instances the Vines of inferior quality were those which escaped the most completely, though a few of those which supply the best wines of Bordeaux and the Gironde, as the Carmenet, the Cots, and Sauvignons, have been only slightly attacked. The value of such a list, faithfully drawn up, is incontestibly of the highest importance to all who have extensive interests in the cultivation of the Vine, and the more so because it seems quite certain that the malady spreads the most readily where a variety of different sorts are cultivated in the same Vineyard. Even the American Vines and the European varieties, known under the name of Cots, become at last infested when in company with other varieties which suffer extensively. It is also quite certain that Vines which are kept low and propagated by layering are far less subject to attack than those which are trained on trellises; and it is probable that the best method of improving those trellised Vines which have suffered seriously is at once to bring them down to the surface of the soil, and to encourage the growth of new shoots from the depressed stems. It appears, also, that the time of pruning is by no means a matter of indifference, and that far greater impunity is secured by spring than by autumn pruning.

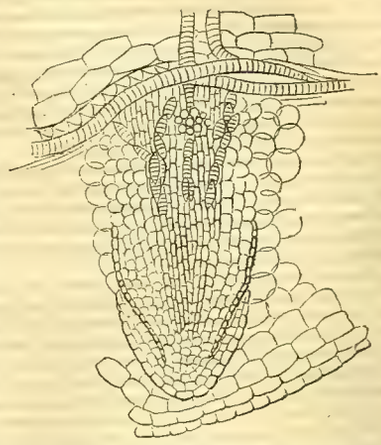
Two other chapters are very valuable, the one because it contains an account of almost every plan which has been adopted to alleviate the malady, the other because of the long and very complete list which it affords of the works which have appeared on the subject, or even bear upon it, from the earliest times far into 1853; nor is it merely a dry list of titles, but affords in many cases interesting notices of the contents of the respective books or pamphlets themselves.

The great mass of evidence, and the opinions of a large portion of those who have examined the subject scientifically and practically, is in favour of what is called the fungal theory; and, perhaps, in consequence of the truth of that theory being so much more palpable than in the earlier Potato murrain; and the efforts, therefore, directed to a particular end, so much more success has attended remedial attempts than in the other malady first mentioned. So much is this the case, that were it not for the almost unconquerable prejudices of the Vine-grower, there seems every reason to believe that the malady, should its ravages be unhappily continued, would be, to a very great extent, under the control of the cultivator. *M. J. B.*

IT is almost impossible to say anything new about the POTATO DISEASE; nevertheless, a communication, which we have just received from Mr. J. HENDERSON, A.L.S., the well-known gardener of the Earl of FITZWILLIAM, at Wentworth, is not without interest. It has generally been supposed that when the murrain is developed in forced Potatoes, there is no indication of the presence of the peculiar parasite which is so indicative of the malady. Such, however, cannot be said in the present instance; for not only is the under-side of the leaves covered with patches of the mould, exactly as in the usual autumnal form, but the brown spots on the stem are equally frosted with the *Botrytis*, as are also the walls of its internal cavity, from which the threads are seen protruding in every direction, and having perfect fruit, exactly as in the cavity of the fruit of Tomatoes. Mr. HENDERSON informs us that the disease has appeared in a more destructive form than he had ever before seen it at Wentworth—nearly all the plants in one frame being completely blighted, while it has already begun to show itself in another. There is a very general expectation that the severity of the late winter will prove destructive to this malady, and the no less disastrous disease of the Vine; unhappily, the case just reported shows that the spores of the *Botrytis infestans*, at least, are as active as ever, and forbids us to hope that these fearful visitations have at present entirely vanished. *M. J. B.*

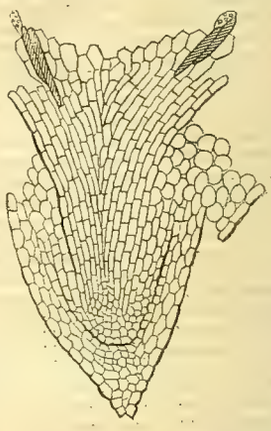
VEGETABLE PATHOLOGY.—No. XII.

46. Roots, whether normal or adventitious, in their earliest stage of growth consist of a little convex body, composed of apparently homogeneous cells resting upon the bast cells, and more or less distinctly converging to the apex. The outer cells at the apex however, soon, become distinct or separated from the rest of the mass all round, so as to form a little close-fitting or loose cap attached



A vertical section of a young adventitious root in Tradescantia, showing the spongy tip (pileorhize) ready to burst through the bark. The cuticle of the root is perfectly distinct from the pileorhize, and the central tissue is seen communicating with the vascular tissue, both vertical and horizontal.

only in the centre. The whole gradually forces its way through the bark, either turning aside the tissue or absorbing it, so as ultimately to become free, the spongy cap still adhering and forming the principal, or at least the most permanent part by which the moisture of the soil is imbibed from the earth. In those cases where



A vertical section of the tip of a young adventitious root of the common Nettle just emerged from the bark. The pileorhize is quite distinct from the subjacent tissue, and that again from the central cone which communicates with the vascular tissue lower down. Both after Trécul.

it is more permanent the outer cells, as they are worn out, are gradually replaced by new tissue formed within.

47. The adventitious or air roots in Orchids have a very different structure from those of ordinary plants, as their office is partially different. The outer cells, as observed by Vriese, contain spiral threads; and, like other vascular tissue, though peculiarly active when young, soon lose their protoplasm and contain air only. It is probable, therefore, that while the young external tissue is gifted with superior powers of absorption, the older tissue keeps up a constant communication by gaseous penetration between the air and the more central tissue. Schleiden asserts that this layer of spiral cells is external to the true epidermis; but such does not seem to be the case in the species which I have examined, nor does it appear very clearly how such a structure is possible. The true roots when present are usually covered with delicate hairs.*

48. As the moisture is imbibed principally by the tips of the roots, which supply the constant waste due to evaporation, as well as what is deposited in the shape of

---

* "Traité de la Maladie de la Vigne." By M. BOUCHARDAT. 8vo. Paris, 1853. BOUCHARD-HUZARD.

* The structure varies considerably in the air roots of different species. While in some eight or more layers of cells containing copious spiral threads, of which the outermost is horizontal and the rest vertical, are succeeded by numerous strata of beautifully reticulated cells, of which the outermost contain grains of chlorophyll, and these by a central bundle of bast cells, dotted ducts, and straight spiral vessels; in other cases the strata of cells containing spiral threads are at once succeeded by regular hexagonal tissue. A third modification, in which all the spiral cells are horizontal, is represented in this Journal, 1852, p. 229. The tips of the air roots are green, while the rest is externally of a silvery white. A section through the tip shows that there is a true spongelet or pileorhize, while every gradation from ordinary parenchymatous tissue containing cytoblasts, to spiral and reticulated cells, or both, as the case may be, is traceable upwards. The pileorhize is external to the outer layer of horizontal cells, which must therefore by analogy be the true epidermis. The air roots therefore differ in nothing from ordinary adventitious roots save in the ultimate structure of the outer cells, which keep up a communication between the surrounding atmosphere, while the green tips are capable of absorbing any moisture which may adhere to the substance to which the plants are attached. Air roots of a similar structure occur in Pothos and some other genera, but not apparently so constantly as in some Orchids; at least, in Pothos violacea I have found no such structure.

new tissue, or laid up as nutriment in the old, it is at once evident that the vigour of a transplanted tree must be much impaired if the delicate fibres and their tips are injured, or are suffered to become dry, and that any very considerable destruction of the smaller fibres must be prejudicial to luxuriant health, though it may have a tendency to produce other beneficial ends, which depend upon a less vigorous growth of the shoots and foliage.

49. Roots increase in length at their tips only, which, by reason of their delicate and compressible tissue, are capable of penetrating into the narrowest crevice wherever moisture is to be found, by which circumstance the health of trees is maintained in long continued drought. It is in consequence of this property and capability of increase in the direction of moisture, that draining pipes are often blocked up by fibres, even where the utmost pains are taken to make the joints impervious.

50. As the young roots are in immediate connection with the alburnum, from which their central tissue is directly derived, and the spongy mass rests upon the tip of the bast cone, it is evident that the moisture imbibed by the roots is at once conveyed to the very part where the upward current is most active.

51. Though buds are often produced from the base of adventitious roots, where the roots themselves have decayed for want of the necessary moisture and medium for their full development, and they both spring immediately from the vascular tissue, there is no evidence to show that buds and roots are essentially and originally the same organ, and only modified by accidental circumstances. The casual origin of both is equally obscure, but it is at least certain that in the majority of instances roots will not flourish long without a superior bud, though the roots of Dahlias, which will grow for years without the formation of a single bud, are a remarkable exception to this law. Adventitious roots are in some cases almost normal, but moisture and obscurity have great influence in their production. Damp moss, for instance, kept round a branch will often favour their development, and the occurrence of adventitious roots in the Fig and other trees when surrounded by the list by which they are attached to the wall, is a familiar instance, as is also their occurrence in climbing plants, for the most part, on the side turned away from the light and adherent to the matrix. Again, as adventitious buds occur where a greater quantity of nutriment is stored up than is necessary for the supply of the normal buds, or where the whole mass of normal buds has been destroyed, so adventitious roots are generated under similar circumstances, as is also the case where the descending current of elaborated sap is cut off, either by actual division, as in a cutting, or where a portion of the bark is removed by ringing. It is rare that roots are produced in an ascending direction; but we have already more than once alluded to such a circumstance (see No. 28), and the adventitious roots of the Yellow Lily, according to Trécul, are in their origin ascending. In the greater number of instances the direction of roots, whether normal or adventitious, is at first horizontal with reference to the axis to which they belong. *M. J. B.*

CONOCLINIUM IANTHEMUM.

The fine foliage, excellent habit, and large loose spreading heads of light blue flowers, which terminate every shoot of this plant, make it exceedingly attractive; and its season of blooming, winter and early spring, when blue flowers are scarce, merits for it a place in every collection of plants.

This is an excellent time for commencing its culture, as a good specimen of it may be grown in the course of the summer. When received it should be placed in a close pit or house, keeping it near the glass, and as soon as it has got over the effects of travelling shift it into a pot two sizes larger than that in which it has been growing. For soil use good rich turfy loam, fibry peat, and well decayed leaf soil in about equal proportions, adding a sufficient quantity of clean sharp sand to ensure perfect drainage, and a small quantity of thoroughly decayed cow manure may also be added with advantage. Be careful to have the ball and soil in a nice moist healthy state when the plant is shifted, and place it in a close moist warm situation, to avoid the necessity of giving much water at the root until free growth shall have commenced. Sprinkle the plant morning and evening with the syringe, and maintain a humid atmosphere; also keep it as near the glass as is convenient, in order to induce a vigorous start. When it is evident that the roots have taken hold of the fresh soil, stop the shoots, and tie them out, so as to induce the lower buds to push, in order to obtain a well-furnished foundation. Continue to afford the plant a humid atmosphere, sprinkling it frequently overhead with a fine-rosed syringe, but regulate the temperature so as to secure strong close-jointed shoots. If all goes on well, a second shift will be required towards the middle or end of May, and this should not be deferred until the roots get matted, or the plant sustains any check for want of pot room. There will be no danger in giving a large shift now, but beginners will be safer to give only a moderate one, for there is some danger of erring in watering a plant, when it is surrounded by a large body of loose soil, and therefore it is better to give two moderate shifts. Attend to keeping the shoots nicely tied out, in order to admit light and air to the foliage, and to secure a compact sturdy habit of growth.

During summer the plant, if in vigorous health, may be removed to a cold pit or frame, which can be kept close and moist. But the very best position for securing rapid strong growth would be a pit where a bottom-heat of 80° or 85° could be maintained, and where the plant could be kept near the glass, keeping the atmosphere rather cool, and affording it a slight shade for a few hours on the forenoons of very bright days. Here it would grow very rapidly, and a frame and a little fermenting material properly put together might be easily made to afford a gentle bottom-heat for two or three months, and would be useful for many plants besides this. Attend during the growing season to keeping the shoots nicely tied out, stopping them as may be necessary, and also to shifting as may be required. Stopping, however, should not be practised later in the season than will allow of getting the last growth well ripened before winter; and if the shoots are kept properly tied out, and the plant well managed otherwise, very little stopping will be necessary to secure compact bushy specimens. When damp cloudy weather occurs in autumn, the plant should be removed to a rather dry atmosphere, where the temperature may average about 55°, placing it near the glass, and it should be rather sparingly supplied with water for a few weeks, in order to get the wood well ripened, which will greatly conduce to a fine display of bloom. By removing the plant to a warmer situation, and giving a liberal supply of water at the root, it will soon develope its beauty, and may be placed in the conservatory while in flower. Care must be observed, however, not to place it in the way of cold draughts, and a damp stagnant atmosphere must be guarded against, as this would soon destroy the blossom, and greatly impair the beauty of the plant.

If afforded a close dry situation, the flowers will remain some two months in perfection, and will present a striking and agreeable contrast with those of most winter blooming plants. After the flowering, the plant may be cut back rather closely, and removed to a cool dry situation for a few weeks, keeping it sparingly supplied with water until it shows indications of growth; when it should be repotted, slightly reducing the old ball, and clearing away a portion of the old exhausted soil. The same treatment as recommended above may be repeated, and will produce an immense specimen in course of the second season. Cuttings selected of firm bits of the young wood, and treated in the ordinary way, will root very freely in bottom heat. But the plant will bear cutting back and disrooting to any extent; so that when once a stock is obtained, there will be little necessity for propagating it. *Alpha.*

Home Correspondence.

Coniferous Wood.—You make me out to be rather more determined a sceptic than I really am; I certainly have some doubts as to whether the Deodar will become generally valuable as a timber tree in England, but I must also disclaim wishing to make out any case against it. I wrote under the conviction that some persons who read the glowing account of its value, both as a timber and a plantation tree, might be led to act in what I should think a very hasty manner, and really plant it extensively in the place of trees of known value; for I think I remember having heard last year of something like a ton or two of seed being imported for the purpose of planting parts of the royal forests with them. If I wished to make out a case at all, it was, I think, rather my object to make out a better character for the Cedar of Lebanon, both at home and in Syria, than it generally gets. On this latter point I should be glad to know whether any of your correspondents know the character of the common soft English grown Cedar of Lebanon wood, as respects its power of resisting worms? I have several times seen it used in furniture (for insides of drawers, and such purposes); it has a good deal of scent when first cut up, but this goes off in a few years. I can only say I have never seen it worm eaten, but I do not think I have seen it when it has been much exposed to their attacks. Altogether my impression is that the Deodar will probably turn out to be a superior wood to the common Cedar, but yet not very different in character; that it will grow very rapidly, and produce wood which will be soft, pleasant to work, and with a sweet scent, but not of much strength when young; that grown on rocky ground, in a climate similar to its native climate, and to a great age, it might probably produce wood nearly equal to the finest Indian specimens. I fully concur in almost all that you say respecting the value of evidence of the quality of any tree in its native country, and the character of the climate in which it grows; still there is an infinite variety of soil, situation, and climate, by all of which the growth and quality of timber (especially I believe of the Pine tribe) is affected. Perhaps the wood of Pinus insignis may not turn out wholly worthless; a bit of English grown Weymouth Pine (P. strobus), at 11 years old would look like very poor stuff, yet I have used wood of old trees (though they do not appear to thrive well in England) nearly as good as American White Pine. I am afraid that I shall not be able to find a specimen of the wood of this or of the Hackmatack at present. It is some years since any trees of either have been cut down at Boynton (where they grow), and I am afraid all the wood has been used up. If any more should be cut down I will take care that good specimens of the wood are preserved. I have no doubt I can get a fair specimen of the other American Larch (the Red Larch), which is more plentiful there than the Hackmatack, and seems to thrive better. What you say of the extreme difference of climate between England and the Eastern parts of America is perfectly true, and it certainly is naturally to be expected that the trees from there would not thrive in England. Yet some of them do thrive, and produce valuable wood, nevertheless; for instance, some of the Hickories, and the black and white Walnut. There are some small tables at Boynton made of English grown black Walnut. The heart-wood is handsome and durable, yet different in look from American specimens of the same, which may perhaps arise from the greater age of the latter. All I wish to insist upon in the remarks I now make, or have before made, is the extreme uncertainty of the results of planting any particular tree in any particular place until it has actually been tried. I do not think that I know of a stronger instance than that I before mentioned, if I am correct in supposing that Memel timber, Petersburgh and Archangel deal, and the several widely different qualities of British grown Scotch Fir timber, are all the produce of the same kind of tree; at the same time I fully acknowledge the great value and interest of any evidence on the subject, such as specimens of the wood, and accounts of the climate and situation in which trees thrive, which are hardy and ornamental in England. And I think what you say of the Laricio will justify me in planting it more than I have done, as it certainly is a very quick growing and handsome tree. My remarks have reached a great length, but I hope that you will not think the space they occupy wholly wasted if they should help to turn the attention of any one concerned in such matters, to the intricate, but at the same time most interesting and important subject of the external causes which influence the quality of any particular kind of timber. *C. W. Strickland, Hildenley.*

Radishes.—In answer to Messrs. Rendle's inquiry, as to the species of Radish grown at Constantinople, and described as so large and so excellent in flavour, I beg to state I am unable exactly to solve his query; but I know that much finer and better Radishes are produced from French seed than from that ripened in our own country. Some Turnip-Radish seed was once given me that was brought from Amiens, which produced roots at least double the diameter of any I ever saw grown from English seed. But the Radishes grown the next year from the seed of these superior roots in no way differed from the ordinary English Turnip-Radish. It is fair to presume then, I think, that this climate is incapable of bringing the vegetable to full perfection. In these days of easy communication it would be worth the while to procure French seed. Is it not also very possible that Onion Seed ripened in Egypt or Portugal would be far superior to our own? *Sigma.* [Half the Turnip Radish and Spanish Onion seed sold in England is ripened on the Continent.]

Bees.—Your unsuccessful correspondent ("Somerset," p.134), cannot too quickly clear away the dead bees lying on the floor boards of his hive; the smell from the dead bodies of so many of the insects is very injurious to the survivors. The fine weather we have lately had, has most probably, by this time, dried the bottom of the hive, wetted when it was blown down; if, however, his hive has the means of ventilation at the top, the ventilator or other orifice had better be opened. You must also have immediate recourse to feeding, as we fear that want of food rather than damp has been the chief cause of the death of so many of your bees. Such a wretched bee-season as the last has, perhaps, never been known. *W.*

Manetti Rose Stock.—I have cultivated this stock these 10 years on a portion of my nursery ground, consisting of about 3 acres of light poor soil resting on a subsoil of gravel. The better part of it is light sandy loam; I find the Manetti to suit me much better than the Dog Rose for dwarf plants; nearly all the Hybrid Perpetuals and Bourbons take freely upon it, and make fine heads. Some specimen plants have stood seven or eight years, and are now full of health, while, if they had been worked on the Dog Rose, or upon their own roots, they would not have remained healthy above two or three years, having nothing to feed upon but light dry soil. Rose growers, who are fortunately situated on a rich soapy loam, or on a deep loam, or who possess a deep vegetable soil with a cool moist bottom, doubtless find the Dog Rose suit them best. And these are the cultivators whom I have generally heard condemn the Manetti stock. I believe, however, that in most other soils and situations the Manetti is preferable, and it will be highly prized by those who have to contend with light, dry, or poor soils, on which this stock will flourish, when the Dog Rose would scarcely live. A few Roses will not grow well upon it, such as Cloth of Gold, Solfaterre, Ophirie, &c., but as a set-off, it will be found that Robin Hood, Madame Aimée, Hypocrate, Œillet parfait, Superb Shaped, Unique, &c., grow much more robust on it than they do on the Dog Rose, and they produce finer flowers. *R. B. Bircham, Hedenham Rosery, Bungay, Suffolk.*

Khasia Orchids.—Dr. Hooker, in his travels in the Khasia mountains, mentions Eria, Cœlogyne (Wallichi, maculata, and elata), Cymbidium, Dendrobium, Sunipia, and other beautiful air plants, as growing at the top of the Kolleng rock, flowering profusely; and though freely exposed to the sun and wind, dews and frosts, rains and droughts, they were all fresh, bright green, and strong, under very different treatment from that which they are exposed to in the damp, unhealthy, steamy Orchid houses of our English gardens. Vol. ii, 294. "Vanda cærulea grows in profusion, waving its panicles of azure flowers in the wind. As this beautiful Orchid is at present attracting great attention, from its high price, beauty, and difficulty of culture, I shall point out how totally at variance with its native habits is the

cultivation thought necessary for it in England* The dry Grassy hills which it inhabits are elevated 3000 to 4000 feet; the trees are small, gnarled, and very sparingly leafy, so that the Vanda which grows on their limbs is fully exposed to sun, rain, and wind. There is no moss or lichen on the branches with the Vanda, whose roots sprawl over the rough bark. The atmosphere is, on the whole, humid, and extremely so during the rains; but there is no damp heat or stagnation of the air, and at the flowering season the temperature ranges between 60° and 80°; there is much sunshine, and both air and bark are dry during the day; in July and August, during the rains, the temperature is a little higher than above, but in winter it falls much lower, and hoar-frost forms on the ground. Now this winter's cold, summer's heat, and autumn's drought, and above all, the constant free exposure to fresh air and the winds of heaven, are what, of all things, we avoid exposing our Orchids to in England. It is under these conditions, however, that all the finer Indian Orchideæ grow, of which we found Dendrobium Farmeri, Dalhousianum, Devonianum, &c., with Vanda cærulea; whilst the most beautiful species of Cœlogyne, Cymbidium, Bolbophyllum and Cypripedium inhabit cool climates, at elevations above 4000 feet in Khasia, and as high as 6000 to 7000 in Sikkim."—*Dodman.*

Cedar Wood of the Ancients.—In a late Number (see pp. 148-9), were two interesting articles on the Cedar of the ancients compared with the Cedar of Lebanon and the Deodar. It is most probable that the Cedar of Lebanon and of Atlas was formerly rather more than less diffused than it is at present, and therefore very improbable that it should have been unknown to the ancients, who were more familiar with its habitats than we are. No mention is made in these articles of the Juniperus drupacea, generally understood to become a tree in Syria; nor to Callitris quadrivalvis, which is certainly a tree in Barbary. Either of these may be the ancient Cedar, and the latter, which is as fragrant as the Cypress, is a very fine wood. The Oxycedrus of botanists, and its ally, or variety, macrocarpa, is sometimes a large bush, more often a small one, in the most favourable climate. The common Cypress (upright) is frequently called, in Greece and Italy, the male Cypress; the horizontal is, for distinction, called the female—a popular notion unconnected with botany. Whether Juniperus phœnicea and lycia be identical or not, that which passes for the former in southern Europe grows rapidly into an upright, straight tree, resembling the horizontal Cypress. I know three such in this country, nearly 25 years old, from seed, about 20 feet high, flowering and ripening fruit annually. *S.*

Hartley's Rough Plate Glass (see p. 165).—Mr. Rivers has no doubt forgotten the circumstance, but the rough plate glass he used in "1850," was not purchased of us, but of another London house. After our former letter, we have thought it might be as well to explain this to you, as we have also done to Mr. Rivers. *Jas. Phillips and Co., Bishopsgate Street Without.* [Mr. Rivers has requested us to correct the unintentional error complained of. He states that the glass of inferior manufacture referred to was not purchased of Messrs. Phillips.]

New Arrangement of Plants under Glass.—This being, *par excellence*, the age of cheap glass, allow me to offer a few remarks as to the desirability of a reform in our plant structures. I think it high time that our old-fashioned greenhouses, &c., with their trim stages and shelves for pots, *à la amphithéatre*, were consigned "to the tomb of all the Capulets;" for the artificial appearance of the interior of such houses, with their rows of artistically arranged specimens, is anything but agreeable to the eye of taste, how perfect soever the occupants may be as specimens of good cultivation. Why not banish our present artificial system and approximate more to a natural style of arrangement? As a case in point, I may quote Storch's account of the winter garden at the Palace of Taurida, in St. Petersburgh:—"The walks of this garden meander amidst flowery hedges and fruit-bearing shrubs winding over little hills, producing at every step fresh occasions for surprise. The genial warmth, the fragrance and brilliant colours of the nobler plants, and the voluptuous stillness which reigns in this enchanting spot, lull the fancy into sweet romantic dreams; we imagine ourselves in the blooming groves of Italy." He describes the pillars of the roof as disguised in the form of Palm trees, also concealed flues, &c. I do not of course introduce this instance as a model; but how infinitely superior would it not be to have the beautiful plants of other climes growing naturally at their ease as they would in their native habitats, than to have them supported by the stakes and ties which at present disfigure even our finest specimens of plant cultivation. What delightful promenades would not such houses afford compared with the distorted lines of pottery ware, now misnomered collections of plants, with their every branch pegged or tied up, the very personifications of formality. I think it very probable that the time will come when we shall have geometrical flower gardens laid out under glass, filled *en masse* with the beautiful free-flowering greenhouse plants, at present seen only in pots; for we have plenty of beautiful things extremely eligible for this style of cultivation. It may, however, be urged that the transferance of the geometrical garden under glass, is still but another phase of formal gardening; and, indeed, in introducing the idea of massing greenhouse plants, I certainly do not speak exclusively for the adoption of that style, but only as an original idea worthy of being carried out. Groups of some of our showy plants, well disposed, would have a very imposing appearance, on the same principle that the different kinds of forest trees are grouped by themselves in park scenery. The fountain I hold to be another essential feature in ornamental plant-houses, whatever be the form of that noble adjunct, which offers innumerable varieties for the landscape gardener to exercise his taste upon; its neighbourhood affords a very eligible site for exotic Ferns, interspersed it may be with the flowering plants which ornament the rocks of milder climes. *Gulielmus, Alderwasley.* [A pleasant dream—but a mere dream.]

Management of Young Plantations.—Foresters should pay great attention to young trees for the first two or three years after they have been planted, in order to keep them clear of rough Grass, Gorse, &c.; they may even be required to go over them as often as twice a year, depending on the nature of the soil for the growth of such annoyances. When young plantations are not so attended to, the rough Grasses completely overtop the trees, decay, and fall upon them, preventing free access of air, and of course their young growths are retarded as they otherwise would not be. Every one is aware of the forester's pest—the rabbits—which if not kept down prove very destructive to young woods. Last year I had to replant the whole of a strip which had been cleared of its crop (Oak and Larch) by these vermin. It is to be regretted that they prevail to such an extent everywhere. Last harvest a farmer in this neighbourhood had his crop on one field so completely destroyed by rabbits that he "let it alone." No particular time can be specified as to when a plantation of Oak and Larch should first be thinned, that must be regulated by the soil and locality; if these be favourable the trees will progress rapidly, and if otherwise the contrary must be expected; generally, however, the first thinning is required in about nine years. Indications of the necessity of performing the operation will be apparent, owing to the trees becoming close, their branches meeting and intertwining; and then is the forester's busy and careful time. I say careful because great caution is necessary to be observed; for the trees having stood rather close for a time, any undue exposure might injure them. If the Oaks are to be kept as the permanent crop, the Larch in after years should be gradually removed, giving the former all possible freedom, both among themselves and the nurses, and regularity is a great point to be secured, both as regards the health of the trees, and in order that the wind may not be permitted to play too roughly upon them. I have seen many trees blown down from inattention to regularity. In the blue-books are to be found examples of thinning in the royal forests. In some cases that operation has been delayed for a period of 20 years, and will the public believe it in others until the trees had become nearly matured! Did the surveyors contemplate a great demand for fishing-rods and whip-handles? It would certainly appear so. But what could be expected of men who had never studied their profession? For your remark is perfectly true, that "forest management is a very difficult art; it demands long experience, great acquaintance with trees and their nature, and a perfect familiarity with all that influences the rate of growth of timber." *W. B. A.*

Rhododendron anthopogon.—It may interest some of your readers to know that the plant which has borne the above name for no less than 34 years, and whose title to be considered peculiarly an Indian mountain plant has, I believe, never hitherto been challenged, proves to be the Osmothamnus fragrans, DC., of Siberia and the Altai. This, under the name of Azalea, was discovered 100 years ago, and described and figured by Gmelin, in 1769, in his "Flora Sibirica." Subsequently it has been published, also with a plate, by Pallas, as Azalea lapponica, in his "Flora Rossica," published 1784; and still more recently by Adams, in the "Transactions of St. Petersburgh Academy," as Azalea fragrans, also with a figure. The second Siberian species, O. pallidus, does not seem even a variety of the above, for the flowers change colour, from yellow in bud to pink, and are white in age. As Rhododendron anthopogon this same plant has been carefully examined and described no less than 10 times—by Don twice, by Royle (with a plate), by Loudon in his "Arboretum" (figured), by Graham ("The Edinburgh Phil. Journal"); in the "Botanical Magazine" (t. 3947), in De Candolle's "Prodromus," and twice by myself. I have dwelt at length on these facts, for the sake of the illustration it affords of the backward state of the flora of India. I need not say that I take to myself more blame than belongs to all my predecessors put together, both because I professed to have made the genus Rhododendron an especial study, and because excellent authentic specimens of Osmothamnus, from various Russian botanists, are in the Hookerian Herbarium, and are wholly undistinguishable from Himalayan ones. Had I possessed such a general acquaintance with Ericeæ as is necessary to the proper elucidation of any of its genera, this would not have happened; as it is, I was led astray by the character attributed to Osmothamnus, of a four-celled ovary, which is not constant, if indeed true, and R. anthopogon varies with 4—6 cells. I may also add that the figures of Gmelin and Pallas are not recognisable. The above is one instance out of many occurring daily to Dr. Thomson and myself, in our studies of the Indian flora, of the involved state of systematic botany, and of the necessity of taking widely different views of the number of known species of plants to what obtain in most scientific works. *J. D. Hooker.*

America as a Field for Gardeners.—Since this subject began to be agitated in your columns, I have learned that two or three young men in this neighbourhood have resolved to cross the Atlantic in the course of a few weeks. It is likely enough that some elsewhere have also determined on going to America, and the probability is, that many are halting between two opinions. I have sought information on the subject from parties in this country and others in America, as in my opinion it is a very important matter, for there are hundreds and thousands of gardeners in this country who must, in the nature of things, meet with disappointment here, have their hopes blasted, and spend their days on earth in penury and toil. The market is over-stocked. A gentleman who lately advertised for a person to manage his garden and ground, informed a correspondent of mine, that he was "for many days literally overwhelmed with applications." A friend and brother gardener of mine, holding a first-rate situation in Scotland, and much respected for his moral worth and professional attainments, informs me that most of the young gardeners who left this place for America had considerable experience—some of course better qualified than others; but the best places have not uniformly fallen into the hands of the best men, which not unfrequently happens in this country, as well as in America. In the Northern States, the average rate of wages may be about 70*l.* or 80*l.* a year, with board in some cases, in others, house, fuel, and perquisites. In the Southern States, the wages are much higher, but in summer the climate is unhealthy there. In general, however, much money has been realised by those only who have embarked in business as nurserymen, florists, or market gardeners. One man who left me in 1839 was landed at New York with only 1*s.* in his pocket; was employed there, and soon got a situation in the south, where he saved money enough to enable him to start or open a seed and general store in Charlestown. When he visited this country some five or six years ago, he told me that he could then retire from business with 700*l.* a year to live on. My friend, Mr. ——, florist, New York (one of the first who left this for America), is now carrying on a profitable trade there. His heart, however, appears to be in Scotland, for, in a letter I had very recently from him he says that he has a great desire to spend the evening of his days in this country, and that he could afford to buy a piece of ground large enough to build a house upon, make a garden, keep a cow, and have at least 150*l.* a year to live on. He mentions, however, that young people only should go to America, as those advanced in life rarely like it, while young folks are likely to become acclimatised, and, as I suppose, "yankeeised." I could make other extracts of an encouraging nature from this letter from Scotland; but I hasten to notice the cases of two of my wife's brothers, who were ploughmen or farm servants in Holderness, in Yorkshire, before they went to America. Of course they knew nothing more of gardening than other farm men, but they both got situations as gardeners on their arrival in America. John, the eldest, crossed the Atlantic 12 or 14 years ago. He kept his first situation 2 or 3 years, and then he left it for a better at Enfield, Hartford county, where he had a great number of men under him. As soon as he could count over 1000 dollars of his own, he left his situation and went to the town of Urbana, in the state of Ohio; there he commenced the nursery business, and is succeeding well. His younger brother, David, went to America in 1852, and engaged himself as a gardener to a gentleman at Urbana for 7 dollars a week; but whether he had board or not, I cannot say. Unfortunately for David his sweetheart left England the same year, and went to the state of Illinois. Well, at the termination of his twelvemonths engagement, he gave up his situation, in order to go to Illinois; but he found considerable difficulty in getting away, as his employer was most anxious for him to remain. On the 14th of last month he wrote to us from Paris, Edgar county, where he is now working on a farm. His wages are 15 dollars a month, with board and washing. "But," he adds "I think I shall not work at farming after this winter, unless it be for myself, as I can get more wages at gardening, which is much prettier work. Take one thing with another I like America much better than England, as the people here are not proud; and it is a man's principle, not his money, that makes him a gentleman." As my letter is much swelled by these extracts, I shall reserve my "comments and counsels," till another occasion. *A. Pettigrew, Woodside Gardens.*

Societies.

HORTICULTURAL, *March* 21.—Dr. Henderson in the chair. Sir J. Davis, Bart., T. F. Baily, Esq., G. E. Frere, Esq., and Dr. Madden were elected Fellows. A paper on the cultivation of Hyacinths in glasses, by the Rev. W. B. Hawkins, was read, as were also some remarks by Mr. John Edwards, on the Fluke Potato, a seedling from the Lapstone, which it was stated to excel in general good qualities; and it was also reported never to have been affected by the disease.—Mr. Gaines, of

* We collected seven men's loads of this superb plant for the Royal Gardens, at Kew, but owing to unavoidable accidents and difficulties, few specimens reached England alive. A gentleman who sent his gardener with us to be shown the locality, was more successful; he sent one man's load to England on commission, and though it arrived in a very poor state, it sold for 300*l.*, the individual plants fetching prices varying from 3*l.* to 10*l.* Had all arrived alive, they would have cleared 1000*l.* An active collector, with the facilities I possessed, might easily clear from 2000*l.* to 3000*l.*, in one season, by the sale of Khasia Orchids.

Battersea, received a Knightian Medal for a Rhododendron, named Princess Alice, in the form of a tree some 10 feet high, profusely ornamented with fine heads of white flowers delicately suffused with pink, each floret being prettily spotted in the upper petal with minute brown dots. The same exhibitor also furnished a young plant of the tender orange-blossomed Rhododendron javanicum, for which a Certificate of Merit was awarded, and a well-flowered Azalea, "Mont Blanc." —From Messrs. Veitch came a cut specimen of Rhododendron with a compact head of white flowers richly spotted with brown. It was named R. picturatum superbum, and appeared to be a hybrid from R. maximum crossed with arboreum. — Messrs. Lee sent a boxful of beautiful Camellia blossoms, and five plants of Camellias in pots, among which the most strikingly beautiful was certainly De la Reine, a well-formed, good sized, white flower, with a tinge of creamy yellow in the centre. The most marketable plant perhaps, however, was Wilderi, which appeared to be a most profuse bloomer. A Banksian Medal was awarded.— Camellia formosa from Messrs. Chandler, stated to be a seedling from Waratah, arrived too late for competition. — Messrs. Rollisson contributed the Indian Dendrobium Farmeri, the rhubarb-scented D. macrophyllum, and another species, together with three kinds of Lycaste, a similar number of Vandas, all referable to V. suavis ; two handsome forms of Cattleya Harrisoniæ, one of which passes on the continent under the name of amethystina ; the charming Barkeria elegans, the column of which bears a striking resemblance to the head of some animal; a pale variety of Sobralia macrantha ; the singularly formed Masdevallia Wageneriana and Philodendron Simsi—an Arum-like plant, whose beauty consists rather in the large handsome foliage and flower-spathe than in the blossoms which it conceals. A Knightian Medal was awarded. — From C. B. Warner, Esq., came a handsome, high-coloured, slender-growing Dendrobium very nearly related to nobile, for which a Certificate of Merit was awarded. — Messrs. Henderson furnished Acacia celastrifolia, in the shape of a little tree covered with blossoms ; Eriostemon scabrum, nicely grown and flowered ; the charming pink Boronia triphylla, a basketful of pretty little flowering plants of the hardy Sikkim Rhododendron ciliatum, the brilliant orange-scarlet Æschynanthus speciosus, and one or two other plants. A Knightian Medal was awarded.—From Mr. Brown, gr. to F. Parnell, Esq., came three pots of Keens' Seedling Strawberry, and also a dish of the same variety. A Certificate of Merit was awarded for those in pots. — Much better coloured Keens' Seedling Strawberries not in pots were exhibited by Mr. Higgs, gr. to Mrs. Barchard, for which a Certificate was awarded.—Of foreign Salad Vegetables, Mr. Lewis Solomon, of Covent Garden, sent a beautiful contribution, consisting of excellent Lettuces, Endive, Turnip Radishes, Blanched Chicory or Barbe de Capucin of the French, Tarragon, and Chervil. A Banksian Medal was awarded.—Among miscellaneous subjects of exhibition was a block of Larch from the Right. Hon. T. F. Kennedy's estate, near Maybole, in Scotland. It was a section of a tree about 2 feet in diameter, and was produced to show how different from American Larch or Hackmatack British-grown wood of this kind is. A piece of American Larch was placed beside it, for the purpose of comparison. Specimens of the timber of our two English kinds of Oak (Quercus pedunculata and Q. sessiliflora) and of Spanish Chestnut, were furnished by the Vice-Secretary, in order to exhibit the difference that exists between the woods of the pedunculate and sessile-flowered kinds and Chestnut, for which the timber of the last-named Oak, when found in old buildings, has always been mistaken. It was, however, proved by bits of wood from Westminster Abbey that the timber in the roof of that building is not Chestnut, as is still by many believed, but sessile-flowered Oak, which, although softer, more pliable, and easily worked, was stated to be in some respects quite equal to the common pedunculate kind.—From the Garden of the Society came Deutzia gracilis, the double-flowered white Prunus sinensis, a very ornamental shrub, requiring about the same treatment as the Deutzia; Dielytra spectabilis, and other plants, together with the following salad vegetables, which were good for the present season, viz. :—Laitue Romaine verte Maraîchere, and Laitue Chou de Naples, the former a green Cos, the latter a Cabbage Lettuce, both from cold frames, which were covered on several nights with frigi domo ; Scarole à fleur blanche, Oseille de Belleville, French Sorrel, and Broad-leaved Sorrel, Curled Chervil, Normandy Cress, and the two kinds of Lamb Lettuce, or Corn Salad, called by the French Mâche d'Italie, and Mâche ronde. Concerning the Lettuces, it should be stated that they had been watered occasionally with manure water.

Royal Institution, *March* 17. — Dr. Stephen H. Ward delivered a lecture on this occasion, on "Wardian Cases," of which the following is an abridged report. Dr. Ward began by explaining the circumstances which had led his father to adopt air-tight cases for the accommodation of his London window plants. He had placed a chrysalis in a bottle, with a little damp earth, in order to watch its progress towards transformation into a moth ; a Fern and a Grass began to vegetate, and, to his surprise, continued to show a healthy appearance, the former on its more perfect development proving one of his favourites, which he had often failed in rearing under ordinary circumstances. On investigating and questioning himself on these appearances, the answers readily presented themselves, inasmuch as all the requirements of nature were contained within the bottle—air, light, and moisture. Many persons had fallen into the error that Ward's cases were, or ought to be, hermetically sealed; on the contrary, a change of air is frequently necessary; this will imperceptibly occur in the closest made cases, or they would inevitably burst. The trough to contain the earth may be made of any materials—earthenware or wood pitched inside ; but the best are zinc. Of all, by far the best were stated to be bell-glasses, which are also admirably adapted for cut flowers, which are long preserved in them, as in the case of a Camellia, which, on one occasion, had retained its beauty for nearly a month. To size there are no limits—from an ounce phial even to the Crystal Palace itself. The decay of a healthy plant on transmission to a room in town is effected by the variety of noxious gases, evaporation from dryness of air, frequent and sudden alteration of current and temperature, deposition of dust, soot, &c., the latter especially inimical; all these were provided against by the glass case, while the moisture which was raised became condensed on the sides of the glass on occasions of change in the external temperature, accumulating and descending to the earth, at the bottom becoming more perfectly aërated, and in a state better adapted for stimulating and nourishing the plant. So complete is the *routine* in such a little world, in itself independent of external circumstances, that the old bottle sealed up 19 years since is green with vegetation, though the deposits of Confervæ on the inner surface materially disfigure its appearance. This bottle has had no fresh moisture since first closed. The advantages, besides those of mere ornament, were stated to be great—to the poor man in hospitals, treatment of the insane, transportations of plants from one country to another, duration of flowering, to all ranks confined in cities and sick rooms, they were stated to be a blessing. At St. Thomas's Hospital a subscription has been set on foot to provide cases, one of which was exhibited, most elegant in form, and in these the patients found a fruitful source of gratification. One of the advantages belonging to cases of this kind was the facility of transmitting plants from one country to another. Mr. Fortune has sent to this country 250 specimens, out of which 215 have arrived in health. Mr. Ward successfully forwarded to Sydney a variety of English plants in a case that was five months on the passage ; on its arrival there the Primrose was just blossoming; and this case subsequently returned to England with a collection of Australian plants. The carbonisation of the atmosphere by animal respiration, and the restoration of oxygen by vegetation, is a well known fact, and upon this Mr. Ward claims the merit of suggestions as to sanitary buildings in which vegetation would form a conspicuous feature. In connexion with the restorative nature of the process of vegetation, a taper was put under a bell-glass containing a Rose and other flowers, and was extinguished in 10 minutes. But after exposing the glass to the sun for about three hours, the taper could be again kept alight for the same period as before. In the same manner vegetation in water would be found to restore the oxygen, and in consequence it was possible to keep fish in air-tight cases, when vegetation was allowed to accompany them. To Mr. Ward was due the credit of having first introduced a vivarium into a closely glazed case in 1841, and for having depended for the renovation of the air necessary for the gold and silver fish contained therein upon the purifying action of associated plants, such as Pontederia crassipes, Pistia stratiotes, Valisneria spiralis. Mr. Bowerbank took the hint from Mr. Ward, and established a little vivarium in a large glass jar—stickle-backs, minnows, and fresh water snails, and with plants of Valisneria, and covered the mouth of the jar with glass, so as to make it a closed case. Snails for the purpose of removing the Confervæ that cover the leaves of Valisneria and other aquatics were first recommended in a note in the number of the "Microscopical Journal," for September, 1841. It was, however, stated that so long ago as 1763, Ledermüller had published, in his "Microscopical Recreations," a figure of an open-mouthed bottle containing fresh-water zoophytes, associated with Duckweed, Chara, and other plants. Mrs. Thynne first introduced marine vivaria into London; having brought some living Madrepores up to town in 1846, from Torquay, she placed them in two glass tanks, and at first effected aëration of the water by having it daily taken out and poured in gradually from a height, occasionally sending for fresh sea-water and thoroughly renewing it; after a year or two her Madrepores seemed to flag, and then she procured some pieces of rock and shell with living seaweeds attached, and subsequently depended upon the counterbalancing action of these. Dr. Ward decidedly entertains sanguine hopes that success will ultimately attend the adaptation of the principles in extension to the maintenance or restoration of health to the human frame, although he admits that difficulties would present themselves in the attempt to realise such adaptation.

Reviews.

Histoire Naturelle des Végétaux Parasites qui croissant sur l'Homme et sur les Animaux vivants. Par C. Robin, D.M. 8vo. pp. xvi. and 702. Avec un Atlas de 15 planches gravées, en partie coloriées. Paris, 1853.

We noticed a few years ago the academical thesis on this subject, which was maintained by the author when a candidate for his doctor's degree, and which was a highly creditable production, giving good promise of future success in a line of study in which there are few special labourers, though there are multitudes of scattered treatises on individual cases, unhappily too often proceeding from the pens of persons who are by no means proficients in that branch of botany, without a competent knowledge of which it is almost impossible to avoid making blunders. There was evidence in the treatise just mentioned, that the subject had not been taken up merely for the passing occasion, as it was written with a tone of interest which could hardly prove deceptive, and we have now before us in the present delightful volume full proof of a continued and increasing interest, insomuch that it would be difficult to point out what sources of information have not been investigated, or what particular branch of the subject has been neglected. The vegetables which find a fitting matrix and finally induce disease in living animals are far more numerous and various than would at first be supposed, and it is now incontestible that no man can pretend to an accurate knowledge of disease without making himself acquainted with the facts here reported. No less than 87 species are enumerated as properly growing on animals, the greater part of which, if not all, commence their growth while the animals are yet alive, producing as their consequence either death or serious disease. In every case where the author has been able to investigate the matter for himself, science has derived benefit from his observations, and in other cases he is not answerable for error or imperfect description. The least happy part perhaps of the volume is the appendix on the bodies found in the dejections of patients suffering under cholera in 1848 ; but this is exactly one of the cases in which he has been obliged to depend on others, without any opportunity of examining the bodies in question himself. There is no doubt that the larger bodies were of a vegetable nature, and Mr. Henfrey's notion that they were pollen grains of some Thistle or allied vegetable is possibly very near the truth—certainly much nearer than that which was once asserted, that they were spores of bunt which had entered into the composition of the bread devoured by the patients.

We have already had occasion to speak of the more interesting matters contained in the volume, and shall not enter further into it at present. It has already commanded a considerable sale in this country, and we doubt not that there will be an increasing demand for it, which we trust may prove a fresh incentive to exertion on the part of the excellent author.

New Plants.

51. Alloplectus Schlimii. *Planchon and Linden.*

A stove soft-wooded plant from New Grenada, where it was found by Schlim in the deep damp ravines of Sinto, near Bucaramanga, at an elevation of 4—5000 feet. It has been introduced by Mr. Linden, who has it for sale. It is similar in habit to other species of the genus, being more remarkable for the rich colours of the foliage and calyx than for that of the corolla ; the first is deep rose colour underneath, the second scarlet, the third dull deep violet. It requires the same treatment as a Gloxinia. There is a good figure in a late number of the *Flore des Serres* of Mr. Van Houtte.

52. Cercis Japonica. *Siebold.*

Judging from a figure of this in the "Flore des Serres," it is very like *C. Siliquastrum*, from which Mr. Van Houtte states that it is distinguished by its leathery leaves. We have not seen a specimen, but it appears to be fully as handsome as the common Judas tree, and as hardy.

53. Clematis patens, *Decaisne* ; var. *Sophia.* Van Houtte.

This is a very large-flowered variety of what is called in England *C. cærulea*, but which appears to have been first named *C. patens* in the Proceedings of the Brussels Academy. Its peculiarity consists in the presence of a broad green band down the middle of each sepal. *Flore des Serres, t.* 852.

FLORICULTURE.

Cultivation of the Pansy from Seed.—The seeds may be collected all through the summer months, but they should be saved only from the very best flowers, leaving but one or two pods to ripen on each stem. They should be sown from the middle of next month to the middle of June, but not later, because it is desirable that the plants should flower the same summer. They are best sown in the open border, in a shady situation, where the soil retains its moisture, which is of much importance to the young plants. Sow the seeds in a light rich soil. Make the latter level on the surface with the back of a spade, and cover the seeds about the eighth of an inch deep, again lightly pressing the surface of the bed with the spade. When the plants shall have grown to the height of an inch, they should be pricked out in a bed at from 4 to 6 inches apart, in a part of the garden which is rather shady ; let them be well watered with a can having a rose with very fine holes in it, and they must be shaded for a few days, until they have become established. They must be kept quite free from weeds, both whilst in the seedling bed and after transplanting. It is not advisable to remove the young plants during the months of July or August, the weather generally being too hot and dry. As they bloom, throw away all that have not some strong recommendation ; looking more to form than to colour, this being the first requisite in a good Pansy. Discard all that have flimsy petals, or notched and rough edges. Such as are good cut back early, that they may throw out side shoots more abundantly, and increase by cuttings as fast as possible. The first object to be desired in a Pansy is, as I have just stated, symmetry of the flower. The petals should be large, thick, broad, and flat, lying upon each other so as to form a circle ; the colour should not be cloudy, but clear and distinct. Worms, snails, and slugs commit great depredations on seedling Pansies, if care be not taken to prevent them. *S.*

National Floricultural Society, *March* 23.—Mr. Beck in the chair. Messrs. Henderson contributed a very handsome Camellia on this occasion, named Marguerite Gobillon. In colour it is pale blush, mottled and striped with pink. It is a good-sized well-formed flower, which cannot possibly fail to be a favourite. Of seedling Cinerarias Mr. Bousie, of Stoke Park, sent Rose of England, a fine white ground sort, with a medium margin of rosy purple, petal broad, and form and disk good. Label of commendation awarded. Cineraria Delicata, from the same grower, could scarcely be called a first-class flower—it is pure white, narrowly margined with rosy purple. A very good seedling Pansy, named Mr. Thompson, came from Mr. Bragg, of Slough. It is a yellow ground kind, with broad margin of deep maroon; eye bold, with a regular lacing of yellow on the lower petals. First-class certificate awarded. Mr. Ayres sent cut flowers of six varieties of very pretty Tropæolums. Mr. Rosher, St. John's Wood, contributed a seedling Cineraria called Pet, a clear white sort, with a rather broad margin of rosy carmine, petal and disk good. From Mr. Ruffett, Brocket Hall, came a seedling Cineraria named Rosea alba, also a good white, rather broadly margined with rosy pink; disk, however, rather coarse; Lady Palmerston, from the same grower, a white with medium margin of rosy purple, promises to be a useful variety. From Mr. Kendall, of Stoke Newington, came, amongst other Seedlings, Cineraria Paphian Queen, bright carmine, not a first-rate flower, but desirable on account of its colour. Mr. Turner contributed a box of Pansies, amongst which were good blooms of Emperor (Hale's), Ophir (Widnall's), Memnon (Turner's), a very dark rich flower; Pandora (Hunt's), Flower of the Day (Downie and Laird), a rich dark kind ; Lord John Russell (Turner's), a good yellow ground; Satisfaction (Turner's), yellow ground and well formed; Marchioness of Bath (Wheeler's), one of the best white grounds; Charles Turner (Hale's), Admiral

Dundas (Turner's), yellow ground, and Miss Stewart (Hale's), white ground. The same exhibitor also furnished a collection of Cinerarias, all very dwarf compact plants. Of seedlings, among them the most remarkable was Lady Mary Labouchere, a variety possessing first-rate properties; in colour it is clear white, narrowly margined with deep porcelain blue; first-class certificate awarded. To Mrs. Foster a certificate of merit was awarded: it is a white sort, broadly margined with rosy lilac. Mr. Turner also sent a seedling Cinerara named Sir C. Napier, a dark blue kind with broad petal and good form, likewise specimens of Polyanthus George the Fourth and Admirable, two pleasing kinds.

Miscellaneous.

Presentation to Mr. Brown, of Arniston.—Mr. James Brown, who for many years discharged the duties of forester to Robert Dundas, Esq., of Arniston, was entertained to dinner, on Friday, 16th ult., on the occasion of his leaving Scotland to enter on the surveyorship of the Dean Forest, to which he has been appointed. Mr. M'Corquodale, forester, Scone Palace, occupied the chair; and Mr. Thomson, deputy-surveyor of Chopwell Wood, acted as croupier. The chairman, in a short and appropriate speech, endeavoured to express the feelings of respect and esteem which not only himself but every one present entertained towards Mr. Brown, whose well-known public character was only excelled by his worth as a private friend. As a token of their regard, he presented to Mr. Brown a handsome gold watch and chain, accompanied by an elegant gold brooch for Mrs. Brown. The conversation of the evening chiefly related to forest ng affairs, in which many of the party were professionally interested, and the meeting did not separate before originating a movement likely to do good service in placing forestry in a better position than it has hitherto occupied in Britain. On the suggestion of Mr. Thomson, it was agreed that as agriculture and horticulture had much improved by Associations for holding discussions on their respective branches, it was desirable that something of a similar kind should be done for forestry; and accordingly an association was formed with this view, and a committee was appointed for the purpose of drawing up rules for the conduct of the same:—President: Mr. Brown, Dean Forest. Vice-President: Mr. M'Corquodale, Scone. Secretary: Mr. J. Alexander, Nursery and Seedsman, Edinburgh. Treasurer: Mr. Anderson, Nursery and Seedsman, Perth. Committee: Mr. Taylor, Camperdown; Mr. Balden, Lennoxlove; Mr. Cowan, Arniston; Mr. M'Laren, Hopetoun House; Mr. Forbes, Whittingham; Mr. M'Donald, Bargany; Mr. Thomson, Chopwell Wood; Mr. M'Laren, Shaw Park; Mr. Gardiner, Eglinton Castle; Mr. Rutherford, Buckden; Mr. Balden, Bywell Castle; Mr. Campbell, Alloa House; Mr. Thomson, Culhorn; Mr. M'Cleish, Alnwick Castle; Mr. Dickson, Charleton. It was agreed that the object for which the association has been established should be made known in the horticultural periodicals, and that the co-operation of those interested in the scheme should be solicited. The meeting adjourned till an early day in May. *Scotch Newspaper.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY.—During the continuance of cold, easterly winds, which we are now experiencing, air must be admitted with caution, opening the ventilators on the sheltered side of the house, and avoiding as much as possible the passage of cold, drying currents over either plants in bloom or those commencing growth, for in either case they would be highly injurious. See that twiners which are starting into growth are kept free from insects, as these, if allowed to gain a footing upon the young tender shoots, will soon do a vast amount of mischief. Mandevilla suaveolens is one of the most beautiful and useful of twiners, but it is subject to the attacks of green-fly and thrips when commencing its growth in a cool house, and unless these are eradicated, they will greatly retard its growth, and prevent its blooming early; and it is well worth any attention or care it may require, for it almost rivals the lovely Stephanotis itself in beauty, and is not much inferior to it in fragrance, and it grows and blooms as freely in the conservatory as the Stephanotis does in the stove. It requires, however, to be kept dry at the root during winter, and should not be encouraged to start into growth early in spring. In a close-roofed conservatory, such as was recommended some years ago, it has been one mass of bloom from the middle of July till November.

FORCING DEPARTMENT.

PINERY.—Where Pines are grown in pots, it is no bad practice to re-arrange the fruiting pit about this time, placing those showing fruit by themselves, so as to be able to afford them a rather dry atmosphere while in bloom, while those following to keep up the succession can also be placed in a warm part of the pit. Indeed, where a continuous succession of ripe fruit must be secured from a moderate quantity of plants, frequent re-arrangements will be found necessary, placing the most promising plants in the warmest part of the pit, or in case of too many showing at one time, removing a portion of them to the coolest part, to retard them slightly. This, however, is a matter which will be more effectually learnt by careful observation, and a season's practice, than by any other means. Give plants swelling their fruit plenty of manure-water, and afford them a moist humid atmosphere. VINERIES.—Where fermenting materials are employed for warming the borders, the heat must not be allowed to decline at present, and without prompt attention it will be very apt to do so under the influence of the "March winds" now prevailing. Ventilate cautiously, using the ventilators on the sheltered side of the house only on cold windy bright days. During weather such as we are now experiencing it requires no small amount of time and attention to give sufficient air at all times without admitting cold drying currents; but this must be carefully attended to at any expense of time or attention. Attend to last week's directions as to disbudding, tying, &c., and proceed with thinning the fruit, &c., in the succession house as soon as ever the berries are fairly set. Maintain a moist humid atmosphere, and keep a sharp look out for red spider. Give French Beans in a bearing state a liberal supply of manure-water, and see to keeping up a succession of them. MELONS.—Encourage those newly planted out with a close moist heat, so as to get them into free growth as quickly as possible; but plants that are fairly established should be kept cooler, admitting air on every favourable opportunity, in order to secure short-jointed fruitful wood. Keep the shoots thin and regular, pinching out any not wanted, but avoid stopping the main shoot until they reach the sides of the pit, when by pinching out the point the laterals will start into growth and show fruit abundantly. Do not let the night temperature exceed 65°, and air should be admitted as soon as the glass rises to 75°; but be very careful of cold winds. See to providing plenty of young plants for succession crops, and endeavour to get these strong and vigorous by keeping them near the glass, and not allowing them to suffer for want of pot-room.

FLOWER GARDEN AND SHRUBBERIES.

Nothing is so injurious to recently transplanted shrubs, especially large sized evergreens, as cold drying winds; and where the soil is of a sound dry nature, watering must be resorted to at once, giving a liberal application, without loss of time, to such plants as may appear to require it. It is of the utmost importance to well care for things after transplanting until they can form fresh roots, but this is often neglected at the present season until the plants get greatly injured, and when this is the case it requires ceaseless attention to carry them over the summer, besides the loss of a season's growth. Such things should have every necessary attention until they get established, for without this it is folly to expect them to succeed.

KITCHEN GARDEN AND HARDY FRUIT DEPARTMENT

After the long-continued favourable weather for out-door operations which we have experienced, all kinds of work here should be in a forward state. Take advantage of the dry firm state of the ground to get manure wheeled upon quarters where it is wanted, and to push forward any jobs which may involve wheeling. If any nailing remains to be done, get this finished as quickly as possible, and do not neglect to protect the blossoms of Peach and Apricot trees, so as to secure a crop if possible. Whatever kind of covering is used, it should be so arranged as to be easily removed on fine days, and let down again at night, for the thinnest covering is injurious to the trees in sheltering insects, and obstructing the light, &c., when allowed to remain all the time the trees are in blossom. See that ground is in readiness for Asparagus, Seakale, and Rhubarb, which should be planted soon. These require a deep rich soil, which should be trenched 2 feet deep, with plenty of rotten manure well incorporated with the bottom spit; indeed the ground can hardly be made too rich, particularly for Asparagus. This, when planted in well-prepared soil, is very productive, yielding a vast quantity of fine strong shoots every season; whereas if planted on poor shallow soils, no after attention in the way of surface-manuring, or watering with manure-water, will serve to secure first-rate heads; and it is so much esteemed in most families, that the trouble or expense necessary to properly prepare the ground should not be complained of, particularly as beds rightly made last for many years.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON, For the week ending March 23, 1854, as observed at the Horticultural Gardens.

March.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Of the Air. Min.	Of the Air. Mean	Of the Earth. 1 foot deep.	Of the Earth. 2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 27th, 1850—therm. 75 deg.; and the lowest on the 27th and 28th, 1850, and the 1st, 1838—therm. 16 deg.

Notices to Correspondents.

ACACIAS: *J H B.* Much obliged. We will keep the papers, but just now we are overwhelmed with matter, and cannot possibly find room for the article.

ANTS: *A George.* It is a correspondent, not we, who states that gas water will destroy ants in Grass. We should not choose to apply it to the roots of Peach or Nectarine trees.

CONIFERS: *J T.* Chundrow or Kundrow is understood to Abies Smithiana, the Himalayan Spruce. Raise the seed in a pan of loam in a cool frame; and when the plants have made their second leaves, transfer them to separate pots.

CRYPTOMERIA: *H M.* What you mention is nothing new. This plant has been flowering near London for several years past.

EALING PARK. We are requested to contradict, on the authority of Mrs. Lawrence's own gardeners, a report that it is the intention of that lady to entirely give up plant growing. "On the contrary, she intends still to grow a small but extremely choice collection of Orchids, stove, greenhouse, variegated plants, &c. And the flower-garden and pleasure-grounds, &c., at Ealing Park, have been all the winter undergoing improvements, for which purpose more than 20 men have been constantly employed. Mrs. Lawrence's present collection of plants occupies the enormous number of 23 glass houses, most of them of large size, these are to be reduced to 13 (a large number stil for a private grower); and when it is known that this lady is also an amateur in farming, poultry, &c., it is not surprising that a delicate state of health should induce her to give up the large collections of Orchids, stove, and greenhouse plants, which we believe will shortly be to be disposed of; indeed, we understand more than one party is already in negotiation for the Orchids *en masse*."

FLUES: *W.* We do not see why your flue should not draw under the circumstances you describe. It will only be necessary to take care that the fuel is not thrown in too far; should tha happen, it will collect at the elbow and produce explosion. If you employ hot water, use 3-inch pipes and the smallest boiler you can get.

FRUITS: *A H.* The Prune de Montfort is described as being large, oval, violet, tolerably juicy, and rich. The Cerise Bel e Magnifique, Belle de Sceaux, or Belle de Chatenay, is said to be very large, red, and juicy. It is not classed among the Bigarreau, or firm-fleshed Cherries. The tree is vigorous and productive, suitable for the open ground, or a wall with an eas aspect.‖

FUNGI: *C F.* It is common mouldiness acting upon dead stems in a damp, ill-ventilated place.

GRAPES: *M.* As you wish to have Black Grapes for a span-roofed greenhouse, well exposed to the morning, midday, and afternoon sun, but without fire heat, you cannot do better than plant the Black Hamburgh and Black Prince, but most of the former.‖

LIMES: *J C L.* The plant is doubtless true. If a seedling, as we understand, then it is probably not old enough to bear fruit though it flowers. Age will cure that evil. But try the effec of putting the pots in gentle bottom-heat as soon as the flowers are half-grown, and keeping them there till the fruit sets.

LUCUMA DELICIOSA: *M G.* We are not aware whether this is in England. It is a kind of Sapotilla Plum, all the forms of which are spoken well of by weary travellers. It will require a Banana house.

NAMES OF PLANTS. We have been so often obliged reluctantly to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*May.* Erica carnea.—*A H.* Anemone palmata. We have at last discovered that the Aquilegia californica is so called in some gardens, but without authority. It is a handsome form of A. canadensis, as we before suggested.

PERFUMES: *Wallflower.* A series of articles on the perfumes of plants, and the different modes of obtaining them, appeared in our volume for 1849, where you will find all the information you seek for on the subject.‡

POISONED PLANTS: *W C.* You should not have put your plants into your house till the smell of paint was gone. Bad smells, that is to say, smells which disagree with plants, are as injurious to them as to animals. There is no remedy. When the smell is quite gone your plants will perhaps push again.

SEEDS: *W E.* Sow them now in *loam* in pans, placed in a cool frame. The seeds should be just buried. As soon as the young plants have formed their second leaves, transfer them singly into separate pots—still keeping them in loam. You *may* succeed without a frame, by treating the Coniferous seeds like Larch; but in that case you had better defer the sowing till the ground becomes warmer, and let them remain in their seed-bed till next spring.

SPRING PROTECTION FOR WALL TREES: *A W.* We are unacquainted with tanned cotton net; but if it keeps off cold, and admits air and insects freely, it will doubtless answer the purpose. The inverted shoots of Spruce Firs tied to the branches, straw-bands, canvas blinds, Birch twigs interwoven among the branches, are the materials most commonly in use.‡

SWEDTIA: *M A.* None are in the trade. You must endeavour to procure them from the place where you saw them. Your Chicory is unskilfully managed; probably kept too cold. It ought to be sweet. Have you not been blanching Dandelions?

TANKS: *R W.* Lead is so apt to be dissolved by water that we cannot recommend it as a lining of a cistern, if the water is to be drank or used in gardening. The purer the water the greater the chance of poisoning. You had better use iron—or what is far better—slate.

WOODS AND FORESTS: Σσ. We have most carefully confined ourselves to the official evidence in the Parliamentary papers; not choosing, in so important a matter, to trust to other sources of information. We have read these papers carefully, and upon them our opinion is formed. If the evidence they contain is not trustworthy, why do not the parties concerned disprove it? With regard to the Forest of Dean, we have now seen Mr. Machen's circular, which, although written in a good spirit, does not, in our judgment, meet the case, except in some particulars. This will probably form part of the documents on which we suppose Mr. Drummond's motion is to be founded, which we shall not attempt to anticipate. We are perfectly aware of the state of the Forest of Dean in former days: we know that Mr. Machen has done good service as a magistrate in reducing a set of lawless desperadoes to order and obedience; but we have never entered upon that subject, with which in fact we have nothing to do. The question before us is strictly this; has the management of the timber and plantations been such as to render them as profitable as they should have been, or has it not? After reading all the published evidence, from the appointment of Lord Duncan's committee to the present session, we are bound to answer in the negative. As to misdemeanours and their consequences, and mineral management, we are not called upon to discuss these subjects, nor is it our intention to do so. Permit us to advise you, before you form your own opinion, to peruse the evidence collected by Lord Duncan's committee. Perhaps you do not know that this forest cost, between 1803 and 1848, above 400,000*l.*, exclusive of an outlay of 154,000*l.* in 1817; and that its average net return had not, up to 1848, been quite 4000*l.* a year, including all mineral profits. The place has not, in fact, yielded altogether ordinary interest upon even the 154,000*l.*

MISC.: *Q Q.* No doubt the tree described in "Revelations of Siberia," as a Cedar bearing eatable nuts in such abundance that oil is expressed from them, is Pinus Cembra, a very hardy coniferous plant. The so-called yellow flowering Acacia, said to be the only tree hardy enough to make hedges of near St. Petersburgh, is probably some species of Caragana, perhaps spinosa.

NOTICE.

THE SEWAGE MANURE COMPANY beg to state that the higher price of PEAT CHARCOAL, and the increased expense of making the Manure in its present improved state, have compelled them to advance the price of the Manure to 4*l.* per ton; but at this price it still is the cheapest, and one of the best Manures that can be used, yielding a greater return for the outlay than Guano or any other Manure.

N.B.—No charge will be made for sacks; and in quantities of a ton, or upwards, it will be delivered at the Railway Stations in London free of charge for cartage.—March 18.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only; and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.

It may also be had from Messrs. G. Gibbs & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London: and from all the other Agents of the Company.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. Edward Pursee, Sec.
Bridge Street, Blackfriars.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures.
Wm. Inglis Carne, 10, Mark Lane, London.

PEAT MOSS CHARCOAL, AND OTHER MANURES.—The Undersigned are appointed sole Agents by the Peat Moss Charcoal Company, for the sale of this valuable fixer and distributor of ammoniacal matter.

Also on Sale, Peruvian Guano, Superphosphate of Lime, Gypsum, Nitrate of Soda, Bone-Dust, Sulphuric Acid, and all other Manures of known value.—Apply to Mark Fotheregill & Co., 204A, Upper Thames Street, London.

THE FOLLOWING MANURES are manufactured at Mr. Lawes' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

SUPERPHOSPHATE OF LIME MANUFACTURED by Mr. J. C. NESBIT'S IMPROVED STEAM MACHINE. The following is the analysis of an average sample.

"College of Chemistry, Agriculture, and General Science, 38 & 39, Lower Kennington Lane, London.

Analysis of Sample of Superphosphate of Lime from Mr. Jolliffe:

Moisture		13.97
Organic Matter, &c.		21.98
Silica		6.05
Phosphate of Lime		35.27
Soluble	16.10	
Insoluble	19.17	
Sulphate of Lime, &c.		22.73
		100.00
Nitrogen (equal to)		1.16
Ammonia		1.41

(Signed) J. C. Nesbit."

Delivered free at a Wharf or Railway Station in London at 6*l.* per ton.—Apply to E. Y. Jolliffe, 70, Mark Lane, or the Works, Lavender Dock Wharf, Rotherhithe.

Agents wanted in all the principal towns.

SEWAGE GUANO, 5*l.* 5*s.* per ton (bags included). Circulars and Testimonials forwarded on application.

DEODORIZING CHARCOAL, 1*l.* 10*s.* per ton (bags to be returned). Terms: Cash on delivery.
The Manchester Sewage Guano Company, 3, Watling Street, Shudehill, Manchester. E. Ransbottom, Agent,
John Thompson, Secretary.

PURVEYORS OF LIVE BIRDS
BY SPECIAL APPOINTMENT TO HER MAJESTY AND H.R.H. PRINCE ALBERT.

BAKER'S POULTRY RESTORATIVE.—Ten years' experience of its success, in all Diseases of Poultry, justifies them in recommending it with the greatest confidence; one among its many advantages being the facility with which (in its liquid form) it is administered, obviating the troublesome necessity of handling the birds, and speedily imparting such vigour and high condition that can be acquired by no other means. Price 2*s.* 6*d.*, either in Liquid or in Pills, with directions for Roup, &c. By all Chemists.

BAKER'S REGISTERED FOUNTAINS, for Poultry, Pheasants, and Pigeons, supplant all others. Four quarts, 6*s.* 6*d.*; nine quarts, 8*s.* 6*d.*—Messrs. Baker, City; and the Pheasantry, Beaufort Street, Chelsea.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

BAILY'S ROUP AND CONDITION PILLS FOR POULTRY.—This remedy has been extensively tried with uniform success, and is offered to amateurs and the public with the greatest confidence. It will effectually overcome that disease which has hitherto been the bane of the poultry-yard, and destroy that apprehension known to all poultry keepers, when a favourite and valuable fowl is seen to droop. It is inestimable for poultry returning from exhibitions, and greatly facilitates moulting.—Sold, with full instructions for use, in boxes containing 50 pills, by John Baily, 113, Mount Street, Grosvenor Square, price 3*s.* per box, or by post 3*s.* 4*d.* "Fowls, by Baily," the most useful and plainest treatise of the day; price 2*s.*, by post 2*s.* 6*d.*

Baily's Registered Fountains, universally adopted and approved. Drawings and particulars, by post, on application.—113, Mount Street, Grosvenor Square.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

REDUCTION IN PRICE.

WEIR'S IMPROVED GALVANISED WROUGHT IRON LIQUID MANURE PUMP.

The Fittings of these Pumps are wholly of Brass, and there is no leather or other matter which can be affected by the manure.

Price, complete, with 10 feet of Flexible Suction Pipe, 4*l.* 15*s.* Terms, cash on delivery.

Edward Weir, Agricultural Engineer, 16, Bath Place, New Road, London. Removed from Oxford Street.

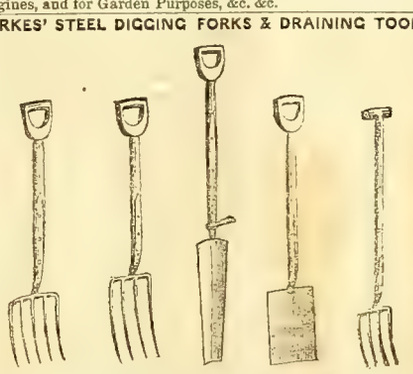
Catalogues, with Illustrations, sent free by post.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*

WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

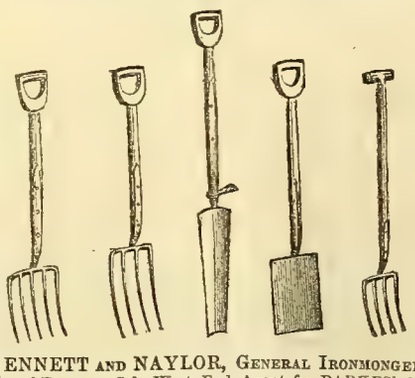
ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. Burgess & Key, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.



MESSRS. BURGESS AND KEY, as Mr. Parkes' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

TO AGRICULTURISTS, GARDENERS, ETC.



BENNETT AND NAYLOR, General Ironmongers, and Factors, Sole West End Agent for PARKES', late WINTON PARKES' CELEBRATED STEEL DIGGING FORKS and TOOLS. Also for the only efficient Stove, with or without a flue, suited particularly for Conservatories and Greenhouses, Patronised by her Majesty. Price 12*s.*, and upwards, at the Great Western General Ironmongery Warehouse, 255, Oxford Street, between Park Street and North Audley Street. Established for the sale of all descriptions of Ironmongery at Wholesale Prices. Sheet, Hoop, Rod, and Bolt Iron; Locksmiths and Bell-hangers. Patent Fuel, to be used with the Stove, 2*s.* 3*d.* per bushel.

SAMUELSON'S PRIZE FORKING or DIGGING MACHINE, as applied to Spring Cultivation, serves to thoroughly pulverise land which has been trodden by sheep or autumn ploughed, deepening the staple, leaving no pan, dragging up the Couch Grass, and preparing a finely divided seed-bed.

Extracts of Testimonials from persons using it.

"Answers thoroughly; brings everything to the surface."—*E. W. Wilmot, Congleton.*

"The very best a man can have upon a mixed or stiff soil, it so thoroughly pulverises it."—*Joseph Cooper, Acton Burnel, Salop.*

"I inform you, with the greatest satisfaction, of its success."—*Francis Hamilton, Friars Place, Middlesex.*

"Attached horses at half-past 8, on 5½ acres, finished at a quarter past 3, making first-rate work."—*J. Kirby, Bodicott, Oxon.*

"Has been working every day."—*T. Cardus, Barwell, Surrey.*

"Will do a given amount of labour, not only cheaper but better than the plough."—*J. J. Mechi, Tiptree, Essex.*

"Let me have one at your earliest convenience."—*Earl of Essex, Cassiobury, Herts.*

"Send to Exton Park one of Samuelson's Forking Machines for *Earl of Gainsborough, Oakham.*"

"Besides improved tillage, economises ploughmen."—*P. Gener, Cuba.*

Price 24*l.* 10*s.*, the general purpose size; and 27*l.* 10*s.* large size, Cash; at the Works, Banbury.

HOSE PIPING.—Great Reduction in Price.

WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, Burgess & Key, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

NEW AGRICULTURAL ROOT.

SUTTON'S CRUICKSFIELD HYBRID SWEDE. This is very distinct from the Swede and the Kohl Rabi, but partakes of the nature of each of those valuable roots, from which indeed it has proceeded. It is of the shape and size of Skirving's Swede, but is much hardier, and has the flesh of the Kohl Rabi. Cattle, and especially Sheep, eat it with great avidity, preferring it to Swedes, when both are presented to them.

Particulars of Culture, &c., will be sent post free on receipt of one penny stamp.

Address, John Sutton & Sons, Seed Growers, Reading, Berks.

N.B. We have an excellent Stock of Swede and other Turnip Seeds, Mangold Wurzel, and White Belgian Carrot Seed, &c.

NEW FARM SEEDS, GROWTH OF 1853.

WILLIAM E. RENDLE AND CO., Seed Merchants, Plymouth, *have a very large and well selected Stock of all kinds of* SEEDS *required in Agriculture, grown by Farmers of the first respectability and experience in Devonshire, Somerset, Gloucester, Kent, Essex, Sussex, and several other counties.*

CARRIAGE OF ALL PARCELS ABOVE £1 FREE, SEE PRICE CURRENT.

The following are the prices of a few of the leading articles:—

Italian Rye-grass, 6*s.* to 7*s.* per lb.
Pacey's Perennial Rye-grass, 6*s.* per lb.
North Devon Evergreen Rye-grass, 5*s.* to 6*s.* per lb.
Rough Cocksfoot Grass, 5*s.* per lb.
White and Red Clovers, 7*d.*, 8*d.*, 9*d.*, 10*d.* per lb.
Swede Turnips, all the best varieties, 1*s.*, 1*s.* 4*d.*, to 1*s.* 6*d.* per lb.
Scotch Turnips, 1*s.*, 1*s.* 4*d.* to 1*s.* 6*d.* per lb.
Summer Turnips, 8*d.* to 1*s.* per lb.
Large White Belgian Carrots, 2*s.* per lb.
Other varieties of Carrots, 1*s.* 6*d.* per lb.
Large Red Mangold Wurzel, 1*s.* per lb.
Yellow Globe ditto, 1*s.* 4*d.* per lb.

All other kinds of Agricultural Seeds at fair remunerative prices. For full particulars see RENDLE'S "FARMING PRICE CURRENT AND AGRICULTURAL SEED DIRECTORY," to be obtained from the subscribers in return for six postage stamps.

William E. Rendle & Co., Seed Merchants, Plymouth.
Established 1786.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

Patron—His Royal Highness PRINCE ALBERT.
President of Council—Earl BATHURST.
Principal—Rev. J. S. HAYGARTH, M.A.
Professors, &c.

Chemistry—J. A. C. Voelcker, Ph D., F.C.S.
Geology, Zoology, and Botany—James Buckman, F.G.S., F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.
Assistant to Chemical Professor—A. Williams, M.R.C.S.

Students are admitted after the Summer and Winter Vacations, also in April and October. The annual fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer course is recommended. There is a department for general as well as for agricultural purposes.

Prospectuses and information can be had on application to the Principal.

The GUIDE to the ROYAL AGRICULTURAL COLLEGE FARM may be obtained of Hamilton, Adams, & Co., Paternoster Row, London; and Edwin Baily, Cirencester. Price 1*s.*

The Agricultural Gazette.

SATURDAY, MARCH 25, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS

Wednesday, March 29—Agricultural Society of England.
Thursday, — 30—Agricultural Imp. Society of Ireland.
Monday, April 3—Central Farmers' Club.
Wednesday, — 5—Agricultural Society of England.
Thursday, — 6—Agricultural Imp. Society of Ireland.

THERE is probably no better illustration of the remark made some weeks ago in these columns, that the real evidence of agricultural progress amongst us is to be found in quiet and comparatively unknown quarters, than is given in the present condition of Lord Radnor's estate, near Highworth, Berkshire. There is hardly a subject of any great agricultural importance which has of late engaged attention but will be found developed into actual practice there.

The following are instances:—A correspondent was lately recommending the preservation of plans of all the drains executed on a farm, so as to enable the examination of any spot without waste of time and labour in seeking for it. He will find plans preserved of the drainage here, in the manner which he justly recommends.

We have had discussions as to where the cost of agricultural improvement should lie—whether tenant or landlord should bear the cost of permanent improvements. Our own opinion is that the question does not admit of an answer. There is no duty nor even policy that we know of concerned in the matter—no general principle depending on either to regulate conduct in reference to the subject; so that every separate case must be decided between landlord and tenant on its individual merits according to the relative means, opinions, and will of the parties concerned. At Coleshill, however, the question is being systematically answered on the landlord's side, and farm after farm is being

taken in hand, drained, improved, and relet at a rent increased by a per centage on the landlord's outlay.

Again, we have had abundant criticism and scepticism on agricultural estimates—criticism we must say justified by ordinary experience on such subjects; the visitors to Coleshill will, however, find records of estimates and plans relating to complicated series of operations—the removal of fences—the drainage of land—the making of roads—the erection and improvement of buildings, and lastly, farm occupation for one or more years. He will also find records of actual cost, and evidence of actual performance: and we engage he shall come away from the inspection with the impression that it is possible to frame agricultural estimates correctly, and to carry out agricultural improvements at the cost and with the returns foreseen.

No subject has more properly, and of late more earnestly, engaged attention than the bearing of good and sufficient lodging on the social condition of the labouring classes, we venture to promise any intending visitor that he will find Coleshill a model village in this important respect; and that improvements here, as in other quarters, have been carried out with the same regard to economical and profitable investment as have guided Mr. MOORE (Lord RADNOR'S agent, by whom and under whom the whole has been accomplished) in other departments of his most successful management.

And talking of example villages, there has been ample recognition of the value of example farms of late. Now, no greater usefulness is attainable by such institutions than where they are not *professedly* example farms, but, without obtrusiveness or pretension to official authority, present to the inspection of all who choose to visit them specimens of good cultivation, good architecture, and good general management. Let us refer to the farmery at Coleshill, in illustration of the second point here named. It is on the largest scale of farmeries, and confessedly in the style fitted for a nobleman's home farm: the execution, space, style, and quality of work, and, therefore, the expense, are higher than a strict £ *s. d.* aspect of the question will justify. But for the principles of its arrangement, the skilfully managed connection of the different parts, the admirable adaptation of the circumstances of the site, and the perfect adaptation of each part to its purpose, we know of none excelling it. A longer description than we could give here, is extracted in another column from a Wiltshire paper. We may, however, just enumerate some of its merits in this place: and we would point out especially the very admirable arrangement of threshing, grinding, and cutting machinery; the accessibility and roominess of the granaries, and their connection with a cartway beneath; the relation of steaming-house and food stores generally with cattle boxes and stalls; the proper mixture of boxes, stalls, and yards—the first for fattening cattle, the second especially for stables (box feeding answering only in the case of animals continually standing on the litter), and the third for younger stock; lastly, the sheep-yards and the sheep-feeding house over a sparred and open floor, which seems specially adapted, and we might say *only* adapted to the case of sheep, which carry their bed-clothes continually about them, and do not suffer from so hard a mattress. Many other points might be noticed. We shall, however, allude to only one. The farm answers its *unasserted* purpose of a model farm also, by the interesting experiments progressing on it, especially in cattle feeding, to which we hope hereafter to attend, and in pig breeding—the latter having already resulted in the establishment of a breed which is daily rising in estimation.

This notice of these buildings is permitted us with a view to the extension of their usefulness as developing principles of construction and arrangement, which deserve adoption, without, however, necessarily involving exact imitation. The place is of course a private establishment, notwithstanding we are thus allowed to draw attention to it; but we doubt not those interested in the subject of farm buildings, or in the other subjects which have in this short notice been referred to, will obtain without difficulty that permission to examine the place which we readily received.

LET us make a single remark in illustration of the vague and general manner in which objections to the collection of agricultural statistics have been stated. Many farmers are apprehensive that an accurate statement of their crops would let their landlords know too much; but what is it, we should like to know, that landlords will then acquire which they now have not the means of obtaining? What is to prevent any landlord, for instance, riding over his own estate, and ascertaining from year to year the statistics of its produce? We might admit (although we know some landlords that are better judges than their tenants) that at present he is unable to form an opinion as to the amount of produce; but the tenant is surely to be pitied who concludes that he is to remain so, or rather that the progress of things will allow any landlord to continue in such a state of ignorance much longer. Moreover, we know landlords who employ agents whose duty, among other things, is to examine every farm and field, and enter their reports in an estate book of cropping kept for the purpose, and who, by reference to this book, can tell you at any time what this or that farm or field produces. And this is not only an exceptional fact—we would say it is a duty binding on those who have the management of estates, under that relationship between landlord and tenant which prevails over the greater part of England. In all such cases, experience has shown that the nearer the truth is approached, so much the better for both parties. The thing feared is that the *opinion* of the landlord on the farm produce should exceed the truth, and so rent be raised unreasonably, or, indeed, *at all*. Then, the remedy for this is, by publishing the truth, to ensure that his opinion be founded *on* the truth. At present, opinion is quite as likely to be founded on excessive estimates as on defective ones; and, we repeat it, experience has shown that the nearer the truth is approached, so much the better for both parties.

Then, take another aspect of the matter in which the landlord is not immediately concerned. The Central Farmers' Club declare that they do not believe farmers in particular are interested in the knowledge of the food supplies of the country. We can only say that the discussion which terminated in such a resolution ended most illogically; for many even of those speakers who carried it drew attention to the losses which holders of food had sustained by ignorance of the subject. The case is well put by Mr. MILBURN in his letter to the *Times* last Tuesday:—"The fact that corn has fluctuated cent. per cent. in price in three years out of seven is enough to convince farmers that statistical information would be useful to themselves as well as others." We ourselves, in one of these three years, sold several hundred sacks of Wheat at 6*s.* a bushel which rose to 12*s.* within a few months. Would not correct information as to the stock of food held by farmers and by factors have hindered us from doing this? And apart from individual instances—our case might well be rested on the fact alluded to by Mr. MILBURN, that the French, knowing their own necessities, were large buyers in our markets months ago, when English farmers knew nothing about the necessities of others or of their own ability, and while, therefore, supplies were readily provided at prices much below those which sounder information would have ensured for them.

Then comes the question of the possibility of reaching the information which is desired. The question, we would simply say, argues great ignorance of what is already yearly done in the same way. Mr. MILBURN disposes of it in a single sentence. All this information used to be obtained annually over thousands of acres when tithe was let from year to year. It is so obtained now over thousands of acres in the case of farms being left by out-going tenants.

We notice that on Thursday last Mr. CARDWELL stated, in his place in Parliament, that the Hampshire and Norfolk farmers have very generally replied to the inquiries addressed to them, not more than 3 per cent. of the circulars having been returned unfilled; that the cost of the inquiry in the two countries has been 850*l.*; and that the particulars ascertained have been the acreage of the several crops and the quantities of the several kinds of live stock.

SCHEMES OF CULTIVATION.

FROM a farm of 200 acres in the county of Surrey, of which about 50 acres are pasture, 20 acres stiff clay, and the remainder light loam inclining to sand, what receipts might fairly be looked for? what stock, and what number of stock should be kept? and what the fair cost of cultivating the same (putting out of the question, as already known, rent, tithes, and poor-rates) in wages, interest of capital, wear and tear, &c.? The questioner is the proprietor, and would be his own market to a great extent. The land is not now in good order, but is capable of being made more productive. The information conveyed in a plain manner, with a view to enable a balance to be struck between loss and profit, will be much esteemed by *A Neophyte*.

It is plain that the data are not sufficient for the information desired. The cost and returns of cultivation depend not more upon the character and quality of the soil, which is all we have given to us, than upon the method of cultivation adopted, which is not described. Our correspondent desires us in effect to *state* his dream as well as interpret it. We shall therefore suggest a rotation of cropping, estimate the cost of management under it, and suggest a way of disposing of the produce.

We assume 50 acres to be in Grass, 70 in arable green crops, 80 in grain. If the rotation on arable land be—1, Wheat; 2, Clover; 3, Wheat; 4, Mangold Wurzel; 5, Wheat; 6 Beans; 7, Wheat; 8, Clover; 9, Wheat; 10, Vetches and Turnips; 11, Wheat; 12, Cabbages; 13, Wheat; 14, Oats; 15, Swedes—then we should have 70 acres in Wheat, 10 acres in Oats, 10 acres in Beans, 20 acres in Clover, and 100 acres in Mangold Wurzel, Cabbages, Swedes, and Vetches or Turnips. If we assume a good quality of land, we may put the produce as follows:—

70 acres	Wheat ...	at 36 bushs.	=	2520	bushels.
10 ,,	Oats ...	at 60 ,,	=	600	,,
10 ,,	Beans ...	at 36 ,,	=	360	,,
20 ,,	Clover ...	at 12 tons	=	240	tons green food.
10 ,,	Mangold Wurzel	at 30 ,,	=	300	,,
10 ,,	Swedes ...	at 20 ,,	=	200	,,
10 ,,	Cabbage (2 crops)	at 30 ,,	=	300	,,
10 ,,	Vetches and Turnips	at 25 ,,	=	250	,,
25 ,,	Pasture ...	at 10 ,,	=	250	,,
25 ,,	[Do. aftermath]	at 4 ,,	=	100	,,

The Wheat is for sale, and may be worth 750*l.* to 800*l.* a-year. The Oats will just suffice for the three pairs of horses the tenant will need to keep. The Beans will be consumed on the farm.

The green food amounts to 840 tons for summer consumption and 800 tons for winter consumption, besides 25 acres of meadow hay, with 360 bushels of Beans, chiefly for consumption during the latter season. A tolerably equal stock may thus be kept through the year. And food to the amount of about 32 tons a week will in ordinary seasons be produced for cattle. If the food for horses and per centages for risks of various kinds, such as rotting of roots, &c., be deducted, there will still remain at least 4 tons of green food a day, available as food, and this will keep 400 sheep, or 200 sheep and 24 oxen, a stock which can be got on hand by purchasing, in June, 24 two-year old oxen to feed and fat in the course of 10 months or so, and 150 shearlings to fold on Clovers, and all off towards autumn, replacing most of these then with some 120 breeding ewes, and purchasing some 60 or 70 shearling sheep to feed in autumn. By consuming the green food in this way, probably 5*s.* a ton will be made of it, and 2*l.* a ton of the hay, along with the price of the Beans, and of what other food may be purchased. To the 750*l.* for Wheat, you have thus to add about 410*l.* for green food; 70*l.* for hay; and 90*l.* for Beans, or in all 1320*l.*

The CAPITAL undetailed required will be, without going into particulars—

For six horses	£200
Implements and harness, at least 1*l.* per acre ...	200
Wages, probably	400
To purchase live stock (some portion sold before purchase of rest), say	450
To purchase manure and cattle food, say... ...	100
,, seed, say	100
Rent and taxes	400
	£1850

The ANNUAL COST may be—

Seed	£100	0	0
Labour	450	0	0
Manure (food repaid)	50	0	0
10 per cent on horses	20	0	0
5 ,, live stock	22	10	0
10 ,, implements ...	20	0	0
Rent and Taxes	400	0	0
	£1062	10	0

This would leave a balance in favour of the tenant of 257*l.* 10*s.*, or about 14 per cent. on the capital employed.

We give this rough outline, which is built upon data that we have been accustomed to consider trustworthy. The result is brought out without any aim at it, simply as the unforeseen consequence of the estimates in detail; and it shall stand for what it may be worth, without revision, as it has been arrived at without intention. *M. S.*

NITROGEN IN GREEN CROPS.

IN considering this question (as I promised at page 155 to do), I am not disposed to hinge my elucidation of it on the jocose assertion of the estimable agriculturist of Sutton Waldron, "Give me manure enough, and I will grow Turnips on a mahogany table." I shall rather view it in the light of a proposition which I believe few will dispute, viz., that on a soil naturally of fair quality, but exhausted by cropping, I can, by the application of 3 cwt. of Peruvian guano per acre, together with inorganic manure suited to the different plants, grow good crops of Beans, Turnips, and Clover, assuming that the mechanical condition of the soil has been duly looked to.

I select the above crops as being those of most extended cultivation; and I purpose to consider them only as they serve the purpose of in-gathering aerial nitrogen. I do this, not forgetting that they also act an important part in elaborating from the soil, by a subtle alchemy of their own, inorganic matters which they prepare for the use of the cereal crops, which, as generally cultivated by thick sowing, are poor providers for themselves of inorganic food, as they are gluttons and wasters of nitrogenous food. In conducting my inquiry, I shall adopt the plan of a debtor and creditor account of the supply and product of nitrogen. The debtor side will be the same in each case, and will stand thus:—

Nitrogen in 336 lbs. Peruvian guano, at 14 per cent.	47.04 lbs.
Ditto added to the soil in nitric acid and ammonia carried down by a year's rain, assuming as correct the calculations given by Mr. Pusey in Royal Ag. Soc. Journal, p. 379	41.42 ,,
Total per acre	88.46 lbs.

The crops I shall examine by the light of Dr. Anderson's analyses as published in No. 30 of Highland Society's Journal.

Beans.—I shall assume 4 quarters per acre; and the

straw I take at the weight of experiments reported in the above Society's Journal. We shall thus have—

Grain 32 bushels (63 lbs.) 2016 lbs. nit. p. cent.	4.26	85.20 lbs.
Straw in-gathered, 2 tons, 448 lbs.	„	1.30	58.24 „
Stubble and roots left behind, 1 ton, 2240 lbs. nit. per cent. 1.30			29.12 „
			172.56 lbs.

Being 34.10 lbs. nitrogen (equal to 600 lbs. Peruvian guano) more than was supplied by the manure, and by the rain-washings of the atmosphere, even supposing that the whole supply had been appropriated by the growing plants.

The adaptation—thus shown to be great—of the Bean crop to place at the disposal of its cultivator an unbought store of nitrogen is further illustrated by the result (stated in "Blackie's Cyclopedia," p. 786) attained by an agriculturist combining science with practice, from the use of an appropriate inorganic manure, sulphate of soda. An application of 2 cwt. per acre of this salt gave an addition of 2 quarters of Beans; and though the straw was not tested by the weighing machine, its luxuriance testified to its being equally in excess as was the grain. Thus, from the use of an inorganic manure, so much additional vigour was given to the growing plant that it had in-gathered from the atmosphere, and enabled the cultivator to gather into his stackyard, 71.72 lbs. nitrogen. I may here remark that the power of absorption from the atmosphere belonging to this crop was, very correctly, ascribed in your columns of Jan. 24, 1852, by Mr. Russell, Kilwhiss, to the fact that "its vegetative powers co-exist with its flowering and seed-forming processes." Taking the knowledge thus presented to us by a trustworthy observer as a guide, we would attain to this striking result—that on a farm where 40 acres of Beans are cultivated (and there are many such in the Lothians of Scotland), the use of 4 tons of sulphate of soda would place in the stackyard (leaving out of consideration the roots and stubble left in the soil) the nitrogen of 9 tons 3 cwt. of Peruvian guano, or 8 tons 10 cwt. nitrate of soda.

Now, sulphate of soda is a refuse of our chemical manufactories, and is, I believe, in many cases, altogether lost; guano and nitrate of soda, I need not tell my readers, are both scarce and costly. Perhaps it is rather late to suggest, for this season, further trials of the same and cognate inorganic substances; but I should consider that I have done some service if these notes should bring out some further information on this subject.

Passing from Beans, which have surpassed my anticipations, I come to Turnips and Clover, which have much disappointed them; so much so, indeed, that I must give them a low rank—if one at all—as aerial collectors.

Of Turnips, I assume 25 tons, including tops and tails, as the full crop to be obtained under the conditions stated, *i. e.*, 56,000 lbs. — Nitrogen = 112 lbs., being 23.54 lbs. in excess of the supply.

Of red Clover, I assume 8 tons as a first cutting, and 4 tons as a second, *i. e.*, 12 tons—26,880 lbs. Nit. O_4 —107 lbs., being but 19 lbs. in excess of the supply; and when those crops are consumed by animals, we may safely suppose that no nitrogen in excess of that supplied will be found in the manure. *S.*

Home Correspondence.

Cement.—In answer to the inquiries of "Bagnalstown" about cement for using between woodwork and stove jambs, I recommend him to try an excellent "fire cement" made in Manchester, and which seems to stand any amount of heat. If your correspondent would apply to Messrs. Crowther, painters, &c., Ridgefield, Manchester, I have no doubt they would supply him with it, or tell him where it can be procured. *J. W. T., Cheshire.*

Disease in Lambs.—I shall be glad if you can inform me on a disease that is proving very destructive. It is one of those in which treatment is generally out of the question; the animals are perhaps taken in the night, and are found dead in the morning. The great object, of course, is to discover the causes; and having done this, prevention may perhaps be suggested. The animal when first attacked is observed to walk round the boundaries of the fold, and become stupid. Purging soon commences and the patient dies. I have made no minute *postmortem* examination of the lambs which have died, but I have generally noticed that there is a collection of water round the heart, either transparent or tinged with red, and that the kidneys begin to decompose at a very early period. I had heard that the disease was caused by the lambs eating certain weeds when allowed to roam at large, consequently I had my land pared all over, and the weeds buried, the Turnips being in pits. My lambs died as fast as ever. During this time there were some very sharp frosts, and the Turnips in the pits were a little frozen. Thinking that it was the milk of the mother which caused the disease, I have sometimes, when it has been very destructive, weaned my lambs very early, and I have never had the deaths so frequent afterwards. I have noticed that more deaths occur after a frost, and have thought that frozen Turnip-tops or frozen weeds, taken into the stomach, is one of the causes of the disease. I have, therefore, shut my lambs in the fold at night, not allowing them to run out until after the frost is gone in the morning. When this system of management is adopted, deaths are not near so numerous. The present knowledge of the disease, of sheep is very imperfect, and the sooner agriculturists and agricultural societies stir themselves in this important particular the better. *C. B.*

[The disease described is probably induced by hoar frost, the system being chilled by lying on the cold damp ground, or by taking internally food covered by hoar frost. The collection of fluid in the pericardium indicates disease of the serous membrane which invests the heart. The rapidity of the disease precludes treatment, but care should be taken to prevent the lambs ranging over the Turnip greens, until the influence of the sun has removed the effects of the frost. In addition to this, we would recommend a moderate supply of the soft American Linseed-cake, say a quarter of a pound to each lamb, given early in the morning, so that the little animal should have its hunger appeased by this nutritious and heat-producing food, which will prevent the too rapid consumption of the greens, and neutralise their ill effect. Rock salt should also be kept in the troughs. *W. C. S.*]

Barley.—In your leading article of March 18 you express a fear that over-active farmers may suffer from having planted their Barley early in this month; it may reassure them to know, that for the last 20 years I have never willingly sowed mine after the first week in March, and that in 1850, 1851, 1852, and 1854 I have put it in at the end of February, and in the three first mentioned years have reaped more than eight quarters per acre. I was led to such early sowing by finding the quality of the corn more level, and the straw stiffer, and consequently my Clover less injured by a heavy crop than when it is sown late. You likewise recommend cross ploughing for Mangold Wurzel at this time. My experience of 30 years as a grower of Mangold Wurzel has led me to manure my land as early in the winter as I can find suitable weather, and plough the manure in as soon as I can afterwards, and sowing upon the stale furrow. If the seed is sown too deep, it does not vegetate on my land; and if the soil is light from a recent ploughing, the seed is apt to be dry. These observations apply to a well-drained land on the new red sandstone formation. The subject of covered fold yards is exciting considerable interest, many of us having found our manure injured by the wet of 1853. I think many of your subscribers have adopted the plan, and if they would communicate their opinion of it after three or four years' experience, it would help your readers to form an opinion of its value. I should like also to hear the opinion of those who, having seen it adopted by their neighbours, do not wish to put it in practice on their own farmsteads. *Charles Paget, Ruddington Grange.*

Stoppage of Drains.—In reply to an inquiry, at p. 157, I beg to state that there is not a perennial flow from the drains adverted to. They run for eight or nine months of the year; but during that portion of the year when evaporation goes on most rapidly, they are almost or altogether dry. As soon, however, as the land becomes once more fairly saturated by heavy rains in August or September, they begin to flow again, and continue doing so, more or less, for some eight or nine months again. I have had an opportunity, since my last communication, of tracing roots of an Equisetum (I believe E. arvense, perhaps sylvaticum) almost down to the tile. The last 3 or 4 inches had been broken away by the tool employed in laying the tile bare, and, from a slip near the same place, I was enabled to observe countless fibrous roots of different Grasses (a species of Carex, &c.) hanging down in various lengths, from 4 or 5 inches to as many feet. I have since heard of other similar instances of stoppage at Ayton, in this county. *A.*

Labourers, Servants, and Others.—We are well aware that in this free country much distress is produced by persons emigrating from one place to another, without being known and without a certificate from parties known to those who may be in want of men; strangers are generally treated with much suspicion who possess no recommendation, and are generally considered mere trampers, although having the best of characters from whence they came; now, as the law of settlement is about to be altered, a clause might be introduced that, when a man might wish to leave his native county and come to London, for instance, that he would first apply to the head of the police of that district, and obtain a certificate of honesty, so that when he came to London a total stranger he could apply to any other police-office, and when the thing became generally known plenty of masters would, at all times, be ready to engage them. I am aware that, in the country, men meet no difficulty in engaging with new masters—not so in towns, as employers are obliged to be much more particular about a stranger, however honest he may be. I too well know that many an honest man, trying to better his condition, and moving to where he is not known, is very often at starvation's point before he gets employment, and too often is it the case that he is obliged to go back again from whence he came, merely for want of a certificate from a public body: good men are always wanted in and around London. *James Cuthill, Camberwell, London.*

Wheat Bread.—"A Country Housekeeper" is informed that wheaten bread, if made of good sound flour and fresh barm, will always keep for a week, even when fermented by brewer's table beer yeast, well washed to take off the bitterness, and then strained through sweet bran; in fact, if all the water used in making up the dough were passed through miller's bran, the fermentation would be much assisted. Our proportions are 6 quarts of water and 28 lbs. of the best grist, or "one way" flour for a week's bread. German yeast imparts no bitterness, and we recommend it in preference to either brewer's barm or that substitute which is known as patent yeast. German yeast will keep for several weeks in cool temperate weather, but is apt to fail in the height of summer if a moist heat of 75° to 80° prevail. We believe that if a little of it were added to a quart of rich malt sweetwort, without hops, a fresh barm might be weekly made at home. German yeast is sold here at 1s. per lb.; 2 oz. of it are added to 3 pints of lukewarm water to make more than two 4 lb. loaves. In setting sponge, the flour is placed in a pan or bread trough; in the centre of it a cavity is made with the hand, large enough to contain the diluted yeast, and with this so much of the flour is worked up as will produce a good batter; the vessel is then set sloping before a fire in cold weather, and covered with a flannel. When the sponge is active and rises over the level of the flour, they are to be thoroughly incorporated and kneaded to a compact dough, adding more bran water if required; when the mass rises and becomes active it is placed on a floured board, and made up into loaves. Salt, according to taste, must be dissolved in the water. *J. T.*

Agricultural Labourers.—In the last number of the *Agri. Gazette* your correspondent "G. S." says, "It has been the professed object of philanthropists and political economists, from time to time, to ascertain the cause, and if possible to find a remedy, for the degraded state of the agricultural labourer," &c. I have just been reading a little work by W. B. M'Pherson, published three or four years since, "On Planting and Improving Estates, and the Condition of the Agricultural Labourer," and I send you a short extract from it, which perhaps will in some measure meet the case, as "G. S." puts it.

"Independent of ornamental planting, how many thousand acres of land, now lying waste, might be made profitable, that at first sight is considered not worth the breaking up; yet it would be found, if properly done, that the outlay would soon be repaid, and the ground, if planted with Larch, would in a few years considerably more than cover all expenses, and in many cases leave the ground fit for agricultural purposes. The want of employment for the labouring poor ought also to be an inducement to carry out such improvements; which would be like casting bread upon the waters. Much has been said and written to better their condition, but the most certain way will be by finding them employment in productive labour; the sum paid in this way is better for them than double the amount in the shape of charity. The able-bodied labourer is satisfied if he finds constant employment, but idleness is his bane; the former extinguishes the torch of the incendiary, snaps the wire and rots the nets of the poacher, while want of employment gives rise to every vice an uneducated mind is capable of receiving. The apparently distinct caste to which the agricultural labourers belong speaks loudly in their behalf, and must forcibly appeal to our sympathy. Located apart from large cities and manufacturing towns (whose inhabitants possess every means of obtaining useful and interesting information), confined almost to one particular parish, they seek no further knowledge than the simple education obtained in early youth; and, as their wants are but few, and they have no acquired tastes, they are content if in employment, nor trouble themselves about political affairs or agrarian laws. Surely, then, it is the duty of those who are in possession of the soil to make this most useful class of beings happy, without whose exertions the machinery of the manufacturer must lay idle—as the first call of nature is for food. If, in the endless chain of animated beings, the link that connects the agricultural labourer with his master has become weakened, it behoves all classes to assist in strengthening the same; or it may, by its disunion, seriously affect the bond of society. Most farms would be much improved by grubbing wide hedge-rows, filling up useless ditches, irrigating meadows, and deep-draining arable lands; money expended in this way would be far better than in heavy poor-rates. Next to employment, their dwellings and gardens should be considered. The allotments of garden-ground should be as near to their cottages as possible; one-fourth of an acre attached thereto is better than double that quantity at a distance; and this ought, in the first instance, to be planted with a few good fruit trees and other little matters, the cost of which would not exceed 40*s.*, but which sum it would be out of their power to pay. Those that have witnessed the distribution of the prizes to the competitors at the provincial fruit and flower shows (at which the cottager has been allowed to exhibit), must have been convinced that much good results from this practice."

J. E. S., March 20.

Societies.

ROYAL AGRICULTURAL SOCIETY.

Weekly Council, *March* 23.—Mr. Pusey, President, in the chair.

Gelatinous and Saline Manures.—Mr. Tuckett, of Lonco, near Looe in Cornwall, communicated the results of trials undertaken by him for the conversion of fish-offal into manure; and a statement of his mode of reducing animal substances, in the course of three hours, into a pulp or jelly, preparatory to its being diluted with water for the liquid-manure drill, or mixed with a fine powder for drilling with seeds. He also referred to the plan he employed for separating the chief manuring elements from gas-liquor, by saturating it with common salt, and then filtering it through a layer of powdered peat-charcoal, mixed with two-thirds its quantity of dried clay, ground. Mr. Tuckett at the same time offered a suggestion, that search should be made on the north coast of Africa, especially in Tunis, for deposits of the nitrates of potash and soda. He thought the present time was favourable for such inquiries in districts under the Mohammedan rule; and he cited various extracts from Dr. Shaw's travels in those regions, showing the natural fertility that had from time immemorial subsisted in certain districts, from no other apparent cause than that of the strong nitrous impregnation to which the soil was constantly subjected. The President took that opportunity of communicating the following statement transmitted to him by Mr. Dyce Nicol, to whom it had been addressed by that gentleman's overseer in Kincardineshire:—

"The land on which the following experiment was made was a peat bog reclaimed in 1850, thoroughly drained, and six inches of clay applied over the whole surface; the only crops raised upon it had been Oats, Turnips, and again Oats sown out with Grass. In March last I sowed on one portion of the new Grass 2 cwt. o nitrate of soda with 1 cwt. of salt; on another portion 4 cwt. o

guano, and on the remainder of the field no manure was applied. The nitrate gave per imperial acre 300 stones of hay,

at 9*d.* per stone of 22 lbs.	£11	5	0
Guano gave 270 stones, value	10	2	6
Nothing gave 140 „ „	5	5	0

"Independently of the increase of weight of hay from nitrate, I prefer that manure for either new or old Grass, as it appears to require little moisture to put it down to the roots of the plants. A strong dew in the course of one night appeared sufficient for that purpose, and in about 36 hours after its application the Grass turned to a luxuriant dark green colour, whereas the guano requires a good shower of rain to put it down; unless it gets such fall of rain, it does little good. My trial of nitrate on Oats and Barley last year leads me to prefer guano for these crops. I applied 1½ cwt. of nitrate on one portion and 3 cwt. of guano on another, but the Oats top-dressed with nitrate kept a bluish sort of colour throughout the season, and did not ripen equally, and the ear soft; while those which had guano ripened equally, had a harder crisper ear, and weighed better. The land upon which that experiment was made had not been previously cropped, and was of a mossy loam with a mixture of clay."

Mortality among Lambs. — Communications were read from Mr. Dorrien, in Sussex, and Mr. Creswell, in Leicestershire, on the subject of mortality among their lambs. The case of Mr. Dorrien was considered to be an ordinary one, but that of Mr. Creswell new both to the shepherds and to Professor Simonds. The following statement was read from Mr. Creswell, and Professor Simonds was directed to inspect these lambs, and make a report upon the circumstances under which the mortality was taking place, and might in the best mode be prevented.

"Ravenstone, Ashby-de-la-Zouch, March 20, 1854.

"I have been sadly puzzled by my sucking lambs having sore mouths; the affection begins generally in the roof of the mouth and gums, and becomes so bad that the lambs will not suck, but in a few days die. I lost three in one night. My lambs are high-bred Leicesters, and of course are very valuable. In some instances the mother's udder catches the complaint, and I have lost one of them. I have tried alum and borax, but without any good result: I am now trying nitric acid, diluted with water. In a *post-mortem* examination, we find the covering round the heart very much diseased, and the lungs partially so. Of course we drench the lambs with milk frequently, and I have dosed them all with castor oil."

This communication led to the expression of various opinions and results of experience on this subject, especial reference being made to the disease in the joints, arising to sheep pastured on the black blowing sands of Norfolk, especially about Thetford, after they had been recently marled.

The President, Prof. Simonds, Mr. Raymond Barker, Mr. Fisher Hobbs, Mr. Druce, Mr. Paine, Prof. Way, Mr. Cavendish, Sir John Johnstone, and Mr. Caird having expressed their opinions on the communications then made to the Council, Mr. Raymond Barker read a letter on adulteration of oil-cake; and Mr. Wrench, a statement on the character of the Mustard seed employed as a condiment in this country.

Adjourned to March 29.

Flax Society: Belfast, *March* 1.—A communication was read, notifying that the Treasury had directed the payment of 1000*l.* for the Society's account, to be expended in the practical instruction of Flax-growers in the counties of Cork, Kerry, Clare, Tipperary, Galway, Mayo, Sligo, Leitrim, and Roscommon, in certain proportions recommended by the Society. It was ordered that as many of the instructors as were necessary should be forthwith sent to superintend the preparation of land for the sowing of Flax. Allusion was made to the great encouragement that existed in the prospect of high prices for Flax to farmers who would sow it this year; and it was hoped that, as the Irish press had given considerable prominence to the facts on which this anticipation was founded, farmers would recognise the soundness of the advice given, and not allow the present dearness of grain to induce them to give it a preference over Flax, since all kinds of food were pretty certain to be much cheaper next harvest, while Flax was equally certain to maintain its very high value.

Farm Memoranda.

Lord Radnor's New Farm Buildings.—These buildings were planned by Mr. Moore, Lord Radnor's intelligent agent, who resides on the estate, and were executed by Mr. Pedley, of Highworth, under the superintendence of Mr. G. Lamb, architect, of London. With the exception of the Duke of Bedford's, they are, perhaps, the most extensive in England; but in arrangement and completeness, in perfect adaptation to the purposes required, they are second to none. They are placed on the west side of the mansion and park, just without its boundary, on the slope below the entrance to Mr. Moore's residence, occupying the space between that house and the garden attached to it, and the highroad leading from Highworth to Faringdon. They cover, with the courts and yards belonging to and forming part of them, about 3 acres of land, and are approached, on the Highworth side, by a private road leading round the west and south sides of the buildings, and on the Faringdon side, by the entrance just above-mentioned, thus being entirely surrounded by a road—public on the north side, and private on the east, south, and west. They are built of rough stone, and covered in part with slate and in part with stone-tile, forming a substantial and imposing-looking mass of building, and presenting a striking appearance when viewed from the west, on descending the hill leading from Highworth.

So much for the exterior. Inside, the partition walls are of brick, but some of the yards are divided, and enclosed from the passages, by thin slabs of stone set up on end, and capped on the top by wooden rails, to which they are clamped. The cattle boxes and stalls are divided one from another by Oak posts and rails, each box and stall being fitted with a rack and a manger on a level with each other, and with a trough for water, which is supplied, pure and fresh, from a natural stream which is turned in at the upper or east end of the premises, and is conveyed through them—each trough being filled from a separate tap. The surplus water is carried off into the rain-water tank, adjoining to the liquid manure tank, and being first strengthened by an admixture of liquid manure, is intended to be conveyed by underground pipes (not yet laid down), to irrigate a field of Grass containing about 10 acres, lying at some little distance to the west of the buildings. The principal entrance to these capacious and complete premises is at the east end, through a pair of folding gates, and down a wide and well-made road, which divides the rick-yard or barton from the timber-yard, the former being on the right hand and the latter on the left. These yards occupy the upper end of the farm premises; and the barn, stables, boxes, and sheds, and other buildings the lower end. There are two other main entrances, one at the south side and the other at the south-west corner; and the boundary of the whole is either the exterior walls of the buildings, or a stone wall 6 or 8 feet in height. The whole forms a long square, the corners of which at the lower end are slightly rounded off, as well for the sake of convenience in using the road which surrounds the premises as of appearance. Such is the general outline of the whole.

On entering the buildings, and the adjoining rick and timber-yards, which you do at the east end, you find yourself in the barn, and in the upper story of it—for it is two stories high, the upper story being on a level with the rick-yard, and the lower on a level with the floors of the stables, cattle-sheds, and yards. This difference in the levels is caused by the site being on a declivity, which has been most judiciously taken advantage of, and by a little extra labour divided into two steps or flats, each with a very slight incline downwards, towards the west. The convenience of the premises is increased by this difference in the levels, and the difficulty which the rather steep incline of the whole presented at first is entirely got rid of, and turned into a favourable circumstance by this mode of dealing with it. In this upper story of the barn is placed part of the machinery connected with threshing and dressing the corn, weighing and sacking it; also a mill, with a pair of French stones, for grinding Wheat or other grain, either into fine flour, or for merely crushing it or kibbing it. There is, too, a mill for grinding Linseed. Opening from this large floor is, on one side, a spacious granary, from which the corn, when dressed and sacked, can be let down, through a trap-door, by a chain and pulley, into the waggons, to be conveyed away when sold. It opens also into the engine-house, and into a large loft for storing wool or anything else that requires to be kept dry. The threshing-machine, which, with all the other machinery, mills, chaff-cutters, &c., is driven by a steam-engine of 7-horse power, is placed on the ground adjoining to and on the same level with the upper floor of the barn, as is also a circular saw for cutting out rough stuff, which is likewise worked by the engine. All this machinery, including the steam-engine, was made and erected by Messrs. Clayton & Shuttleworth, of Lincoln, and for finished execution and smooth and easy working is equally creditable to them and satisfactory to their noble employer. It is composed of various machines by which the grain is threshed, dressed, deposited in sacks, and weighed, ready for market at one operation, without any intervention of manual labour. This is effected by its first passing into the threshing machine, which also performs the operation of shaking the straw after it is threshed, riddles the corn out of the straw, and also winnows the "caving" from the grain, which then passes to elevators, and is raised a certain height, where it is deposited in a Barley-horning machine, which is used to considerable advantage with all descriptions of grain, by rubbing, and thus cleaning its surface and improving its appearance. From this machine the grain passes into a dressing apparatus, which effectually cleans and separates the good corn from the light and inferior quality, and finally deposits the former in a sack on a weighing machine, and when the proper quantity is deposited, by a simple mechanical contrivance, the descent of the beam of the weighing machine shuts the supply valve, and rings the call-bell, which summons the man in attendance to remove the full sack and replace it with an empty one. There is also a mill on an improved principle for grinding corn for cattle; also a chaff-cutter; a mill for bruising Oats and Linseed; a saw-bench with circular saw, &c., in the carpenter's shed—all of which are driven by a 7-horse power portable steam-engine outside the barn wall, which communicates the power to a line of shafting extending across the barn, from which the various machines are driven by leather bands. Upwards of 50 quarters of Wheat can be threshed and dressed by this machinery in a day of 12 hours, at a consumption of not more than 7 to 8 cwts. of coal, and requiring about seven or eight hands, more or less, according to circumstances. The straw is not seen at all in the upper part of the barn, for it passes down from the threshing-machine, on a sort of riddling screen, to the ground floor below (where the chaff-cutter is placed), either to be converted into chaff or to be stored away in the straw-house. Following it, by a staircase, which leads down to the ground floor, which is on the second flat or step of the area of the premises, you find yourself in a commodious building, with large doors, north and south, large enough for a loaded waggon to pass through them. This building is appropriated for receiving the caving, chaff, and straw when cut for litter, being divided into separate rooms; the north end being reserved for the purpose of storing roots which are thrown in from the upper level through a shute provided for that purpose. The adjoining rooms are fitted up with various apparatus for steaming and preparing food for pigs and cattle, and comprise, as well, vaults for skim-milk, wash, &c., and a slaughter-house. On leaving this building by the south door, you enter a court in which, on your left hand, are the riding-horse stables, coach-house, harness-house, &c.; and above, and adjacent to them, the steward's office, room for reckoning with the men, &c. On your right hand is the building containing the boxes and stalls for the dairy cows, and the yards and sheds for these cows and their offspring, and for young stock. On leaving this building by the north door, another court is entered, which is surrounded by sheds for carts, ploughs, and other implements — by the cart-horse stables, harness-houses, &c.—and by the yards attached to some of the boxes for fatting cattle. In this court, in the centre of which stands a fine Elm tree, the poultry houses and yards are to be placed.

Returning to the centre of this building—that is, to the spot, or near to it, where the straw from the threshing machine comes out from the apparatus above—and turning your face to the west, you look down a long vista, flanked on one side by the piggeries, and on the other by boxes for fatting cattle. The roof is of slate, with skylights, glazed with rough plate glass, and open at the sides, which are fitted with ventilators. The roofs of the other avenues and of those parts of the building where the stock is kept confined are lighted and ventilated in a similar manner; thus every part of the place wears a light and cheerful appearance, and as there is free escape for all impure exhalations from the cattle and the litter, and as powdered gypsum is scattered about when and wherever necessary, the building is entirely free from any unpleasant smell. In the centre of this covered path, or main avenue, is a tramway which runs down to the tanks, and is to be continued on into the sheep-house, which is placed at the bottom, at the extreme west end. On passing along about two-thirds of this avenue, you come to a turn-table on the tramway, the line being intersected here, at a right angle, by another avenue or transept, on which also a tramway is laid, which runs across the building from north to south, and on each side of which are cattle-boxes—the south end of it running into the building containing the boxes and stalls for the dairy cows. Leaving the main avenue at its western end (at the tanks), you cross a yard and enter the sheep-house, a spacious building at the extreme west of the premises, with an open railed floor, and pits underneath for the manure. Here there is ample room for about 400 sheep, for 250 or 300 ewes, and for 100 fat sheep, which latter are tied up at rack and manger. Right and left of this sheep-house and of the open yard between it and the tanks and manure shed, and occupying the south-west and the north-west corners or wings of the premises, are sheds and yards for young cattle, for 30 head of which there is ample room.

Returning from this point, and reaching the turn-table, you have, right and left, and before you, the cattle-boxes, 44 in number, intended for the use of 30 large beasts, each occupying an entire box, and 28 young beasts, standing 2 in a box. Turning to the right, you pass along the south branch of the transept, with cattle-boxes on each side of you, till you enter the cow-house, which occupies the centre portion of the south side of the premises. Here is room provided for 30 dairy cows, 20 in stalls, tied up, and boxes for 10, intended for the calving cows and their offspring. Attached to this department is the cow-yard, constructed to accommodate 14 cows, with room for 20 calves, on stages and boxes. There is also provision made for tying up 12 beasts, on the old stall-system, and for 4 bulls—2 old and 2 young ones. On turning to your left, at the turn-table, on coming away from the sheep-house, you pass between the other end of the double row of cattle-boxes, and come out into the yard in front of the row of buildings composing the cart-horse stable (for 12 horses, with 2 loose boxes), harness-houses, sheds for implements &c., &c.; these occupy one side, the north side of the yard; the west side being occupied by sheds, and enclosed yards for young stock, colts, and for other purposes.

The piggeries—which, of course, are not forgotten at a place which has give its name to the handsomest and most approved breed of white pigs in the country—are placed, as stated at the commencement of the description of the part of the buildings devoted to the reception of cattle, on your left hand, as you proceed westward down the main avenue. They contain boxes, walled in, for 8 breeding sows and their young, for 2 boars, and for a score of fat pigs; each box having an inner and an outer compartment, or rather having an open yard attached to it, so that the inmates can enjoy themselves in the open air or under cover at will.

From the above general description a tolerable idea may be gathered of the nature, extent, and capabilities of these buildings; but to be able fully to comprehend and to appreciate their utility and perfect completeness, a personal inspection is necessary. *Abridged from the Wiltshire Independent.*

Reviews.

A Guide to the Eastern Escarpment of Dartmoor; with a Descriptive Map.

This pamphlet, which we owe to the local knowledge, antiquarian zeal, and geological attainments of Dr. Croker, of Bovey Tracy, is an interesting guide to the

beauties, antiquities, and geology of the district it describes. It does not refer to the agriculture of the neighbourhood. We extract the following description of the Bovey coal, which will be read with interest:—"The coal or lignite is found towards the northern margin of the heathfield; the uppermost strata rise within a foot of the surface, under a sharp sand intermixed with an ash-coloured clay; they underlie the latter towards the south-east, about 1 to 5 feet. The perpendicular thickness of these strata, including the beds of various coloured sandstone clays, is about 80 feet. The principal deposit takes a south-east direction, in the anticlinial line of the valley at an angle of 25°, through which coal is found more or less amongst the clay beds, but not of sufficient thickness to work. There is no doubt that the Bovey coal has a ligneous origin; it consists chiefly of the trunks of exogenous trees, and well marked appearances of branches and compressed vegetable matter. In one layer, seeds have been found, and within a few feet of the surface, in loose coal, a mass of Fir cones of the Pinus sylvestris. There are various kinds of the coal, some charred with a pulverulent charcoal, heavy black coal highly bituminous, and sometimes containing pyrites. Until lately it could only be made to produce a red heat, sufficient for the first burning of the earthenware, which in this state is called 'biscuit ware.' The fixing of the glaze or enamel, in the second burning, had been hitherto produced by the white heat of the mineral coal of the North of England; but now, by the perseverance and ingenuity of Messrs. Buller and Divett, the present proprietors of the Bovey potteries, the lignite can be made to afford a degree of white heat, sufficiently high to vitrify the finest porcelain ware."

Modern Husbandry; a Practical and Scientific Treatise on Agriculture, illustrating the most Approved Practices, &c. By G. H. Andrews, Esq., C.E., late of Fleet and Brook Farms; author of "A Treatise on Agricultural Engineering." Nathaniel Cooke, Milford House, Strand.

THIS is a systematic work on the whole subject—aiming, we presume, at greater cheapness than some of those already published, and at greater attractiveness, if we may judge from the number and character of the illustrations.

There is a great deal of matter in the work which may, of course, be already found in previous publications of the class to which it belongs; and we should have doubted the policy of adding to the number of such works, though the progress of the art has certainly been sufficient, in some of its departments, to render general pictures, such as these works convey, sufficiently distinct from one another when taken at any considerable interval of time. The department in which farming has of late years most extended is precisely that which the author of this work was best qualified, by professional experience and education, to delineate, and accordingly on all matters relating to the architecture, the engineering, and machinery of the farm, Mr. Andrews's volume is more than usually full. In other respects—in the artistic rather than instructive character of the illustrations—in the introduction of historical and general information, when the barest detail and baldest statement of fact would have better filled the space—and in the use of general and qualitative terms instead of information as to quantities, places, prices, which is what the reader wants, we consider the volume, as far as we have examined it, to rank below such works as Low's "Elements of Practical Agriculture," Stephens's "Book of the Farm," and others.

POULTRY.

Arabian Pigeons.—In your No. of February 18, 1854, your correspondent "J. E.," in describing Arabian laughing pigeons, states that they "are a clear white, feathered legs even to the end of the toes, with feathers on the back of the head." In this description he is right, but I beg to say they are also blue, red, and mottled; some are also clear legged and without the feathers on the head. I bought two pairs when in the East, neither of which had feathers on their legs, or those turned on their heads; and when I asked the Arab the reason, he said some have them and some have not. I, however, did not believe him; but to my surprise, when they lived in the East, one pair came with this turned crown, and the other plain. I have since in England, from the same pair of pigeons, bred them plain and turned crowned and rough legged (I mean feathered). They are mixed very much by the Arabs, and are certainly very curious pigeons in the sounds they make, and my friends admire them very much. *J. E. S.*

Notices to Correspondents.

ADDRESS: We must, unfortunately, ask "J. L." again to forward his address.

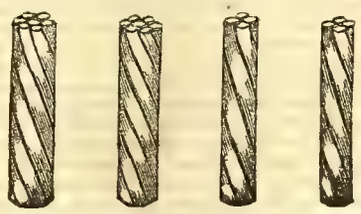
BOOKS: *S T.* "Gibson's Land Surveying."

PEAT FOR KILNS: *J R* asks for information, founded on experience, as to the utility of wood or peat as a substitute for coal in the burning of lime or drainage tiles, particularising the proportions of each to produce a given heat. The articles "Bricks" and "Tiles" in "Blackie's Cyclopedia" give information on the general subject of burning these articles.

SALT: *J Scott.* The quantity that may be applied without risk of injury varies with the lightness of the soil; 4 to 5 cwt. may be applied on light soils, and 2 cwt. is enough on a clay.—*E J W.* You must stop your bailiff, or you will kill everything; 10 cwt. per acre is the most we ever heard of, and 4 cwt. more than we ever used.

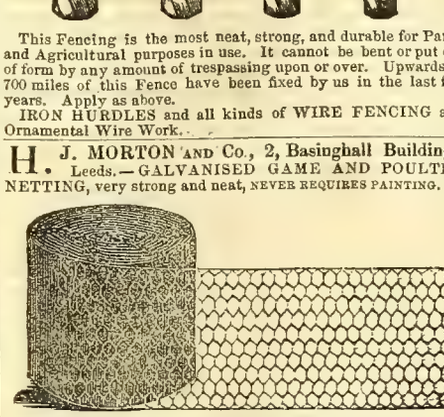
UNSOUNDNESS IN A COW: *Esher.* The question is too indefinite; if the unsoundness relates to the structure of parts it cannot be removed, if to their functions it may. In either case it may possibly be alleviated. *W C S.*

H. J. MORTON AND Co., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.
PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.
IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

H. J. MORTON AND Co., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4½*d.*, 6*d.*, and 8½*d.* per yard.
24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.
GALVANISED IRON SPOUTING, for Dwellings, Cottages Farm Buildings, &c., NEVER REQUIRES PAINTING.
Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, *&c.*

GALVANISED WIRE GAME NETTING.—7*d.* PER YARD, 2 FEET WIDE.

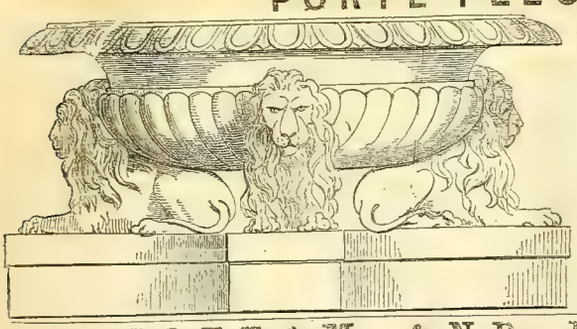
Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

PORTE-FLEURS.

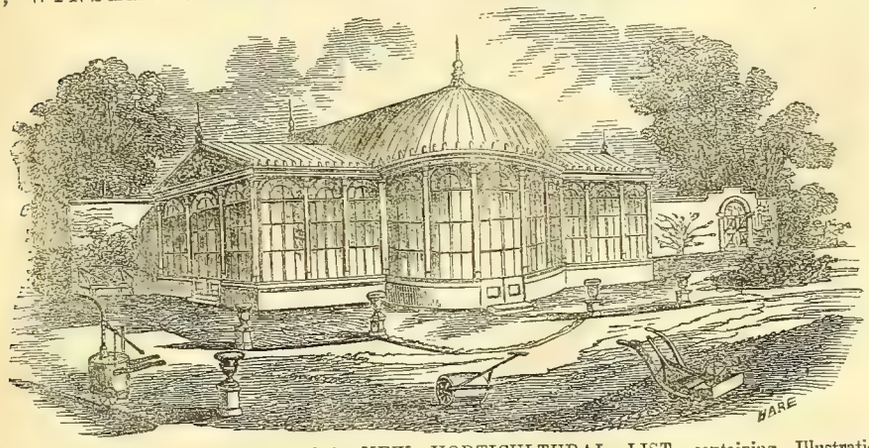


J. SEELEY respectfully informs the nobility and gentry that he has many handsome Designs for large Flower Bowls, and he solicits orders for them at the present time, for the purpose of insuring their being made before the summer is too far advanced—at least, two months is necessary to prepare such work; and he therefore trusts that gentlemen intending to place such ornaments in their grounds this year, will favour him with their instructions without delay.

ARTIFICIAL STONE WORKS,
Nos. 1 to 4, KEPPEL ROW, NEW ROAD,
REGENT'S PARK, LONDON.

N.B. A large quantity of Garden Vases and Figures, which have stood exposed to the last winter, may be inspected.

COTTAM AND HALLEN,
2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.



APPLICATION is requested for their NEW HORTICULTURAL LIST, containing Illustrations, Descriptions, and Prices of

Conservatories	Mowing Machines	Hand-glass Frames	Garden Engines	Flower Sticks

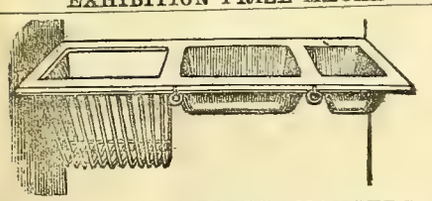
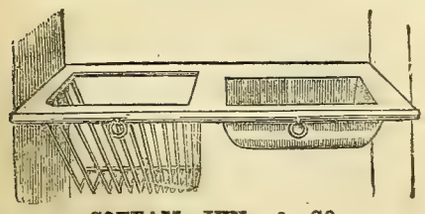
Hot Water Apparatus	Ornamental Wire Work	Hurdles	Do. Rollers	Watering Pots
Garden Vases	Flower Stands	Garden Chairs	Flower Labels	Garden Arches, &c.

IRON HURDLES, STRAINED WIRE FENCING, GAME NETTING, &c.
AGRICULTURAL LIST UPON APPLICATION.
EVERY DESCRIPTION OF PLAIN, ORNAMENTAL, CAST AND WROUGHT IRON, AND WIRE WORK.
EXHIBITION PRIZE MEDAL GATES AND ENAMELLED MANGERS.



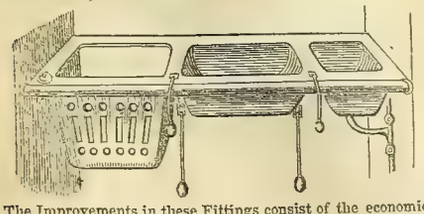
COTTAM'S ENAMELLED MANGERS.—(Registered.)—To this article was awarded the Great Exhibition Prize Medal. No stable should be built or re-built without having these Mangers, which have the following advantages over those generally in use, viz.: Cleanliness, comfort to the horse whilst feeding, economy, appearance, and being impervious to any infection. Every kind of stable furniture kept in stock. The new designs are registered.
COTTAM and HALLEN, 2, Winsley Street, Oxford Street.

PATENT ENAMELLED MANGERS.



COTTAM, JUN., & CO.
33, CHARLES STREET, HAMPSTEAD ROAD, LONDON.
THESE MANGERS possess all the Latest Improvements, and can be had Plain, Galvanised, or Enamelled, and fitted as Manger-rack and Water-trough—Manger and Rack, or Manger only. Stable Fittings of every description; Hurdles, Strained Wire, and all kinds of Fencing.
33, Charles Street, Hampstead Road.

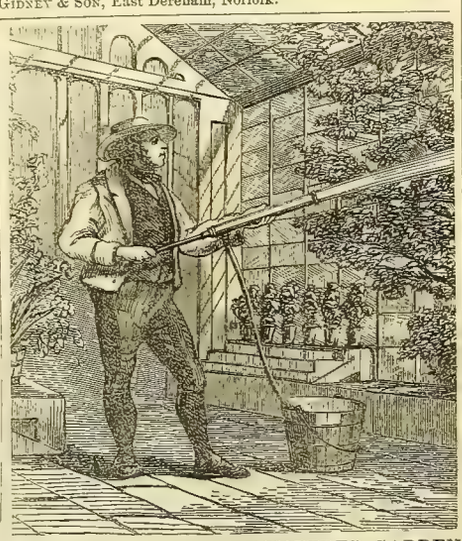
BARTON'S PATENT STABLE FITTINGS—PLAIN, ENAMELLED, AND GALVANISED.



The Improvements in these Fittings consist of the economical ventilating Hay-box, the front revolving Guard-roller, and the superior manner of working the Halter-balls and removing them away from the horses' legs; these, together with the compactness of the general arrangement and superior workmanship, render them indispensable to all desirous of the most perfect and economic Stable Management. Stable Furniture of every description. Iron Gates, Railing, Strained Wire Fencing, and Hurdles: Sheep, Poultry, and Game Wire Netting; Registered Poultry Fountains, Troughs, Feeders, &c.
JAMES BARTON, Ironmonger, &c.; Manufactory and Warehouse, 370, Oxford Street (a few doors east of the Pantheon), London.

BUDDING'S LAWN-MOWING MACHINES, with Registered Improvements.
MAPPLEBECK & LOWE, MACHINISTS & MANUFACTURERS, Birmingham.

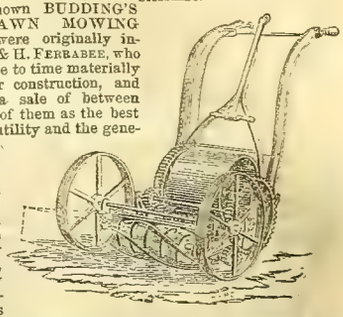
GIDNEY'S PRUSSIAN HOES.—Gardeners and Amateurs are informed that this useful Tool is now becoming a general favourite in the garden, and only needs a trial to be appreciated. Price 1*s.* 6*d.* handled. To be had of every Ironmonger and Seedsman. Manufactured only by GIDNEY & SON, East Dereham, Norfolk.



J. TYLOR AND SON'S REGISTERED GARDEN SYRINGE.—By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. Price complete, with India-rubber suction tube, with galvanised spiral inside, and covered with cotton outside, 25*s.* each. To be had of any respectable Ironmonger or Seedsman in town or country.

J. TYLOR & SONS, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

THE IMPROVED LAWN MOWING MACHINE,
MANUFACTURED BY
J. AND H. FERRABEE, Phœnix Iron Works, near Stroud, Gloucestershire.



The well-known BUDDING'S PATENT LAWN MOWING MACHINES were originally introduced by J. & H. FERRABEE, who have from time to time materially improved their construction, and can refer to a sale of between 4000 and 5000 of them as the best proof of their utility and the general satisfaction which they have given.

The Machines offered this year by J. & H. FERRABEE are superior to any yet produced, being perfectly adapted for cutting the Grass on Lawns and Verges, and between flower beds; while their strength and durability have been increased and their management simplified. Any person can use them effectually without the least practice. They can be adjusted to cut various lengths of Grass, and will produce a more even and uniform surface than the most skilful mower. The Grass is cut best when dry, so that a machine can be employed at the most convenient time to the workman, and more than double the work may be done with the same manual labour that is requisite with a scythe.

SIZES AND PRICES.	£	s.	d.
Hand Machine, for One Man, cutting 16 inches wide	5	15	0
Ditto for Two Men, „ 22 ditto ...	6	10	0
Pony Machine, „ 28 ditto ...	10	0	0
Horse ditto „ 36 ditto ...	16	0	0

The Horse Machine will cut the longest and coarsest Grass usually met with on Lawns and Pleasure Grounds.
London Agents:—Messrs. BOULNOIS & SON, Baker Street Bazaar, Portman Square.

JOHN WARNER AND SONS,
CRESCENT, JEWIN STREET, LONDON.
GALVANISED IRON TUB GARDEN ENGINE,
With Warner's Registered Spreader

Is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes made either in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Syringes of various constructions and sizes from 9*s.* upwards. An extensive assortment kept.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d.
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,
8, CRESCENT, JEWIN STREET, LONDON.
Every description of Machinery for Raising Water; Fire Engines, &c.

An Illustrated Book sent on application post free.

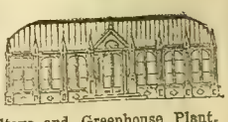
HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea.

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.



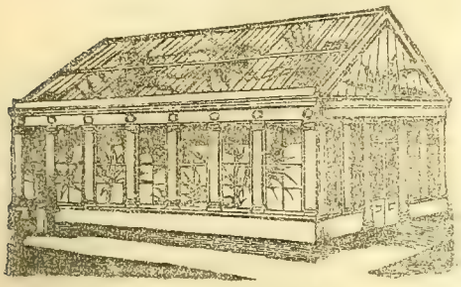
The splendid collections of Stove and Greenhouse Plant, are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application
J. WEEKS & Co., King's Road, Chelsea, London.

GREEN AND HOTHOUSES made by machinery at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Warranted of best materials; being made by steam-power, they are put together in a superior manner; one trial will prove these Buildings to be the cheapest and best made in England. 1½ in. Greenhouse lights at 3*d.* per foot; 2 in. at 4½*d.* per foot. Lists of Prices by enclosing two postage stamps.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

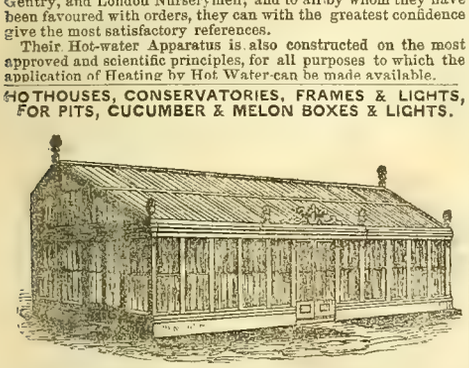


GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS, FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.



JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in. 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and, the Trade, in most of the counties in England.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

GUTTA PERCHA HORTICULTURAL LABELS FOR ROSES, SHRUBS, TREES, &c., are easily read, very elegant, and extremely durable. Price 8*d.* per dozen, INCLUDING every NAME, printed on the Gutta Percha in bold letters.

"What is wanted in a Garden Label is durability, legibility, and cheapness; and this (the Gutta Percha Label) seems to approach such requisites nearer than any we have yet seen."—*Gardeners' Chronicle.*

Sample dozens sent post free on receipt of 12 postage stamps. Sold by E. TAYLOR, Gutta-Percha Warehouse, Colchester.

ADAMSON'S REGISTERED ORNAMENTAL GARDEN EDGING, a cheap, durable, and perfect substitute for all other Edgings, for Conservatories, Terrace Walks, or Garden Borders, being of an agreeable colour, a thorough drain for the walks, applicable to borders of any form or size, and does not harbour vermin. To be obtained only of the Inventor and Manufacturer, T. H. ADAMSON, Jun., Builder, High Street, Putney, where Prospectuses may be obtained on application.

May be seen laid down in the Horticultural Society's Gardens, Chiswick, where it has withstood the late severe winter.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

A GOOD HIT FOR A YOUNG BEGINNER.

TO BE SOLD, a small GREENHOUSE, containing 30 Camellias and 10 Azaleas.—Apply to Mrs. D. WITHEM, Wimbledon, Surrey.

TO BE SOLD, a quantity of VINES, from Eyes, in Pots, three years old (Black Hamburgh).—Apply to Mr. G. FIELD, Springfield Watercress Ground, Wandsworth Road.

TO BE SOLD, about 2000 yards of superior BOX EDGING.—Apply at Mr. HEAD'S Nursery, Upper Street, Islington, London.

A GENTLEMAN about to leave for Australia, and who has had considerable professional practice in Ornamental Gardening, is desirous of Disposing of his Plans and Specifications. Rural Architecture could be very advantageously combined.—A. B., 50, Office of this Paper.

COCHIN CHINA POULTRY, ETC.

EGGS FROM PRIZE BIRDS.

MR. JOHN FAIRLIE, of Cheveley Park, Newmarket, in reply to the very urgent applications from numerous amateurs, is now prepared to dispose of a limited number of Eggs, from his celebrated prize Cochins, Brahma Pootras, Scotch Bakies, Dorkings, &c., according to the dates of the orders received.

COCHIN CHINA FOWLS.

MR. THOMAS GILBERT, of Grays, Essex, having purchased of THOMAS STURGEON, Esq., his entire breed of 1853, Gentlemen and Amateurs are informed the Birds are now on Sale, and are bred exclusively from his best Stock Birds, Jerry and Nelson. Eggs may be had at 16*s.* per dozen, from the above.

EGGS.—An Amateur has some very good Partridge, Cochin China, Dorking, and White India Game Fowls' Eggs to dispose of, at 4*s.* 6*d.* per dozen. Also, a few young Partridge Cochin China Fowls, at 1*l.* 3*s.*, and Golden-laced Bantams at 18*s.* the pair, packing included. — Address, An Amateur, Matlock Bath, Derbyshire.

BRAHMA POOTRA FOWLS.

TO BE SOLD, a few Sittings of EGGS of this breed (according to priority of application), from the prize and selected birds of a gentleman—Brahmas of whose breeding have, during the past year, taken prizes at the following important Poultry Shows: the Royal Agricultural, Great Metropolitan, Birmingham, Great Yarmouth, Doncaster, Winchester, Norwich, and Manchester.—W. C. G., Post-office, Sandbach, Cheshire.

AYLESBURY DUCKS' EGGS.

TO BE SOLD, EGGS warranted from the best selected White Ducks, good shape, bill and legs fine and a good colour, 6*s.* per dozen, including packing. Early application to secure them at the above price is necessary.—Apply to WILLIAM HENRY GREEN, Builder, Walton Street, Aylesbury.

TO AMATEURS OF THE HAMBURGH FOWLS.—A few sittings of Eggs of each class of the Hamburgh Fowls, viz.:—Gold and Silver Pencilled, Gold and Silver Spangled, and Black, to be disposed of in the spring, from birds which have taken thirty prizes at most of the principal Shows during the past season. Eggs will be supplied according to the dates of the orders received. Also, Eggs of Prize Game Fowls and Aylesbury and Rouen Ducks.—Apply to the Feeder, Mr. ROBERT HUGGINS, Beighton Rectory, Acle, Norfolk.

TO BE SOLD (WARRANTED).—PURE SILVER SPANGLED HAMBURGH EGGS, at 10*s.* per Sitting, package included, but not carriage. To be had of Mr. WILLIAM FIRTH, at Stourton, near Knaresborough, Yorkshire.

LIGHT BUFF COCHIN CHINA FOWLS' EGGS. —An Amateur having a first-rate stock of Light Buff Cochin China Fowls from Prize Birds, and more eggs than he requires for his own use, is willing to part with a few sittings at a reasonable price—5*s.* 6*d.* per doz., box included.—Address "Chanticleer," Post-office, Farnham, Surrey.

PUREST BRED AYLESBURY DUCK EGGS, 1*s.* 6*d.* per egg; Dorkings, 1*s.* per egg; beautiful Silver Cinnamon Cochin, large and well feathered, 1*s.* 6*d.* per egg; Buff Ditto, 6*d.* per egg; Guinea Fowls, 8*s.* per dozen; White Cochin, very handsome, 1*s.* 6*d.* per egg; Grey large Cambridge Turkey, 5*s.* and 5*s.* 6*d.* per egg; Nutmeg and Black-edged Feathers, 5*s.* per egg; Norfolk Black, 2*s.* 6*d.* per egg; White, 2*s.* 6*d.* per egg; Brahma Pootra, 5*s.* per egg. A pair of Brahma Pootra Chickens, six weeks, 5*l.*—Apply immediately to O. E. U. F., care of Mr. George Lees, Ashbocking, Needham Market, Suffolk.

Sales by Auction.

FANCY POULTRY—EXTRA SALE OF CHOICE STOCK.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 28th March, at 12 o'clock precisely, a SELECTION OF COCHINS from Lord Cottenham's yard; the entire brood stock of 1st Class Cochins belonging to Mr. Stainton, some good birds from Mr. Bridges, Mrs. Fooks, and others. — Catalogues by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

TO GENTLEMEN, FLORISTS, AND OTHERS.

VERBENAS, choice varieties of last year, 1*s.* each, or 7*s.* 6*d.* per dozen.

PETUNIAS, new varieties of last season, 1*s.* each.

The above selections are all strong, healthy, and well-established plants, and cannot fail to give satisfaction to parties purchasing.

PANSIES in great variety, of which H. W. possesses more than 2000 extra strong healthy plants of the best leading show varieties out, 4*s.* 6*d.*, 6*s.*, 9*s.*, 12*s.*, and 18*s.* per dozen.

H. W. has also a good collection of Hollyhocks, Dahlias, and a great variety of Bedding Plants, &c. &c., catalogues of which will be ready, and may be had for one postage stamp, in the course of a few days.

It is respectfully requested that all orders from unknown parties (unless reference is given) be accompanied with a Post-office Order, payable at Marsden, Lancashire.

JOHN HOLLAND, Bradshaw Gardens, Middleton, Manchester, is, this year, selling out his celebrated Pansy, "FATHER GAVAZZI," at 5*s.* per plant. It is allowed by all who have seen it to be the best Pansy yet raised. Three blooms of this noble flower were submitted to the Editor of the *Gardeners' Chronicle*, who thus notices them in that paper of May 21, 1853:—

"J. H., Middleton.—Your seedling is a first-class flower, and an improvement on the Duke of Norfolk."

It was also in the first stand, and had a first-class certificate awarded it at the Botanical Gardens, Manchester, May 25th, 1853. Colour deep golden yellow, top petals rich dark maroon, bottom petals margined with the same, and the belting continued evenly round, very large and fine form, solid eye.

Also the following superior SHOW PANSIES, in strong Plants, at 6*s.* per dozen, package, &c., included.

Adela—Turner	Iron Duke—Grieve

Priced and Descriptive Lists are now ready, of Auriculas, Alpines, Polyanthuses, Primroses, Pansies, Carnations, Picotees, Pinks, &c. &c., and may be had for one stamp. Post Office Orders to be made payable at Middleton, Lancashire.

FIRST CLASS NEW VERBENAS.

GEORGE SMITH, in offering the following, warrants them to give entire satisfaction; having this season raised three times the usual number from seed, and with greater success than usual, has been able to select twelve distinct and beautiful varieties, which G. S. flatters himself cannot fail to please.

CALIBAN—Rosy purple crimson, extra large, smooth on the edge and of fine form, has taken First-class Certificates at the National, Brighton, and North London Floricultural Societies.

CLIMAX—Rosy purple, eye shaded with crimson maroon, extra large, of fine form and extra fine show flower.

ANGELINA—Rosy purple, primrose eye, very large, of fine shape. First-class at the Royal Surrey Gardens.

ELECTRA—Bright lilac, fine conspicuous eye, large, of exquisite form. First-class at the Royal South London and the North London Societies.

ISLINGTON RIVAL—Bright scarlet, eye white, flower large and smooth, a free bloomer. First-class Certificate at the National, Brighton, Royal South London and North London.

NOBLISSIMA—Rosy peach, with conspicuous white eye, truss large, of exquisite form. First-class at the Royal South London, also the North London.

FORGET-ME-NOT—Lavender, with large crimson purple eye, a most conspicuous variety, of fine form, extra large and a profuse bloomer. First-class at the Royal South London, Brighton, and the North London.

TRIUMPH—Scarlet crimson, eye white, surrounded with maroon, form exquisite. First-class at the Royal South London, National, and North London.

QUEEN—Pure white, the eye surrounded with bright cherry, pip extra large and smooth. First-class at the Royal South London and North London.

SCARLET KING—Deep scarlet with white eye, fine habit, a free bloomer, flowers large, extra fine bedder.

MAGNIFICENT—A brilliant puce, of fine form, truss large, very free, surpassing all of its class, either a show or bedding var.

ZARIA—Rich lilac, dark eye, large, of fine form, an extra fine variety.

The Set of 12 for 2*l.* 5*s.*, or 6 for 25*s.*, in strong plants, about the 20th of April.

FUCHSIA "TELEGRAPH."

This splendid variety will be found an acquisition. The Plant is of fine growth and habit; the contrast is greater than in any other dark Fuchsia; the tube and sepals are smooth, the latter thick and broad, of brilliant coral red, well reflexed; corolla deep violet, of good size, and circular; quite equal to and distinct from Glory and Nil Desperandum. Strong Plants about the 20th of April, at 10*s.* 6*d.*; with all the leading varieties of Florists' Flowers. Catalogues forwarded in exchange for one postage stamp.

Tollington Nursery, Hornsey Road, Islington, London.

WM. HAMILTON, SEEDSMAN & FLORIST, &c., 41, Margaret Street, Cavendish Square, London, offers the following NEW SEEDS, free by post, for 5s.:—

New Gardens and Greenhouses furnished on moderate terms.

Albion Nursery, Stoke Newington, London.—March 25.

DILCOCK'S BRIDE BROCCOLI.

BAINBRIDGE AND HEWISON (late Jas. Edward), have the pleasure of again offering to their friends and the public their DILCOCK'S BRIDE BROCCOLI, at 2s. 6d. per packet; and while returning their thanks to their numerous patrons of last season, they beg to refer them to the following extract, taken from the *Yorkshireman* newspaper of the 30th of April last, when it was exhibited at York, for the fourth time:—"Mr. Dilcock deservedly obtained all the three prizes for Broccoli with his seedling—the 'Bride.' Taking the season into account, these vegetables were really remarkable specimens." It was equally successful the two previous years.

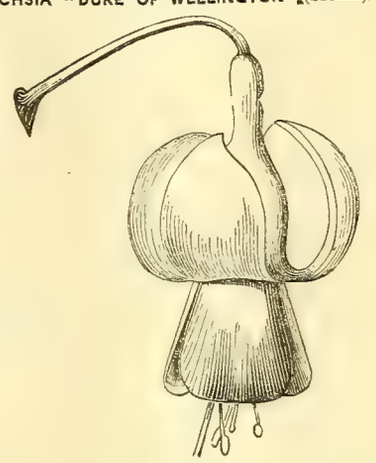
B. & H. are prepared to send out their Catalogues of Kitchen Garden and Flower Seeds, post free, on application, and also their Catalogue of Plants is now ready, containing Stove, Greenhouse, &c., including many of the newest and choicest of the season. Their Seeds will be of the very best quality, and in the greatest possible variety.

Sold Wholesale by NOBLE, COOPER, & BOLTON, Fleet Street; CHARLWOOD & CUMMING, Covent Garden; and by all respectable Seedsmen in town and country.—York Nurseries, March 11.

DOUBLE ITALIAN TUBEROSE ROOTS, 4s. per dozen.—The annual importation of the above-named beautiful and fragrant Flower has just been received, and large and well selected Bulbs may be obtained, without disappointment, at A. COBBETT'S Foreign Warehouse, 18, Pall Mall.

N.B. Printed regulations for treatment sent; also, just arrived very moist and open Parmasan Cheeses.

FUCHSIA "DUKE OF WELLINGTON" (STOKES).



Colour—sepals light scarlet; tube deep carmine; corolla rosy purple. Form—as given. Habit—shrubby, compact, and very prolific, blooming at every joint, perfectly distinct from all others yet in cultivation, and a type and groundwork for a new and much improved class.

JOHN MOORE AND SON, NURSERYMEN, Perry Barr, near Birmingham, beg to state that they are the fortunate possessors of this truly magnificent Fuchsia, and will send it out on and after the 20th of April next, in strong plants at 10s. 6d. each, with usual trade discount.

The great improvement of late in the colour of Fuchsias has added much to their value, but while that quality has been attained, others of equal or perhaps greater importance have not been so rapidly advancing, namely, form and habit, the latter in many instances being even worse in new than in old varieties; it will therefore be evident that improved form and habit are highly desirable. The above fine Fuchsia has these qualities in an eminent degree, and is therefore invaluable for the purpose of hybridisation alone; but apart from this it is considered of first-rate merit, as the following extracts will show:—

Mr. C. Turner, in a letter of August 27 says, "Your Fuchsia is a fine flower, of best form. I wish the corolla had been darker."

John Edwards, Esq., in National Garden Almanack.

"Stokes' 'Duke of Wellington' Fuchsia is reputed to possess many high class claims; this, we know, that the men of Birmingham are amply competent to appreciate all that pertains to merit in Fuchsias."

Mr. Glenny, in Lloyd's Newspaper of October 2, remarks:—

"We some time ago noticed an extraordinary Fuchsia, of which the blooms were sent by Mr. Stoke. We have now others from MOORE & SON just announced—'The Duke of Wellington.' We could wish for a more decided contrast, but there is everything else that can be desired; the form, size, habit, and its reflexing qualities especially, place it among the best." And again, October 9, 1853:—

"'Duke of Wellington,' the variety was raised by Stokes, who sent it long ago to us for our opinion, which was highly favourable; in fact, the flower loses upon only one point, which is the same as the Duchess of Lancaster does."

Mr. S. Moreton, of Birmingham, in a letter dated March 1853, says:

"The Fuchsia 'Duke of Wellington' I selected from a number of seedlings submitted to me last autumn by Mr. Stokes. It is a fine variety; the form is undeniable, and will please the most fastidious of the Birmingham growers. The tube is short; the sepals a light rosy scarlet, very broad, of good substance, and reflexing so as nearly to hide the tube; the corolla a rosy purple, proportionate, nicely rounded and smooth; size, a full average. The flower has only one fault, viz.:—corolla scarcely strong enough in colour, but from its excellent habit will make one of the best exhibition varieties that has been let out in this locality."

Mr. George Glenny, in his Garden Almanack:—

"The flower is an acquisition, and the drawing faithfully executed." In the sheet Almanack it is classed among Fuchsias "really fine;" and by letter dated February 8, Mr. G. remarks, "The Duke is different to anything else."

At Handsworth and Lozells Exhibition, July 26th, it was highly commended by the judges. See *Midland Counties Herald*, July 28, report of the Show.

At the Wolverhampton Horticultural Show, August 30, it was awarded a Certificate of Merit; also at Wellington, Salop, September 5, and at Walsall, September 14, the only places where it has been shown for a prize. It has already been seen and ordered by the following gentlemen:—

Messrs. A. Henderson & Co.	Mr. G. Smith
„ Jackson & Son	„ R. Smith, Worcester
„ Fisher, Holmes, & Co.	„ Rogers, Uttoxeter
„ J. & C. Lee	„ McPherson, Gardener to the Rt. Hon. Lord Calthorpe
„ A. Paul & Son	„ Poole, Gardener to the Rt. Hon. Earl Aylesford
„ MacIntyre&MacIntosh	„ Carpenter, Gardener to Sir F. Scott, Bart.,
„ Low & Co.	
„ E.G. Henderson & Son	
Mr. C. Turner	

And many others.

London Agents, Messrs. HURST & M'MULLEN, 6, Leadenhall Street.

A Coloured Lithograph, correctly and beautifully executed, may be had free by post for 24 stamps, which will be allowed to purchasers of not less than three plants.

WHEELER'S SHORT SELECT SEED LIST.

J. C. WHEELER AND SON'S SEED LIST *is now ready, and will be forwarded free on application. We have tried to make it as short and as select as possible, leaving out all inferior varieties, so that it is really a List of the best Seeds in cultivation. Grasses and other Agricultural Seeds, Garden and Flower Seeds, all described, and prices put to every article. We deliver our Seeds Carriage Free to almost every Railway Station in the kingdom, and take especial care that every sort we send out is true to name, and of the best quality.*

J. C. WHEELER & SON, Seed Merchants, Gloucester.

RENDLE'S NEW FARMING PRICE CURRENT AND AGRICULTURAL DIRECTORY FOR 1854.

OPINION OF THE EDITOR OF THE "MARK LANE EXPRESS:"—

"We have just seen a copy of this excellent Price Current, and consider it a most valuable companion to the Agriculturist. It is the same size as the garden edition, lately reviewed in this paper. It contains an excellent Almanack, with the University Terms, Eclipses, &c., and a List of Fairs and great Markets held in the four Western Counties. The descriptive lists of Grasses are excellent; they give all the best varieties for permanent pasture, ornamental parks and lawns, sheep walks, heathy and moory lands, &c. Then comes the list of Clover and Turnips, all described in a concise and useful manner. Then follows descriptions of the best Mangold Wurzel, Carrots, and other vegetables used in agriculture; then we have a Price Current of all the best Natural and Artificial Manures, with much useful information relative to Peruvian Guano, Lawes' Patent Superphosphate, Nitrate of Soda, Bone Dust, Bolivian Guano, &c.; then are found some very good advice relative to the purchase of so-called Wheat Manures; but the best Paper is one contributed by J. B. Lawes, Esq., of Rothamsted, 'On the Cultivation of one Green Crop after another on Heavy Land.' This should be read by all engaged in agricultural pursuits. There are some valuable tests for discovering adulterations in manures, by J. C. Nesbit, Esq., the celebrated agricultural chemist; and the report of a lecture by Professor Way on the same subject; then follow the Advertisements, comprising some illustrations of the best implements of the day. It is very well got up, and comprises 52 closely-printed pages, crown quarto size, and we strongly recommend it for the perusal of all engaged in the healthy pursuit of agriculture."

RENDLE'S PRICE CURRENT.—Opinion of the Editor of the *Illustrated London News*. See *Illustrated London News*, March 18, 1854.

"This is a scientific catalogue of the Seeds of Garden Plants by Mr. Rendle, of Plymouth, the eminent Nurseryman. The Pamphlet will be very suggestive to all who are fond of a garden, as it contains not only a classified list of every necessary or ornamental Garden Seed, but also the fullest description of the plants, and the mode of cultivating them. We rarely find so much information in so small a compass."

RENDLE'S PERMANENT PASTURE GRASSES *have always given the greatest satisfaction, and those who want Seed for the present season should consult* RENDLE'S "FARMING PRICE CURRENT AND AGRICULTURAL SEED DIRECTORY," to be obtained from

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

RENDLE'S PERMANENT PASTURE GRASSES *can be obtained from 24s. to 30s. per acre, according to sorts required. Renovating Grasses 10s. per acre, and all the best varieties known at the lowest market price. See Price Current.*

Apply to WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

NORTH DEVON EVERGREEN RYE GRASS.—*This Grass, which is held in great celebrity in the West of England, should be introduced into every mixture —for* PERMANENT PASTURE.

It is a very hardy Grass, and remains evergreen throughout the most severe winter. It forms a fine bottom, and is much liked by cattle. The true sort can be had from

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

Price from 5s. to 6s. per bushel, or 4d. per lb.

This Grass can be recommended with the greatest confidence.

RENDLE'S IMPROVED SWEDE TURNIP.—*The Stock of this excellent Swede has been grown for us this season by R. H. Watson, Esq., Dorsley, near Totnes. It is a most hardy and valuable variety. Price 1s. 6d. per lb. For further particulars and testimonials of its excellence see* "FARMING PRICE CURRENT," to be procured from

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

PERUVIAN GUANO, WARRANTED OF THE BEST DESCRIPTION, AND THE DIRECT IMPORTATION OF MESSRS. ANTONY GIBBS & SONS; LAWES'S *Patent Superphosphate, Nitrate of Soda, Bone Dust, and all other Natural and Artificial Manures, at the lowest remunerative prices.—See* RENDLE'S "FARMING PRICE CURRENT AND AGRICULTURAL DIRECTORY," to be obtained from

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

MORTON'S YELLOW GLOBE MANGOLD WURZEL, *saved by Thomas Bennett, Esq., Gloucester, from the Stock originally grown by J. C. Morton, Esq., the Editor of the Agricultural Gazette.*

Seed of this most excellent variety can now be obtained from WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth, who have purchased the whole of the Stock.

SEEDS TO IRELAND.—*Plymouth is admirably situated for supplying our sister country with some English Seeds. The Subscribers can refer to some of the leading families in Ireland, who have for many years obtained the whole of their supplies of Garden and Farm Seeds. Seeds delivered free to many of the Irish ports. See Price Current.*

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

WANTED, a quantity of Seedling COMMON HOLLIES and SILVER FIRS.—Apply to H. and R. STIRZAKER, Nurserymen, Skerton, Lancaster.

P. S. We have on hand about 20,000 fine transplanted Ash, from 4 to 5 feet, at 12s. 6d. per 1000; a reduction to the trade.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church Row, Stoke Newington, both in the County of Middlesex, Printers, at their Office, in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, MARCH 25, 1854.

HORTICULTURAL SOCIETY OF LONDON.—Notice is hereby given that the EXHIBITIONS OF FLOWERS AND FRUIT, in the SOCIETY'S GARDEN, in the present season, will take place on the following SATURDAYS, viz: May 13, June 10, and July 8; and that TUESDAY, April 25, is the last day on which the usual privileged Tickets are issued to Fellows of the Society.

GRAND NATIONAL TULIP EXHIBITION FOR 1854.—It will gratify all who are interested in this event, to learn that the Council of the Royal Botanic Society of London have given permission to hold the annual meeting of the GRAND NATIONAL TULIP EXHIBITION for 1854, at the Society's Gardens, in the Regent's Park, in connexion with the Royal Botanic Society's first show, on WEDNESDAY, May 24. Schedules and full particulars will be shortly announced. In the mean time communications are to be sent to CHARLES TURNER, Royal Nursery, Slough.

ROYAL OXFORDSHIRE HORTICULTURAL SOCIETY.—The SCHEDULE of PRIZES for the year 1854, is Now Ready, including those Open to all England, on the 27th of June, viz., Stove or Greenhouse Plants, 12: 1st Prize, 15*l.*; 2d, 7*l.* 10*s.* Geraniums: 1st Prize, 15*l.*; 2d, 3*l.*—Apply for same, and for further information, to Mr. W. R. HOBBS, Acting Secretary, 23, St. Giles's Street, Oxford.

NEW ROSES FOR 1854.

BENJAMIN R. CANT has now ready for sale, strong plants in pots of all the NEW ROSES, some of which have never before been offered to the public, descriptive Catalogues of which can be had on application.
St. John's Street Nursery, Colchester.

ROLLISSON'S UNIQUE.

JAMES JENNER, NURSERYMAN and GRAPE GROWER, Priory Nursery, Priory Grove, South Lambeth, begs to inform the Public he has a large and well grown stock of the above GERANIUM, which he offers from 8*s.* to 12*s.* per dozen. Also, large plants of Tom Thumb, for vases, &c., 9*s.* per dozen; small ditto, 4*s.* per dozen. Also, a large stock of all the best Bedding Plants, 4*s.* per dozen.

FUCHSIA—DUKE OF WELLINGTON.

J. MOORE AND SON, Perry Barr, Birmingham, beg to call attention to their advertisement of the 25th ult., and in answer to numerous correspondents, they beg to say that, although possessed of a Large and Fine Stock, they cannot in fairness send it out before the day appointed, namely, the 20th inst., when good Plants will be supplied at 10*s.* 6*d.* each, with Trade discount.

CHOICE ANTIRRHINUMS.

R. LAING is now sending out Antirrhinum Seed, saved from a fine Collection of Seedlings. If sown now in the open ground it will produce fine flowering plants in the autumn. An extra Prize was awarded for 18 of the varieties exhibited at the Isleworth Horticultural Show in June last. Packets 2*s.* 6*d.* each.—The Nursery, Twickenham, Middlesex.

NEW ANTIRRHINUMS.

JOHN DOBSON begs to offer the following splendid new varieties, which he feels assured will give the greatest satisfaction. They have been selected from several thousands of Seedlings. They have also been very favourably spoken of by Mr. Edwards in the National Almanac for 1854. Strong Plants in April, at 7*s.* 6*d.* each. Beatrice (Newton) very fine white, with stripes. Sulphurea (Dobson) the best yellow ever offered.
Woodlands Nursery, Isleworth.

FLORAL NURSERY, TURNHAM GREEN.

JNO. WESTWOOD has now the pleasure of announcing (in reply to very numerous applications) that his FIRST CATALOGUE will be ready in a few days, and will be forwarded to all who have already requested, as well as those who may apply for it. The List of GERANIUMS, FUCHSIAS, VERBENAS, CHRYSANTHEMUMS, &c., will contain nearly every variety grown, J. W.'s stock being the largest in the country. —The prices will bear favourable comparison with any others, being on the lowest scale possible.

PERMANENT PASTURE.

R. H. SMITHE, of Eastling, Faversham, Kent, is now prepared to send out his Mixtures of the NATURAL GRASSES, PERENNIAL CLOVERS, &c., to lay down Land to Permanent Pasture, at 25*s.* per acre, allowing 3 bushels to the acre, carriage free. Mixtures for Lawn, or any other purpose, or the sorts separate. Most of the species of Grass are collected by the Advertiser, and he will bestow the greatest attention in selecting such as shall constitute mixtures specifical to the soil, purpose, &c., of each buyer.

"NORFOLK HERO" CUCUMBER.—Without exception the very best Cucumber for open ground cultivation that has yet been offered. It is a most prolific bearer, as handsome as any frame variety, and is as delicate in point of texture, the fruit measuring from 16 to 20 inches in length. It is in the sole possession of YOUELL & Co., who will forward per post free (on receipt of postage stamps) packets containing six Seeds, 1*s.*; 18 Seeds, 2*s.* 6*d.* "To Market Gardeners the above will be found a great acquisition."—Royal Nursery, Great Yarmouth.

NEW PLANT CATALOGUE FOR SPRING 1854.

WILLIAM E. RENDLE & Co., Plymouth, *have now the pleasure of announcing that their new Spring Catalogue of Stove and Greenhouse Plants, Geraniums, Dahlias, Azaleas, Camellias, Fuchsias, Cinerarias, Chrysanthemums, and other Flowering Plants, is now ready, and can be had in exchange for One Penny Stamp.*
Apply to WILLIAM E. RENDLE & Co., Nurserymen and Seed Merchants, Plymouth.—Established 1786.

GRASS SEEDS FOR PERMANENT PASTURE.

WHEELER AND SON'S DESCRIPTIVE LIST of GRASS SEEDS will be forwarded free on application.
J. C. WHEELER AND SON, GLOUCESTER.

A. VAN GEERT, NURSERYMAN, Ghent, Belgium, begs to inform amateurs and the trade that he has just published a SUPPLEMENT to his CATALOGUE of PLANTS for the present year, which may be obtained on application to his Agent, Mr. R. SILBERRAD, 5, Harp Lane, Great Tower St., London.

A FIRST CLASS CATALOGUE OF GERANIUMS, VERBENAS, FUCHSIAS, DAHLIAS, HOLLYHOCKS, ETC.

GEO. SMITH begs to announce that the above is now ready and will be forwarded in exchange for one postage stamp.—Tollington Nursery, Hornsey Road, Islington.

FINE MANGOLD WURZEL SEED.

LONG RED MANGOLD WURZEL.—Fine new Seed, 10*d.* per lb., or 70*s.* per cwt.
JOHN SUTTON AND SONS, Seed Growers, Reading, having a large Stock of the above, are now selling it at the low price here quoted. LARGE YELLOW GLOBE and other sorts, as see Priced List, which may be had in return for two Postage Stamps.

HARDY FLOWER SEEDS POST FREE.

SUTTON'S CHOICE ASSORTMENTS:—

Do. do. new dark Pigmy.	Nemesia versicolor.
Do. do. new yellow Pigmy.	Cenia turbinata.
Do. do. double orange African.	Mignonette, new large variety.
Do. do. double lemon African.	

The above MARIGOLDS are well known in the locality, having obtained First Class Awards at several Provincial Exhibitions; all own saved from carefully selected double flowers, and can be recommended with confidence. In packets of about 1000 seeds each. The Marigolds separately, 3*s.*; the whole collection of 13 packets, 5*s.*
Collections of all the most approved Annuals (own growth) 60 packets, 10*s.*; 30 do. 5*s.*; 15 do. 2*s.* 6*d.*, in descriptive and cultural labels. Catalogues may be had on application.
JOHN SLATER, The Nurseries, Malton, Yorkshire.

BEAUTIFUL NEW BEDDING PLANT.
MILLER'S HYBRID MULE PINK.

ROBERT MILLER, Hartshill, Nursery, Newcastle, Staffordshire, offers with confidence the above Pink, colour a bright crimson scarlet, double; grows from 9 to 15 inches high, branches out and forms a little bush, and flowers most abundantly from June to October, and perfectly hardy. See *Gardeners' Chronicle*, Sept. 24, 1853.
DIANTHUS R. M., very pretty, and being dwarf in habit, it will doubtless make a good bedding plant. Price 12*s.* per doz., package included. The usual discount to the Trade. To be let out the second week in April. Post-office orders from unknown correspondents made payable at Newcastle.

UNBLOOMED SEEDLING CALCEOLARIAS.

C. KIMBERLEY has a large stock of the above; the seed was saved from that well-known favourite Kinghorn's Masterpiece, and other splendid kinds, carefully impregnated. The plants are nice and healthy, established in small pots, and may be had at 6*s.* per dozen, or three dozen for 15*s.*, Hamper included.
Nurseries; Pinley and Stoke, near Coventry.

HOLLYHOCKS.

A. PAUL AND SON have now ready for Sale a very large and healthy stock of HOLLYHOCKS, suited to bloom well next autumn; Border Flowers, 4*s.*, 6*s.*, and 9*s.* per dozen; fine named kinds, 12*s.*, 18*s.*, 24*s.*, and 30*s.* per dozen. A fresh supply of their new and unrivalled seedlings, which obtained first prizes at the leading exhibitions last year, and were never once beaten, will be sent out the end of the month, strong, healthy plants. A priced descriptive Catalogue free by post on application.
Recently published, free by post, price 1*s.*, AN HOUR WITH THE HOLLYHOCK.
N.B. Post-office orders may be drawn on Waltham Cross or London.—Nurseries, Cheshunt, Herts.

MAY'S PARAGON CABBAGE.

THE Subscriber, in offering the above for the first time, guarantees it to be the finest Cabbage in existence; of dwarf habit; has never been known to run; attains a large size (having been grown to the great weight of 28lbs.); of a most beautiful green, and boils tender as Asparagus, which it continues to do throughout the season; in flavour is as far superior to the ordinary Cabbages of the day as they are to the old Drumhead Scotch. In ½ oz. packets, 1*s.* each, free by post. The usual allowance to the trade.
H. M. begs to inform the public that he is unable to supply any more of his MAGNUM BONUM LETTUCE, as the stock was only small and is completely sold out.
Address all orders and communications to HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

CAPE HEATHS.

W. J. EPPS begs to call attention to his extensive and rare Collection of Heaths, which are in the finest condition possible; very bushy and well formed for specimens in 3, 4, and 6-inch pots, consisting of all the best varieties, such as Aristata ampullacea, tricolor, jasminiflora, ventricosa, Massoni, Webbiana, obbata, &c., &c., 12*s.*, 18*s.*, and 21*s.* per doz. A Collection of 100 varieties, 5*l.*, carriage paid to London. A liberal allowance to the Trade, provided a quantity be taken. All the new and best kinds of Azaleas, Stove and Greenhouse Plants, Fuchsias, Dahlias, Verbenas, and Roses, equally moderate.
W. J. E. has about 200 young specimens of Heath, &c., to part with in 8, 11, and 20-inch pots. Also a Collection of very beautiful Orchids. Lists sent on application.
Nurseries, Maidstone and Ashford.

DOUBLE FRENCH MARIGOLD AND CAPE STOCK SEEDS. A packet of beautiful DOUBLE FRENCH MARIGOLD SEEDS forwarded on receipt of Seven Penny Postage Stamps. Ditto, SCARLET CAPE STOCK; ditto.
EDWARD SANG & SONS, Nursery and Seedsmen, Kirkaldy, N.B.

N.B. Printed regulations for treatment sent; also, just arrived very moist and open Parmasan Cheeses.

NEW ALSIKE CLOVER, Price Ten Guineas per cwt., or in small quantities at 2*s.* per lb., may be had on application to Mr. H. RAYNBIRD, Basingstoke, Hants. Also New Home-grown ITALIAN RYE-GRASS, of good and genuine Stock, at 30*s.* to 35*s.* per quarter.

PAGE AND CO.'S

BLIGHT COMPOSITION should be in the hands of all Plant and Fruit Cultivators. 4*s.* per gallon, sufficient to make four. For testimonials see back leaf *Gardeners' Chronicle*, March 11, 1854.
GARDEN AND AGRICULTURAL SEEDS, first quality, and lowest market price.
Oxford Street (adjoining Radley's Hotel, 20 yards from the Railway and Docks), Southampton.

BALSAM SEED.—Mr. GLENNY has none but mixtures left, but they contain all the varieties; 60 seeds for 13 stamps.
DAHLIA SEED.—A few sealed packets of 100 seeds from 12 first-rate flowers, grown by themselves, 30 stamps. Mr. GLENNY engages to procure all the subjects recommended in his Almanac, if they are to be had at all; letters only attended to.—420, Strand.

SUPERB SHOW CARNATIONS, PICOTEES, PINKS, AND PANSIES.

JOHN HOLLAND, Bradshaw Gardens, Middleton, near Manchester, is now sending out choice selections of the above, in strong well-rooted plants, package, &c., included.

25 pairs of Show Carnations in 25 different varieties	£1	0	0
25 pairs of Picotees	do.	do.	1	0	0
25 pairs of Pinks	do.	do.	0	10	0
25 pairs of fine show Pansies, in 25 distinct varieties	0	12	0

Auriculas, Alpines, Polyanthuses, &c. Extra fine selected Pansy Seed, 1*s.* and 2*s.* per packet. A few packets of Auricula Seed, extra fine, 2*s.* 6*d.* per packet. Priced and Descriptive Catalogues are now ready, and may be had for one postage stamp. Post Office orders to be made payable at Middleton, Lancashire.
J. H. begs to refer to his Advertisement in this Paper of March 25th, for names of a portion of his stock of Pansies.

GEORGE BAKER begs to say that his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, CONIFERS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES, &c., may be had by enclosing two postage stamps.
G. B. wishes to call particular attention to his fine Stock of GREEN and WEEPING HOLLIES, from 1 to 12 feet high.
G. B. has supplied the American Exhibition in the Royal Botanic Gardens, Regent's Park, from its commencement.
American Nursery, Windlesham, near Bagshot, Surrey, about six miles from Staines Station, Windsor Branch, South-Western Railway, where conveyances may be obtained.

FIRST CLASS NEW VERBENAS.

GEORGE SMITH, in offering the following, warrants them to give entire satisfaction; having this season raised three times the usual number from seed, and with greater success than usual, has been able to select twelve distinct and beautiful varieties, which G. S. flatters himself cannot fail to please.

CALIBAN—Rosy purple crimson, extra large, smooth on the edge and of fine form, has taken First-class Certificates at the National, Brighton, and North London Floricultural Societies.

CLIMAX—Rosy purple, eye shaded with crimson maroon, extra large, of fine form and extra fine show flower.

ANGELINA—Rosy purple, primrose eye, very large, of fine shape. First-class at the Royal Surrey Gardens.

ELECTRA—Bright lilac, fine conspicuous eye, large, of exquisite form. First-class at the Royal South London and the North London Societies.

ISLINGTON RIVAL—Bright scarlet, eye white, flower large and smooth, a free bloomer. First-class Certificate at the National, Brighton, Royal South London and North London.

NOBLISSIMA—Rosy peach, with conspicuous white eye, truss large, of exquisite form. First-class at the Royal South London, also the North London.

FORGET-ME-NOT—Lavender, with large crimson purple eye, a most conspicuous variety, of fine form, extra large and a profuse bloomer. First-class at the Royal South London, Brighton, and the North London.

TRIUMPH—Scarlet crimson, eye white, surrounded with maroon, form exquisite. First-class at the Royal South London, National, and North London.

QUEEN—Pure white, the eye surrounded with bright cherry, pip extra large and smooth. First-class at the Royal South London and North London.

SCARLET KING—Deep scarlet with white eye, fine habit, a free bloomer, flowers large, extra fine bedder.

MAGNIFICENT—A brilliant puce, of fine form, truss large, very free, surpassing all of its class, either a show or bedding var.

ZARIA—Rich lilac, dark eye, large, of fine form, an extra fine variety.

The Set of 12 for 2*l.* 5*s.*, or 6 for 25*s.*, in strong plants, about the 20th of April.

FUCHSIA "TELEGRAPH."

This splendid variety will be found an acquisition. The Plant is of fine growth and habit; the contrast is greater than in any other dark Fuchsia; the tube and sepals are smooth, the latter thick and broad, of brilliant coral red, well reflexed; corolla deep violet, of good size, and circular; quite equal to and distinct from Glory and Nil Desperandum. Strong Plants about the 20th of April, at 10*s.* 6*d.*; with all the leading varieties of Florists' Flowers. Catalogues forwarded in exchange for one postage stamp.

Tollington Nursery, Hornsey Road, Islington, London.

BASS AND BROWN'S SEED AND PLANT LIST free by post for three penny stamps.

COLLECTIONS OF VEGETABLE SEEDS, comprising the best in cultivation, including several new sorts of first-rate quality, 3*l.*, 2*l.*, 25*s.*, and 15*s.*

For a few choice new Vegetables, see *Gardeners' Chronicle* of Feb. 13th and 27th, advertised.

FLOWER SEEDS—BEST ASSORTMENTS, free by post.

The Catalogue gives colours, heights, months of flowering, hardiness, duration, and much descriptive information of time of sowing, and other treatment.

	s.	*d.*
100 varieties select showy Annuals, including the newest	15	0
50 vars. do., 8*s.* 6*d.*; 30 vars., 5*s.* 6*d.*; 20 vars.	4	0
20 varieties best Dwarf Annuals, in large packets, for filling beds on lawns, 7*s.* 6*d.*; 12 do.	5	0

April 1, 1854.

J. COLE begs respectfully to inform the Floricultural Public that he has some very fine Shrubby Bedding CALCEOLARIAS to offer them, namely, PRINCE OF ORANGE and ERECTUM. The former a dark orange with a large umbel of flowers nearly as large as "Kentish Hero;" the latter an orange with a scarlet tinge, of erect habit, similar to "Viscosissima," with much larger flowers. J. C. flatters himself they will give the greatest satisfaction to all purchasers, being entirely shrubby and free from that coarseness of foliage many of the varieties evince. "Prince of Orange" is of dwarf habit, with small green glossy foliage, and never infested with green-fly, which is a great acquisition in the Calceolaria. J. C. offers them at 5*s.* per plant. The usual discount when three are taken. Flowers of them were submitted to some of the leading London nurserymen, who wished to have plants when sent out. A remittance solicited from unknown correspondents.

Keyfield Nursery, St. Albans, Herts.

YOUELL AND CO. beg to offer the following CONIFERS,

most of which, being in pots, may still be removed with perfect safety; indeed, owing to the backward spring, they have not yet commenced growth in our Nursery, so that the largest specimens would not injure by removal.

CEDRUS DEODARA AND ARAUCARIA IMBRICATA.—The beauty and unique character of the above hardy and most ornamental of all Evergreen Trees are too well known to admit of any comment. Our plants are grown within 500 yards of the wash of the Sea, in this the most eastern point of England, and consequently fully exposed to the gales of the North Sea and German Ocean, which they stand with impunity. The advantage to be derived from the selection of such for similar exposed situations must therefore be obvious, whilst their removal to a more genial climate is calculated to induce them to grow with extraordinary vigour; and these remarks hold good not only concerning the Araucaria imbricata and Cedrus Deodara, but also in regard to all the other Conifers enumerated below.

CEDRUS DEODARA.

" Globes, Tankards, &c.
" FARM SEEDS of all descriptions.

Priced Lists, Detail Catalogues, and other information can be obtained on application to THOMAS GIBBS & CO.

NEW DAHLIA, FUCHSIAS, AND PETUNIA.

CHARLES KIMBERLEY begs to offer the following novelties:— DAHLIA.

MAGNET (KIMBERLEY'S).—Ruby crimson, a distinct shade of colour, very constant, one of the best Dahlias of the season. Obtained a Certificate at Brighton Open Show, Sept. 14, 1853, and the National Floricultural Society, London, Sept. 22 (six blooms at each place, cut from two plants); also in the first stand of 24 blooms at Leamington, Aug. 30, 1853. Height 3 feet, plants the first week in May; 10*s.* 6*d.* each.

FUCHSIAS.

HENRY MONTEITH (KIMBERLEY'S).—Tube and sepals rich crimson, corolla deep purple; awarded the first prize at the Coventry Horticultural Society, Sept. 13, 1853, and acknowledged by all who saw it to be the finest specimen ever seen. Plants the first week in April; 7*s.* 6*d.* each.

GLOBOSA SPLENDENS (KIMBERLEY).—Tube and sepals rich crimson with deep purple corolla; the largest and best Globe Fuchsia ever raised. Plants the first week in April; 7*s.* 6*d.* each.

PETUNIA.

NOVELTY (KIMBERLEY'S).—Blotched lilac, a distinct and beautiful variety, awarded a Label of Commendation at the National Floricultural Society, Sept. 22, 1853. Plants the first week in April; 3*s.* 6*d.* each.

A Descriptive Catalogue of Dahlias, &c., may be had on application.—Pinley and Stoke Nurseries, near Coventry.

CHARLES TURNER will have ready to send out by the 1st of May, strong plants of the following:—

NEW DAHLIAS.

KING OF YELLOWS (COLLIER).—Pure yellow, petals smooth, and well rounded; very double, good outline, and very constant; the best of its class. This superb variety was awarded First-class Certificates at the National Floricultural Society; Royal South-London Society; Slough; Surrey Amateur Dahlia Society, and several other metropolitan exhibitions. 10*s.* 6*d.*

GOLDEN EAGLE (W. HOLMES).—Bright golden orange of the most pleasing shade, quite new, and distinct in colour to any variety at present in cultivation; very double, constant, and of good form. Certificate of merit at the National Floricultural, and several other societies. 10*s.* 6*d.*

TALISMAN (FELLOWES).—Rich deep-shaded plum, medium size, very deep and well formed, with prominent close high centre. This is a fine show flower. First-class Certificate at Norwich. 10*s.* 6*d.*

LADY MARY LABOUCHERE (TURNER).—White delicately tipped with lavender, resembling Lady St. Maur in colour, but of good form, high centre, and very useful show flower. It was awarded Certificates of Merit at the National Floricultural Society; Trowbridge, and Newbury. 10*s.* 6*d.*

ROSEA ELEGANS (RAWLINGS).—Lilac Rose, approaching the old Dahlia "Hope" in shade of colour. The petals are smooth and very stout; good exhibition flower, of medium size. 10*s.* 6*d.*

FANCY VARIETIES.

ADMIRATION (GREEN)—White, edged with scarlet; the white is pure, and the marking regular; fine form, and very constant: has been successfully shown at the principal exhibitions. It was awarded a First-class Certificate at the Royal South-London Floricultural Society; Certificate of Merit at the National and Slough Shows, 4 feet. 10*s.* 6*d.*

HENRIETTA (HOWARD)—Bluish-violet purple, tipped with white; chaste, novel, and fine form, with smooth stout petals; a first-class flower, 3 to 4 feet. 10*s.* 6*d.*

NEW FUCHSIAS.

The following eight new varieties were raised by E. Banks, Esq., the successful raiser of "Glory," and several other established favourites, and are highly recommended by C. Turner.

AUTOCRAT, a large bold dark variety, tube and sepals crimson, with rich smooth dark corolla; reflexes back to the tube. 7*s.* 6*d.*

CHARMER, white tube and sepals, purple corolla, free habit; very novel and attractive, being a light variety, with a decided purple corolla. 7*s.* 6*d.*

VANGUARD, rich crimson tube and sepals, with intensely dark corolla; shape and habit very good, extra fine. 7*s.* 6*d.*

QUEEN OF HANOVER, pure white tube and sepals, carmine corolla, stout, reflexes handsomely, good habit. 7*s.* 6*d.*

ELEGANS, a beautifully reflexed dark variety, of the richest colours. 7*s.* 6*d.*

OMEGA, crimson tube and sepals, bright lilac corolla, very dissimilar to all existing varieties, good shape. 7*s.* 6*d.*

CLIO, white with lake corolla; large, stout, and free-flowering one of the best light varieties. 7*s.* 6*d.*

MAGNIFICA, crimson, dark purple corolla; an excellent flower, of good form. 7*s.* 6*d.*

NEW VERBENAS.

MRS. D. TYSSON (ROBINSON), white, with large deep crimson eye; pips large, flat, and smooth; full size truss, and remarkably close dwarf habit; well adapted for bedding or pot culture; extra fine. 5*s.*

ANNIE LAURIE (EDMONDS), rosy-purple, with large white eye; large, very fine shape, and good grower; extra fine. 5*s.*

ROUGE ET NOIR (EDMONDS). rich dark crimson, distinct white eye, very novel, and attractive for bedding; fine. 5*s.*

PRESIDENT (EDMONDS), dark maroon, with large white eye; very conspicuous, novel, and showy; fine. 5*s.*

MRS. GERARD LEIGH (EDMONDS), lilac, with large white eye, fine shape, and free bloomer; extra fine. 5*s.*

BRIDESMAID (EDMONDS). white, large rose eye, full size, free flowering, and fine for bedding. 5*s.*

CANARY BIRD (EDMONDS), sulphur yellow, good shape. 3*s.* 6*d.*

C. T. begs to offer good plants of the newest and best varieties of POMPON CHRYSANTHEMUMS, at 9*s.*, 12*s.*, and 18*s.* per dozen. These can be supplied at once.

THE FLUKE KIDNEY POTATO.

CHARLES TURNER begs to call attention to this excellent Potato for a general crop. It is a most prolific variety, superior flavour, large size, smooth skin, and keeps remarkably free from disease. Price 12*s.* per bushel.—Royal Nursery, Slough, Bucks.

SUTTON'S PERMANENT GRASS SEEDS.

GENTLEMEN intending to lay down LAND to PERMANENT PASTURE, or for one or two years lay, are recommended to communicate with us, stating the nature of the soil and situation, that we may advise as to sorts of Grass Seeds most suitable. Having had many years' experience in laying down Land to Permanent Pasture in almost every part of the kingdom, we can confidently undertake to supply the sorts of Seeds best adapted to the land to be laid down. The following sorts of NATURAL and ARTIFICIAL GRASSES may be had separate, at low prices. All the best and most suitable of them are contained in Messrs. SUTTON'S MIXTURES.

Achillea millefolium	Agrostis alba	Festuca loliacea	Festuca tennifolia	Lolium Italicum	Poa fertilis
Agrostis stolonifera	Agrostis vulgaris	Festuca ovina	Glyceria aquatica	Lotus corniculatus	Poa sempervirens
Anthoxanthum odoratum	Bromus arvensis	Festuca rubra	Holcus avenaceus	Medicago Lupulina	Trifolium minus
Alopecurus pratensis	Cynosurus cristatus	Festuca pratensis	Lolium perenne sempervirens	Phleum pratense	Trifolium pratense perenne
Avena flavescens	Dactylis glomerata	Festuca elatior	Lolium perenne	Poa nemoralis	Trifolium repens
	Festuca duriuscula	Festuca heterophylla	Paceyanum	Poa pratensis	Trifolium hybridum
				Poa trivialis	

As some Agriculturists feel a pleasure in making their own selection of Grass Seeds, the above List is presented, but the greatest economy and certainty of success will be obtained by procuring Messrs. SUTTON'S *Mixtures, as see below:—*

SUTTON'S MIXTURES FOR LAYING DOWN LAND TO PERMANENT MEADOW OR PASTURE, 24*s.* to 30*s.* per acre, according to the sorts which the soil may require.

SUTTON'S MIXTURE FOR LAYING DOWN WATER MEADOWS.—In this department also we have been very successful. Cost of Seeds for this purpose, 24*s.* per acre.

MIXTURES TO LAY DOWN NEW PARK LAWNS.—For this purpose all coarse growing kinds are carefully excluded, and the sward will at all seasons present a luxuriant verdure, so desirable in parks contiguous to the mansion. The cost of Seeds for this purpose will vary according to the nature of the soil, and other circumstances. We quote the following from the *Reading Mercury* of July 9, in allusion to a new plot of building land, called "DOWNSHIRE SQUARE:"—"*The Grass Lawn especially is worthy of remark, it having been prepared and sown by* Messrs. SUTTON *only about four weeks since, and already presents a perfect close sward, much more green and beautiful than the natural meadow outside the railing.*"

SUTTON'S RENOVATING SEEDS FOR IMPROVING OLD PASTURES.—Many old Upland Pastures, Parks, and Meadows are nearly destitute of Clovers and the finer and more nutritious sorts of Grasses, in which case we are in the practice of furnishing only such sorts as are wanting. Quantity of Seed required, 8 to 12 lbs. per acre. Price 1*s.* per lb.

PERMANENT EVERGREEN GRASSES FOR CHURCHYARDS, &c.—We have had the honour of supplying many Clergymen and others with Grass Seeds for Churchyards and Cemeteries, which have given great satisfaction. Price of Seed, 1*s.* per lb. From many similar letters we extract the following:

From Mr. C. Judd, Gr. to his Grace the Archbishop of Canterbury.

"The Grass Seeds received from you succeeded admirably, and, although sown late, the growth was such that we were enabled to mow the Churchyard in the autumn, and it has now the appearance of an established lawn of some years' standing; and my employer, the Archbishop of Canterbury, is quite satisfied with its appearance."

"*Addington Park, January 7th*, 1853."

FINE LAWN GRASS SEEDS.—For Improving Old, or making New Lawns. Price 1*s.* 3*d.* per pound, or 3*s.* per gallon.

The following is an extract of a letter received from Dr. Lindley.

"MESSRS. SUTTON.—We have already made trial of your Lawn Grass Seeds, and it is but justice to say they have proved the best we have sown for many years.

(Signed) "JOHN LINDLEY.

"Horticultural Society, 21, Regent Street, London, Nov. 9, 1853."

GRASSES FOR ALTERNATE HUSBANDRY.—MIXTURES OF CLOVERS, RYE GRASS, FESCUES, &c.—For one, two, or three years' lay. These we can supply, of very best quality, at 14*s.*, 18*s.*, and 22*s.* per acre.

*** *Sacks and Bags are charged at cost price only, and the full amount allowed, if they are returned.*

JOHN SUTTON & SONS, SEED GROWERS, READING, BERKS.

PRICED LIST OF GRASS SEEDS OFFERED BY
J. C. WHEELER & SON, GLOUCESTER,
Seedsmen to the Gloucestershire Agricultural Society.

GRASS SEEDS.—CARRIAGE FREE.

WE have for some time paid considerable attention to GRASS SEEDS, and especially in mixing them in such proportions as the nature of the soil and other local circumstances may require, so as to form fine Pastures. Having had much experience in this branch of our business, and the Grass Lands we have laid down having given great satisfaction, it is with much pleasure that we can recommend a fine mixture of the best Grasses and Clovers, suitable for the formation of a rich Permanent Pasture, at from **20s. to 30s.** per acre. For improving the quality of Grasses already laid down, we can supply a good mixture at 1*s.* per lb. For the information of those gentlemen who would prefer buying the varieties separately, and mixing them themselves, we have given a short description of some of the best sorts. From 2 to 3 bushels of Grass Seed, and 12 lbs. of Clover is the quantity usually sown to the acre.

ITALIAN RYE-GRASS—Imported Seed ... per bushel 7*s.* 0*d.*

Too much cannot be said in favour of this very excellent Rye-grass. Compared with any other of the varieties of common Rye-grass, the Italian affords a stronger braird, arrives sooner at maturity, has a greater abundance of foliage and of a lighter and more lively green colour, grows considerably taller, and is more upright, or less inclined to spread on the ground. Another of its distinguishing characteristics is, that it is much preferred by cattle to any of the common sorts, and is greedily eaten by them, whether green or dry. Imported seed is very much superior to that saved in this country.

PERENNIAL RYE-GRASS ... ... per bushel 6*s.* 0*d.*

MEADOW CATSTAIL, OR TIMOTHY GRASS (Phleum pratense) ... ... per lb. 0 10

The Timothy Grass possesses the advantage of affording double the quantity of nutriment when its seeds are ripe, that it does if cut when in flower. On strong, tenacious, and rather moist soils, it is entitled to a precedence to almost any other, and should at least form a considerable portion of the mixture employed for sowing down such, either for alternate husbandry or permanent pasture.

MEADOW FOXTAIL GRASS—(Alopecurus pratensis) ... ... per lb. 1*s.* 6*d.*

This is one of the earliest and best of Pasture Grasses, but not so well adapted for hay, as it produces but few stalks; its root leaves are very broad, long, soft, slender, and grow rapidly when cut, or when eaten down by live stock. It requires two or three years after sowing to arrive at full maturity.

ROUGH COCKSFOOT—(Dactylis glomerata) ... per lb. 1*s.* 0*d.*

Is a valuable Grass in cultivation, on account of the great quantity of produce which it yields, and the rapidity with which its leaves grow after being cut. It is well adapted for growing in shady moist places under trees, as in orchards, &c.

MEADOW FESCUE GRASS—(Festuca pratensis) per lb. 1*s.* 0*d.*

This is an excellent Grass, either for alternate husbandry or permanent pasture, but more particularly the latter. It is well liked by all kinds of herbivorous animals.

HARD FESCUE GRASS—(Festuca duriuscula) per lb. 1*s.* 0*d.*

Will thrive on a great variety of soils, and is found to resist the effect of severe drought in summer, and to retain its verdure during winter, in a remarkable degree. From the fineness of its foliage and greenness in winter, it is well adapted for sowing in Parks, especially for sheep pasture.

SHEEP FESCUE—(Festuca ovina) ... ... per lb. 1*s.* 0*d.*

This Grass forms the greater part of the sheep pasture of the Highlands. In quantity of Grass it is much inferior to the other cultivated Fescues; but, from being well liked by sheep, it should always enter into the composition of mixtures of lands on which they are to be pastured; in fact, on the authority of Linnæus, these animals have no relish for hills and heaths which are destitute of this Grass.

WOOD MEADOW GRASS—(Poa nemoralis) ... per lb. 1*s.* 3*d.*

Its habit of growth is delicate, upright, close, and regular. There is no Grass better adapted for pleasure grounds, particularly under trees, as it will not only grow in such places, but forms a fine sward where few of the other fine Grasses can exist. It produces a considerable deal of foliage early in spring.

ROUGH-STALKED MEADOW GRASS—(Poa trivialis) ... ... per lb. 1*s.* 0*d.*

This is a valuable Grass as a mixture for Grass Lands, particularly on damp soils. Its habit of growth fits it for mixing along with the upright grown sorts, such as the Italian Rye-grass.

SMOOTH-STALKED MEADOW GRASS—(Poa pratensis) ... ... per lb. 1*s.* 0*d.*

This Grass yields a large quantity of herbage at a very early period of the season.

SWEET-SCENTED VERNAL GRASS—(Anthoxanthum odoratum) ... ... per lb. 2*s.* 0*d.*

This Grass yields but a scanty portion of herbage, yet, on the whole, Permanent Pasture should not be without a mixture of it, particularly in parks and pleasure grounds, were it for no other reason than its pleasant scent, not only when cut for hay, but also when the seeds become nearly ripe.

CRESTED DOGSTAIL GRASS—(Cynosurus cristatus) ... ... per lb. 1*s.* 6*d.*

From this Grass forming a close turf, and having rather fine foliage, it may be advantageously sown on lawns and other places to be kept under by the scythe.

LAWN GRASS SEED ... ... per lb. 1*s.* 6*d.*

By sowing this Grass a fine sward may be obtained in a short time, at one quarter the expense of laying down turf. It is a selection of the FINEST *Grasses, and is entirely free from weeds. We can strongly recommend it to those about to form lawns or pleasure grounds.*

CLOVER—White Dutch ... ... per lb. 10*d.* to 1*s.* 0*d.*
" Red or Broad ... ... " 9*d.* to 0*s.* 10*d.*
" Trefoil ... ... " 5*d.* to 0*s.* 6*d.*
" Cow Grass, or Perennial Red Clover per lb. 1*s.* 0*d.*

A vast quantity of Clover Seed is grown in Gloucestershire, more particularly the Perennial Red Clover or Cow Grass. When the selection of the varieties of Grasses and Clovers is left to us, we invariably send a good proportion of this; for Permanent Pasture it is invaluable. It will at all times afford us very great pleasure to give any information in our power on the subject of laying down land for Pasture; the proportions of the different varieties of seed should vary according to the nature of the soil and other local circumstances, and whether the land is intended to be laid down permanently or for a year or two. Any inquiries sent to us shall have an immediate reply, and one to the best of our judgment.

J. C. WHEELER & SON, SEED MERCHANTS, GLOUCESTER.

DAHLIAS FOR 1854.

CLARKE AND CO., SEEDSMAN, 86, Borough, London, beg to inform the public that they have published their New CATALOGUE of DAHLIAS, which they will be happy to forward on application. The following choice kinds are in the 10*s.* per dozen list this season, viz.:—Exquisite, Lilac King, Duchess of Kent, Amazon, Robert Bruce, Plantagenet, Bishop of Hereford; and amongst the 4*s.* per dozen varieties are Annie Salter, Rose of England, Louisa Glenny, Malvina, Triumphant, and a great many other good known flowers.

PINUS SABINIANA,

THE GREAT HOOKED CONE PINE OF CALIFORNIA.

PETER LAWSON AND SON, Edinburgh, have just received from San Francisco a small consignment of Seeds of this fine Hardy Pine. Price 2*l.* 2*s.* for 100 selected Seeds, free by post. They were gathered last autumn, and are in excellent condition and well grown—the seeds measuring about 1 inch in length. Being perfectly hardy, they may be sown in a dry sheltered situation in the open air.—Edinburgh, April 1.

"WELLINGTONIA GIGANTEA."

MESSRS. VEITCH, of EXETER and CHELSEA, have much pleasure in stating that their Seeds of the above magnificent Tree are vegetating satisfactorily. They therefore hope to be able to send out well established seedling plants during the ensuing summer and autumn. They are now taking orders for them at the following prices:—

For a Single Plant ...	2 guineas	For 8 Plants ...	10 guineas
For 4 Plants ...	6 guineas	For 12 Plants ...	12 guineas

And all orders will be executed strictly in the rotation in which they are received.—April 1.

WELLINGTONIA GIGANTEA.—Beautiful Lithographed Plates (from a drawing taken in California) of this wonderful Tree may be had, at 7*s.* 6*d.* each, of Messrs. VEITCH & SON, Exeter, and Mr. JAMES VEITCH, jun., Exotic Nursery, Chelsea.

The Bark, Wood, Cones and Foliage, which were exhibited on Tuesday week at 21, Regent Street, may be seen at the Exotic Nursery, Chelsea.—April 1.

The Gardeners' Chronicle.

SATURDAY, APRIL 1, 1854.

MEETINGS FOR THE ENSUING WEEK.

MONDAY,	April 3	Entomological	8 P.M.
TUESDAY,	— 4	Horticultural	3 P.M.
		Linnean	8 P.M.
FRIDAY,	— 7	Botanical	8 P.M.
SATURDAY,	— 8	Royal Botanic	3 P.M.

A LETTER has just appeared on the subject of the WOODS and FORESTS, which requires more than a cursory notice, especially since it opens a somewhat new view into the causes which have led to what the writer calls the ruin of the Royal Forests. Mr. BILLINGTON, the author of the pamphlet in question*, was formerly employed as Superintendent of the Forest of Dean, whence he was removed in the same capacity to Chopwell woods, where he remained for several years. About 1826 he was superannuated, entirely against his will, as he informs us, and has ever since been in receipt of a pension. The cause of his superannuation is not clear; we believe it to have arisen from his determination to do what he knew to be his duty, and his dogged resolution not to lend himself to a system of "making things pleasant." His own statement is that his superannuation allowance or pension was granted to him "under peculiar and discreditable circumstances." Be that as it may, there is no doubt that he contrived to give mortal offence to the gentlemen at that time charged with the administration of the Woods and Forests.

We do not venture to examine all Mr. BILLINGTON'S charges against the Commissioners of his day, but we must not entirely disregard them, because, although the events to which they relate have long since passed by, and many of the alleged actors in them are dead, nevertheless the statement before us may serve as a warning to Parliament, and we trust will prevent the possibility of a recurrence of such discreditable transactions as constitute the private history of the Woods and Forests.

The more material of Mr. BILLINGTON'S allegations are these. He says that he was removed from Dean Forest for no other reason than that he had offended Mr. MACHEN, the then deputy-surveyor, and the neighbouring gentry, by reports upon extensive damage done by deer, game, and sportsmen, which reports led the then Chief Commissioner, Lord GLENBERVIE, to command the destruction of the game. So grave an offence was never forgiven. If this were so, then it is clear that the deputy-surveyor and his friends thought the Forest of Dean was intended as a game preserve for their special enjoyment.

Having got into hot water on account of his anti-game reports, Mr. BILLINGTON tells us that he was removed to Chopwell. But here his rugged honesty soon brought about his final superannuation. He began by offering to prove that a friend of the Board had sacked 900*l.* by some private arrangement with the nurseryman who had the contract for planting the estate. He then informed the Board that thriving Oak plantations, of 50 years' growth, were cut down for the mere purpose of enabling the gentlemen concerned to carry out their private and beneficial arrangements; and he asserts that so gross was this case of—what shall we call it? ignorance? fraud?—that 10 years afterwards the Larch, planted under the beneficial contract aforesaid, were so overpowered by coppice from Oak stools, that scarcely a plant could be found big enough for a besom-handle. Notwithstanding these incidents it would seem that the Board was "perfectly satisfied with Mr.——'s conduct in every respect." Among other events that drew forth indignant remonstrance from the *protégés* of the Board, Mr. BILLINGTON mentions one of some significance. It seems that he had endeavoured to sell a quantity of Larch thinnings; but those around him insisted upon such stuff being his and their perquisite. Our obstinate friend would not agree in that view of the matter, and found a market for the thinnings in question, the proceeds of which he

* How the Royal Forests have been ruined: a Letter to ALEXANDER MILNE, Esq., late Commissioner of her Majesty's Woods and Forests, &c. By WM. BILLINGTON. LONGMANS and RIDGWAY. A Pamphlet.

carried to his public account. No wonder that he was immediately set down "as an unaccommodating stupid fellow, who could not see his own interest."

We are next informed that in order to put a bit in the mouth of William Billington, the Mr. Turner, of New Forest celebrity, who had been a journeyman carpenter under Mr. Nash, the architect, was despatched to Chopwell; and it would seem that upon his intelligent report our W. B. was superannuated; it having been found impracticable to convince him of the necessity of all the forest authorities "learning to pull one way." If, indeed, we are to believe that his memory has not failed him, we are to understand that the Board did not want any profit from the Royal forests. At all events, they took care that none should be realised, for in superannuating Billington, they appointed a Mr. James, "a military man—totally ignorant of everything relating to forestry." This gentleman was ascertained by Lord Duncan's committee to have been a lieutenant in a militia regiment. The doings of the new deputy-surveyor are recorded in our columns of July 2, 1853, and very extraordinary doings they were.

And thus William Billington's connection with the Royal Woods and Forests terminated.

Such was the reward of honesty in a public servant. That he was of a stern unbending nature is like enough; that he would have nothing to do with peculation seems clear; but that he was a good honest man, well acquainted with forest management, we have every reason to believe. No one could be spoken of more highly to ourselves than he was by a very successful planter in Flintshire, who looked with indignation upon the doings in Delamere. No wonder Billington was never mentioned to Lord Duncan's committee; his name would have thrown some gentlemen in Whitehall into a panic.

The *science* of diet seems still to be a desideratum, though chemical and medical investigations have contributed much towards the placing it on a sound basis. Articles like those of Dr. M'Cormack, page 101, seem likely to elicit principles; the Dr. says, "Food for working men must be substantial, varied, sufficient, savoury," to which may be added, of competent bulk, and furnishing all the elements of which the human frame is made up. Let food be deficient in any of these items, disease or premature old age is a never-failing consequence. It would seem that no class of persons is so competent as the physician to elicit the true principles on which the poor man's dietary should be founded, reference at the same time being had to his means, the climate in which he lives, to different seasons of the year, and the degree of labour he has to perform.

Climate has a powerful influence on the process of digestion; we have authentic records that an Esquimaux can eat and digest 8 or 10 lbs. of raw salmon, and that in the same arctic regions the British sailor can with impunity swallow half that weight of salmon, together with other food; whilst in more genial climates, the healthiest food consists mainly of vegetable matters, whether grain, pulse, fruits, or herbaceous plants. Considerations of this nature render it difficult to define the kinds of food most suitable for the British cottager or working man, though an approximation may be arrived at of that best, taking at the same time into consideration many other influencing circumstances.

The article, page 101, says that "food for working men must be *substantial*." It was on this account that several *substantial* articles have been suggested in the pages of the *Chronicle*. Gelatine, black puddings, chitterlings, lights, are all of them substantial; all of them are such as the gentleman can feed on with pleasure if well cooked; they have been eaten of at a gentleman's table in the ordinary course of providing for it; but it was under a persuasion that cheapness does not imply inferiority, though the commonalty seem under a conviction that what is dearest must be best. If *substantial* food be necessary for the working man, would it not be philanthropic to introduce many an article of diet that is now despised? To continue, food for the working man must be "*varied*." The food of the English cottager is anything but varied. Their wives are wholly ignorant of the many ways in which a bit of beef or mutton is habitually prepared in France, for example, to afford variety, not to speak of eggs, or of the combination of meat or fish with grain, pulse, or fresh vegetables. Further, food must be "sufficient." True, it must be sufficient in bulk no less than in nutritious quality; indeed this is intimated in the same article, which says that "the richest animal soups, even, will not keep men alive unless eaten with good bread." Food must also be "sufficiently savoury." It is in this particular, alas, that cottage cookery is altogether wanting, though in ancient times books indicate that many things were used to give flavour that are now neglected—Marigold flowers for instance. It is for want of savouriness that soups and stews have acquired the derogatory name of *messes*. It was to give savour that Count Romford added salt herring to his cheap dishes; it is in this respect that French cookery for all ranks surpasses that of England; and until our housewives become instructed in the means of obtaining savouriness, economical cottage cookery is not to be hoped for.

But how is this desirable quality attained in France? It is by the habitual employment of matters that give flavour; in the poor man's cottage those of little cost. A gentleman's cook would be thought shabby if asking at market for less than a sous' worth of "*herbes pour le pot au feu*," but the poorer orders are habitually served with a farthing's worth of vegetables for their soups; for their farthing they obtain a very small Carrot, a small Turnip, Onion or Leek, either full-grown or green, including green leaves, a sprig of Thyme, a little Mint, Parsley, or in lieu of it green tops of Celery, and to complete the vegetable ingredients of the soup either some Lettuce or Endive, often the surplus of a seed-bed, or plants not promising to come to perfection as salads. What would our cottagers say on being supplied with green leaves of Celery? yet in France they are often substituted for Parsley. So many articles that we throw away are used for giving flavour in France; as the rinds of Oranges, for instance. Our Carrots and Turnips are too large to be only part of a farthing's-worth; but why should not these roots be cut up for sale at petty standings? The cottager has in respect to vegetables a great advantage over the townsman, for in the country an allotment will furnish a variety of vegetables by cultivating it only at odd times; even the yard of small cottages may be made to grow Parsley, Thyme, and other sweet herbs; but a first need is that of teaching their wives how to make good use of the products of their garden by a superior mode of cookery.

VEGETABLE PATHOLOGY.—No. XIII.

52. Roots for the most part penetrate to a greater or less depth into the soil, according to their peculiar exigencies, sometimes running close to the surface, while in other cases, especially in the larger trees, they descend many feet into the earth, so as almost to verify the description of the Roman poet, who speaks of them as extending as far towards Tartarus as the trunk and branches into the air above.* The proportion borne by the roots to the stem with its branches and leaves is very variable according to the degree of evaporation which takes place. In aerial Orchids and Cacti the difference attains its maximum, and in succulent plants the roots are for the most part slightly developed, while in forest trees which present a vast expansion of foliage to the action of the air, the points of absorption must be multiplied in proportion. Roots are active, and consequently in a growing state at all seasons of the year, except during severe frost, and it is on this account that such advantages are obtained by autumnal in preference to vernal planting. Their object in every case is to imbibe water and the matters held in solution by it: earth is therefore only so far a necessary medium as it contains the matters requisite for the proper nutriment of the plant, may give out that nutriment in the true proportions, neither with too great speed, nor in too great quantities, and moreover as itself imbibing so much fluid as under ordinary circumstances not to admit of too large a measure of liquid being at once in contact with the spongelets—all very necessary conditions, except in individual cases, which, in addition to others, will be detailed more properly when we come to the consideration of the article Soil. It is clear, therefore, that the immediate presence of soil in contact with the roots is no necessary requisite of vegetation, as indeed appears from the multitude of air plants, the various aquatic species which float freely in the water†, and a variety of plants which occasionally derive a large portion of their nutriment immediately from water, or which, though usually growing in soil, are capable of sustaining life by means of water only.

53. Plants, according to their peculiar constitutions, are impatient both of excessive drought and moisture; it is not, however, in general the presence of abundant water which is injurious to plants, provided that water be constantly renewed; but water which remains long in contact with the soil becoming impregnated with putrescent matter or noxious gases, a material consideration in the theory of draining, though the concomitant depression of temperature forms undoubtedly a very material point in the question. Aerial roots have been already considered under a previous number.

54. Besides the purposes of nutrition, roots subserve a very important end in the economy of plants, namely, sustaining them in a fixed locality, by means of their numerous ramifications, and the consequent resistance which they offer to the violence of winds. Without a very high degree of development in the larger plants, it is obvious that the trees themselves would be a prey to every blast. Another important end which they answer is to keep up the due equilibrium of temperature by means of their imbibition of moisture from considerable depths where the earth maintains a temperature according to circumstances, either above or below that of the atmosphere. Such considerations, however, belong to a future division of our subject.

55. As the majority of plants are confined to a fixed spot, and peculiar constituents in the soil are absolutely requisite for the health of particular species, it is obvious that the exigencies of perennial plants could not in general be supplied, provided the spongelets remained stationary. Hence the necessity not only of repeated ramification, but of the progression of the tips of the roots in order to their contact with new portions of soil. It is this necessity which makes the change of place necessary in many perennial plants, a change which is peculiarly remarkable in plants propagated by bulbs and tubers, especially in terrestrial Orchids. The law of such progression is sometimes singular. Many examples will be found in the admirable essay of Irmisch on "Bulbs and Tubers," copious abstracts of which have been given by the author of the present notes in the "Journal of the Horticultural Society of London" for 1853. *M. J. B.*

* Virg. Georg., ii., v. 291.

† The roots of Lemna and Pistia are remarkable for the little cap with which they are terminated. This, as remarked by Schleiden, is no portion of cuticle carried forward by the projecting root, but an especial organ; it is already formed before the root bursts forth, and is apparently merely an exaggerated state of the pileorhize (Schleid. Grundz., vol. ii., p. 120; figs. 136, 137.) The slimy coat which is formed at the end of Hyacinth roots, when grown in water, is no true analogue, if considered abstractedly from the spongelet, and is due probably to mucilaginous excrementitious matter given out by the spongelet. Ingenious theories have been proposed for either case by botanists, who find it more easy to theorise than to observe. The very first root which is sent out by a germinating Lemna, like the rest, is furnished with the little sheath.

POINSETTIA PULCHERRIMA.

Few plants are more really useful than this, both for decorative purposes and for furnishing cut flowers; but unfortunately it is of a very straggling habit, and is not easily induced to form anything like a handsome well furnished specimen. Pieces of the ripened wood root readily if planted in light sandy soil, and afforded a gentle bottom-heat; or propagation may be effected by means of eyes treated in the same manner as those of Vines. Young shoots coated where cut with collodion would doubtless also root freely. In this case, by planting a sufficient number in a good sized pot, there will be no difficulty in obtaining compact bushy plants. The cuttings for this experiment should not be taken off until they are strong and rather firm, and of course stopping must not be resorted to, for that operation practised late in the season causes the plants to produce their brilliant floral leaves both scantily and small.

Cuttings rooted at the present time should be potted singly in small pots, and placed in a close warm pit, affording them a gentle bottom-heat till well established in their pots. When this is the case, shift into pots two sizes larger, using a rich light compost, say one-half prime turfy loam, one-fourth leaf-soil, and one-fourth of old thoroughly decayed cow-dung, well intermixed with plenty of clean sharp sand and lumpy bits of charcoal, to secure perfect drainage. If convenient to afford the plants bottom-heat till established, after this shift, it will be beneficial to them. But they must now be kept near the glass, and exposed to all the light possible, in order to induce them to make strong short-jointed wood. And when they are well established they should not be kept too close, as a moderate supply of air is necessary to secure strong wood. As to stopping, this must be regulated by circumstances, for it is useless to stop unless the eyes are somewhat prominent, as in this case only the uppermost would start into growth. The shoot should be bent so as to check the flow of the sap, and induce the lower buds to push slightly before stopping; but it must also be borne in mind that there is no chance of obtaining a fine display of scarlet bracts, except on strong well matured wood; and stopping must not be practised later in the season than will allow of securing this. Keeping the plants rather dry at the root, when a fair amount of growth has been obtained, and placing them in a rather dry atmosphere, will be useful in checking growth and producing a tendency to flower. When in bloom the plants may be placed in a close part of the conservatory, taking care to guard them from damp and currents of cold air.

After blooming they should be kept rather dry at the root, placing them in any out of the way part of a house, where the temperature may average from 45° to 50°; and when the leaves fall off, cut the shoots back to two or three eyes each. As early in spring as circumstances will admit of affording the plants a gentle bottom heat, with a moist growing temperature, shake the old soil from their roots, and repot in pots just sufficiently large to admit the roots, and water very carefully until they start into growth. By treating the plants as directed above, and keeping them near the glass, and the branches tied out, &c., to induce strong growth, good sized specimens will be obtained the second season. Manure water may be given with advantage in a clear rather weak state, to plants filling their pots with roots. *Alpha.*

PÆONIES.

For splendour of blossoms, brilliancy of colour, hardihood, and magnificent effect, these are unequalled by any other tribe of plants, and when successfully grouped their value for ornamental purposes is very great—blooming, as they do, throughout the spring and early summer months. The comparative rarity of the fragrant rose-

coloured summer-flowering variety in gardens generally, offers an opportunity for making a few remarks on kinds more commonly cultivated. The names of the respective varieties noticed are given as they generally stand in trade lists, so as to admit of their being obtained by the characters here given them. The following popular division of the genus into three progressive sections or groups, each in rotation to its period of blooming, &c., may possibly be as good a way as any of conveying correct information on the subject.

First Group, in bloom from the second week in April until May :—

1. Pæonia paradoxa simplicifolia	6. Pæonia arietina Grevillei
2. „ arietina oxoniensis	7. „ paradoxa fimbriata
3. „ „ peregrina compacta	8. „ mollis
4. „ „ decora	9. „ tenuifolia
5. „ „ Andersoni	10. „ „ flore pleno
	11. „ hybrida
	12. „ Moutan (arborea).

These are distinguished from the other sections by their less robust and generally more erect compact habit of growth, averaging from 1½ to 2 feet in height.

P. ar. oxoniensis is remarkable for its showy rich violet-crimson blossoms, measuring from 6 to 8 inches in diameter, and having clusters of clear yellow stamens in the disc or centre of each bloom.

P. arietina peregrina compacta is recognised by its peculiarly neat erect habit, being about 2 feet in height, with darkish green leaves, and numerous distinct rich purple cup-shaped blossoms, expanding to a roseate tint.

P. arietina decora grows from 1½ to 2 feet in height, with comparatively large single crimson purple flowers from 6 to 9 inches in diameter.

P. arietina paradoxa fimbriata has a very neat erect compact growth, with rich double purple blossoms from 6 to 8 inches in width.

P. hybrida.—This is an elegant variety, of medium height, and having neat Fennel-like scented leaves, and nodding terminal richly crimsoned single-petalled flowers.

P. tenuifolia flore pleno is a fine variety (18 inches to 2 feet), having beautifully divided narrow-lobed leaves, and double dark crimson blossoms, nearly 6 inches in diameter.

Second Section.—In bloom from the first week in May until June :—

13. Pæonia officinalis Byzantina (atrorubens)	16. Pæonia officinalis anemonæflora
14. P. officinalis rubro pleno	17. „ „ lobata
15. „ „ carnescens	18. „ „ albicans

This group includes a class of highly picturesque kinds, forming large robust hardy perennials, from 2 to 3 feet in height, with simple broad-lobed leaves, and gorgeous flower heads, from 6 to 9 inches in width, and varying from the deepest crimson to brightly shaded carmine and pale flesh colour. They are admirably adapted for adorning the foreground of select shrubberies and arboretums, in which positions they are unequalled for massive beauty and grandeur of effect. Those most deserving of notice are—

P. officinalis rubro pleno.—A well-known kind, with remarkably large rich crimson blossoms, measuring from 6 to 9 inches across.

P. officinalis Byzantina (atrorubens).—This is equally large as the last described, and readily recognised by its dark-tinted stems and foliage, and by the still richer and deeper crimson of its magnificent blossoms.

P. officinalis carnescens is perhaps the finest of the rosy carmine coloured sorts, its large and conspicuous blooms rendering it a noble and distinct variety.

P. officinalis anemonæflora.—This is a highly ornamental hybrid, 2 feet in height, with large single-petalled terminal, rich violet-crimson blossoms, measuring from 6 to 8 inches in width, and beautifully contrasted with yellow staminiferous sepals in the disc.

P. officinalis lobata is neat and compact in habit, growing from 18 inches to 2 feet in height, with ample broad-lobed leaves, and comparatively large and beautifully bright rosy salmon coloured blossoms, measuring from 4 to 6 inches in diameter.

Third Section, in bloom from first week in June until July :—

19. Pæonia albiflora uniflora	24. Pæonia albiflora pleno
20. P. albiflora sibirica	25. „ „ fragrans
21. „ „ vestalis	26. „ „ Humei
22. „ „ Whitleji (albiflora pleno syn.)	27. „ „ Pottsi
23. „ „ chinensis (albiflora pleno syn.)	28. „ „ festiva

This group is distinct in habit and colour, ranging from 2 to 3 feet in height, more erect and stately in growth, darker green in foliage, and terminating in blossoms varying from clear white to roseate purple and rich crimson. The varieties are well adapted for the summer decoration of select flower-gardens, and for the middle foreground of arboretums and shrubberies. Nos. 19, 20, 21, are neat habited plants, growing from 18 inches to 2 feet in height, with conspicuous single petalled white blossoms, from 6 to 8 inches across, and prettily contrasted with masses of yellow stamens in the disc. Nos. 22, 23, 24 are more stately in growth, and of similar habit, producing large conspicuous double white delicately-scented blossoms 6 inches in diameter.

P. albiflora fragrans is an exceedingly desirable kind, growing from 2 to 3 feet in height, with dark green leaves, and having large roseate-purple flowers, which diffuse a delightful rose-like odour.

P. albiflora Humei resembles the last in habit of growth, but occasionally it forms a larger plant with rougher surfaced leaves, and it has scentless rose-coloured flowers; but their want of fragrance is, in some measure, compensated for by their larger dimensions, averaging as they do on strong specimens from 6 to 8 or 9 inches in diameter.

P. albiflora Pottsi has very beautiful rich deep crimson-coloured double blossoms, and a medium-sized neat growth.

P. albiflora festiva is neat and dwarf in habit, with ample dark green leaves, and remarkably large, clear, creamy-white flower-heads, measuring from 6 to 9 ins. in diameter, and casually streaked and dashed with rosy crimson. *William Wood, Holdgate Nurseries, York.*

MR. M'GLASHEN'S TRANSPLANTING MACHINE.

The following is the report of the Caledonian Horticultural Society's Committee, appointed to examine the roots of trees and shrubs transplanted by means of this machine. The committee consisted of the following gentlemen, viz., Hon. Lord Murray, Sir J. Russel, Mr. Hunt, Mr. Girdwood, Mr. Sivewright, Mr. G. Patton, Mr. I. Anderson, Mr. W. T. Thomson, Mr. H. Graham, Mr. J. Wilson, Mr. M'Intosh, Dalkeith Park, Mr. M'Nab, Mr. D. Mackinlay, of Newlandburn, Dr. Graham Weir, Mr. Crawford, of Caitsburn, Mr. C. H. I. Smith, and Mr. Baxter Riccarton; with Dr. Balfour, Secretary, and Mr. Evans, Superintendent.

Edinburgh, March 4, 1854.

The committee beg to report that they were conducted by Mr. M'Glashen first to Newington House, the seat of the Right Hon. the Lord Provost, where some large plants, consisting chiefly of Hollies and Portugal Laurels, had been transplanted during April, 1853. Here the committee examined the roots of two of the shrubs lifted, the first being a Holly 16 feet high, with a stem 18 inches in circumference, raised with the 3-feet lever power transplanting spades. This plant had many cut roots half an inch in diameter, and from their extremities numerous tufted rootlets in a healthy condition were seen varying from 5 to 8 inches in length, all made during the past summer. The second plant examined was a very old and stinted Portugal Laurel, 12 feet high, with a stem 3 feet in circumference, lifted by screw power, with a 5-feet ball of earth. This large shrub has not made much progress. The cut roots examined were in a satisfactory condition, one root, 3 inches in circumference, had numerous rootlets, from 3 to 4 inches in length, proceeding from the cut extremity. The subsoil at Newington House from which the shrubs were lifted, consisted of a strong, red, rotten, rocky clay. The committee next proceeded to Prestonfield, the seat of Sir William Dick Cunyngham, Bart., where 45 shrubs had been transplanted during April, 1853, 15 of them being of large size, consisting of Hollies, Cherry or Bay Laurels, and Portugal Laurels. All of them were found to be in a very healthy thriving condition. Some of the Bay Laurels were about 30 feet in circumference of branches, and 8 feet high, and had been lifted by the 3-feet lever power spades, from a deep rich loamy clay soil, which adhered firmly to them. The roots of a Bay Laurel examined had made numerous healthy fibres, from 12 to 14 inches long, from various sized cut surfaces. A large green Hedgehog Holly, 12 feet high, and 16 feet in circumference of branches, lifted by the 3-feet lever power spades, had also healthy new-made fibres proceeding from the sides of numerous cut roots, half an inch in diameter. From Prestonfield, the committee went to Campie Musselburgh, the seat of G. L. Hay, Esq., where upwards of 500 trees and shrubs of various sizes had been operated on during the spring of 1853, only four of which had failed. The soil at Campie is of a deep very light sandy nature. The roots of all the plants appeared in a healthy state, and the growths made during the past season were very satisfactory. At Campie only one deciduous tree was examined, viz., a Sycamore 12 feet high, with a stem 21 inches in circumference. Some of the cut roots, upwards of 1 inch in diameter, were covered with numerous recently made fibres 14 inches long. From Campie, a deputation of the committee proceeded to the Edinburgh Cemetery, where a large number of trees and shrubs were pointed out as having been transplanted with the patent spades. All were in a highly satisfactory state. The plants selected for examination were a Spruce Fir and a Scotch Fir. The former 6 feet high, lifted with the 2-feet transplanting spades, had made roots 15 inches long; and the Scotch Fir, 8 feet high, lifted with the 2-feet spades, had made new roots 25 inches long during the last 10 months.

March 9, 1854.

This day a deputation of the committee, accompanied by Mr. M'Glashen, proceeded to Cramond House, the seat of C. F. Inglis, Esq., where a Sycamore was lifted last March with a strong screw transplanting machine, the ball of earth and roots being 10 feet in diameter. The Sycamore tree was 53 feet high, with a stem 5 feet 4 inches in circumference, and when raised with the ball of earth weighed about 14 tons. The cut roots examined on the 9th March varied from 1 to 3 inches in diameter, and all of them were covered with recently made tufted roots, varying from 7 to 10 inches in length. A Beech tree 19 feet high, with a stem 17 inches in circumference, lifted with the 30-inch patent spades, had also healthy new-made roots 18 inches long. The buds of the transplanted Sycamore and Beech, when compared with the untransplanted ones in the neighbourhood, presented no perceptible difference. From Cramond House the deputation proceeded to examine a variety of trees in the extensive nursery establishment of Messrs. P. Lawson & Sons, consisting chiefly of Deodars, Taxodium sempervirens, Pinus Laricio, and evergreen Oaks, in sizes varying from 3 to 14 feet in height, all lifted with the 2 feet and 2 feet 6 inches transplanting spades, and many of them operated on during midsummer. These plants were all in a healthy vigorous state. In the nursery grounds of Messrs. J. Dickson & Sons, of Inverleith, several plants of Arbutus, Alaternus, Sweet Bays, Irish Yews, and a variety of other shrubs, varying from four to eight feet in height, all transplanted with the 2-feet patent spades, likewise proved satisfactory to the committee. In the Royal Botanic Gardens, a considerable variety of Coniferæ, also many evergreens and deciduous shrubs, were transplanted with the patent spades from 15 inches to 4 feet, during the spring and summer of 1853, and all were found to be in perfect health. At the experimental garden, a Deodar Pine 12 feet high, with a stem 14 inches in circumference, and 9 feet 5 inches in diameter of branches, lifted with the 5-feet screw-transplanting machine, in December, 1852, was also in a highly satisfactory condition.

Such are some of the data upon which the committee have founded their opinions of the success of Mr. M'Glashen's method of transplanting. They believe that his transplanting spades are well fitted for the purpose, and from their easy application, are likely to be extensively employed. The results, so far as the formation of roots and of wood is concerned, appeared to the committee to be highly satisfactory, and they have no hesitation in calling the attention of horticulturists to the value of Mr. M'Glashen's patent.

Excerpt from Minutes of a Meeting of the Council and Committee, held 16th March, 1854, J. Hope, Esq., V.P., in the Chair:—

"A Report (of which the foregoing is a copy) having been read from the Committee on Mr. M'Glashen's Patent Transplanting Apparatus, was approved of and sanctioned, and the Secretary was requested to transmit a copy of the same to Mr. M'Glashen.

(Signed) "J. H. Balfour, M.D., Secretary."

Home Correspondence.

Himalayan Walnut.—In answer to your inquiries as to the value of the Walnut-tree wood in the Himalaya, I have to remark that it varies extremely in different parts of those mountains. My own experience is confined to the Sikkim Himalaya, where the Walnut inhabits mountain slopes at 4000 to 7000 feet elevation, forming a middling-sized tree; but, from the denseness of the forest, never assuming the rounded form that it does in this country. Its wood is pale, soft, and spongy, as compared with the European; it does not take a good polish, but otherwise is of fair quality, not warping or splitting under ordinary circumstances. Soon after the establishment of Dorjeling it was recommended that Sikkim Walnut-wood should be used for gun-stocks, and a considerable quantity was thereupon sent to Calcutta and, I believe, also to England; but it was pronounced (justly, I believe) worthless for the purpose, being deficient both in hardness and weight. I have had a box, in use for now six years, made from a well-selected and seasoned plank of Sikkim Walnut; it has stood a great deal of rough usage, though the wood is so soft that I can drive my nail into it. The Walnut is equally common in the north-west Himalaya, extending from Sikkim, probably the whole way to Persia; and in Kashmir and Affghanistan the wood is justly prized for gun-stocks beyond any other. Such difference in the quality of timber of the same species of tree, accompanying differences in soil, climate, and exposure, are very familiar to all timber-cutters in India, but are, I believe, very partially appreciated in this country. A very few Indian woods, and those of peculiar weight, hardness, and durability, are always worth felling, such especially as Sal, Teak, Mesua, Ebony, &c.; but even amongst these the differences are very considerable. I have lately conversed a great deal with an experienced timber-cutter, who was professionally engaged for many years in the Nepal and Sikkim Terrai, in felling Sal alone. He assures me that the quality of that wood varies to such a degree that he has sometimes met with a clump upon which the woodmen's axes have been literally broken to pieces, obliging him to send to Calcutta for a complete new stock. This was the case with tools which had stood ordinary usage for many months, and had been employed to fell no other wood but Sal. My friend informs me that generally speaking he could account in some measure for the extraordinary hardness of such clumps, by soil or exposure; but he never could predicate of a tree whether it would be hard or soft with any certainty before the axe was put to it. Generally speaking the best Sal wood grows on dry gravelly spurs and rocky slopes. In the latter situation, however, the trees too often become gnarled; in low moist situations the timber is softer, but much depends upon drainage and other qualities of the subsoil, which it is impossible to ascertain in the forest. The above remarks are also applicable to the Deodar wood, about which I have a few observations to offer on a future occasion; meanwhile I may say that I entirely agree with Mr. Strickland in considering that we are not warranted in concluding that it will be a profitable tree in this country, though it is well worth a trial on a limited scale. *J. D. Hooker.*

Grape Growing.—I send you a list of the weight of Grapes cut in an old lean-to house here during the last four years. I may say that for years there were not 12 lbs. of good Grapes cut in it; and as it has been brought to its present state of fruitfulness by following the directions given in your Paper, I think it right to give it publicity. The house is 36 feet long, 11 deep, and 13 feet high—no other fruit in it except Grapes, which are principally Black Hamburgh, and trained on the rod principle. Last year was the first year there was any fruit on the back trellis, the Vines having been only planted on it the year before. The produce was as follows, all carefully weighed, and good weight given :—128 lbs., 1850; 158 lbs., 1851; 201 lbs., 1852; 234 lbs., 1853. *E. F. L., Donaghadee, Co. Down.*

Commemorative Trees.—In England there yet exist trees that point back to the manners of our ancestors—such as the Gospel Oaks, under whose shade our forefathers were accustomed to assemble to hear sermons; in the same manner as at a later date our markets and other crosses were the sites selected for religious instruction to the assembled crowd. It was at Paul's Cross that one of the brightest ornaments of our church had nearly lost his life by the exposure to rain and wind, and having recovered from his illness, in the gratitude of his heart offered to do anything which his careful nurse and landlady demanded of him, in return for her unwearied attention. She said "marry my daughter," and the divine obeyed the mandate. This anecdote is merely introduced to show at how recent a date preaching in the open air was common in England, and as we may suppose that in country places the practice of preaching under trees might have continued long after it had been discontinued in towns, there seems every probability that those venerable remains, joying in the distinction of Gospel Oaks, were in the lusty vigour of their manhood, so to speak, the identical trees selected, and thus traditionally confirming a curious phase of our history. Herne's Oak, that thousands as well as myself have made a pilgrimage to see, as is well known, is not the veritable one (it is a pity to know it), but the one that was uprooted in George III.'s time in all probability was that tree of some ghostly legend in the time of our Shakespeare, and which, owing to the merry wives' conceit, had preserved its identity almost to our own times. Nor can we forget the Mulberry planted by the bard's own hands; and it takes a vast effort to forgive its ruthless destroyer. How much pure gratification has he deprived not Englishmen alone of, but the cultivated and refined of

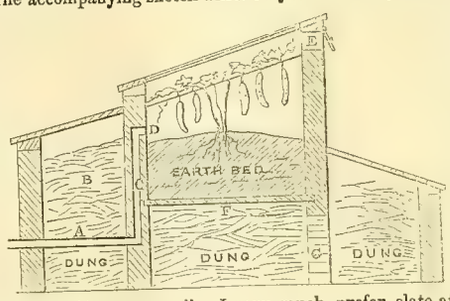
all nations. The circumstances alluded to are of national interest; but how many thousand commemorative trees exist that are of family notoriety only? and to such most deeply interesting. A knoll upon an estate, where I have recently been employed, is called "Bunker's Hill;" and upon comparing the age of the Elm trees, with the date of the engagement, I find a very near approach to years and annual layers of woody accumulation. I will give one more instance of a family nature that I was connected with; a friend of mine had been married to his wife 50 years; there was a gathering of sons and daughters and grandchildren, and each one assisted to plant an Oak in such a manner that the whole should ultimately form a striking group in after years. Each of these trees were known to persons on the estate by the names of the persons who assisted to plant them. It has occurred to me that persons having gardens might make them of deeper interest by the power of association, and, by way of illustration, I will relate what has occurred to myself. Some years agone I was conversing with the late Sir William Garrow upon the delight I felt in possessing any plant that was mentioned by Virgil; he said he could add to my collection by giving me a plant of Bay that was taken from his tomb. I possess the plant yet, and it slightly differs from that in common cultivation. Napoleon Willows will become in fashion again if the President maintains his friendly position with England; for everything relating to his uncle is with a large party in France at present in high estimation. The late poet laureate Wordsworth, the author of that noble poem, "The Excursion," and the "Prelude," not enough known—the author of the lyrical ballads—sent me a Laurel from Rydal Mount, which I need not say I cherish. More recently Sir Robert Inglis, with great kindness, gave me plants brought from the Holy Land—indeed from the garden at Nazareth. I mention these as proofs of the additional interest a garden may be made to afford, and how it may be made conducive to all that is ennobling and good. *William Masters, Canterbury.*

Bees.—A few golden rules must be observed to secure success in bee keeping; one is, that damp is one of the greatest enemies of bees. A damp floor-board ought to be removed immediately, and replaced by a dry one, to which a light hive ought to be tied down. When bees lie on the floor-board 24 hours, they must be dead, and should be removed; and if the bottom of the combs is very moist and mouldy, I would advise turning up the hive in a warm, sheltered place, and with a very sharp knife cutting off the mouldy part, employing that right hand of the practical apiarian, a puff of tobacco smoke among the combs. Feed, if possible, at the top; it will raise the spirits of the workers, and stimulate the queen, if she is safe; if she is not, the life of the hive is gone, and its days are numbered. The numerous complaints of the loss of hives during the last unfavourable season seem to indicate a misapprehension of the physiology and habits of the bee, leading to the idea that bees are torpid during winter; whereas, they consume food, and maintain a temperature of about 80°. To insure their safety, I weigh my hives in September; if they have more food than sufficient to carry them through the winter, they are welcome to it, they have worked for it, and it is their share of the partnership; if they are too light, as I do not expect profit without outlay, I supply food as rapidly as possible. The quantity necessary for winter store varies greatly in different localities, even of England. In Kent, 10 lbs. are considered sufficient, in Northumberland, they are not safe with less than 20 lbs. This is the plan I adopt, and I never lose a hive nor feed during winter; but should I find a hive light in February, I would pour a pound or two of syrup into the side combs, as recommended by Mr. Golding. Perhaps, the best advice I can offer is, study the "Shilling Bee Book." *C. H.*

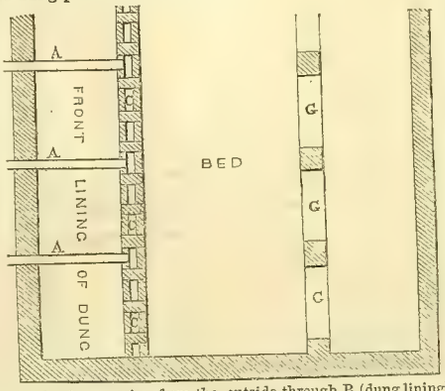
Deep Soiling Potatoes.—Since this method of preventing the disease appeared in your Paper of the 18th February (see p. 101), I have received so many inquiries respecting the distance I put the rows apart, and how much of the foliage is covered in the after management, that to save myself trouble I would feel grateful for your publishing the following:—I plant strong-growing varieties in the usual way, 3 feet apart; early sorts or weaker foliaged kinds, 2 feet 6 inches, and 2 feet 3 inches for field culture, will give sufficient room to operate upon them in the way I have found to preserve them. In earthing, I do not cover more foliage than is necessary, but I turn that all on one side. The rows having been well earthed up with the hoe, I dig out between them nearly a spit of soil, which I lay in a ridge on the top of them, so that the foliage, as it were, hangs out of a bank. At planting time, the sets are covered over only about 2 inches, and they stand 12 inches apart in the drills. I am glad to see it mentioned that the Horticultural Society has planted some Potatoes on this plan, with a view to test its efficacy. Wait till the Potatoes have arrived at some considerable size, then dig down beside them, pit them up, and you will have a sound crop. The digging down between the rows drains them at the bottom, and by placing the soil on the top in a ridge, the rain is thrown off the crop, which thus has a comparatively dry bed. *Charles Alborough, gardener to G. S. Kett, Esq., Brooke House, Norwich, Norfolk.*

Hartley's Rough Plate Glass.—About four years ago I had two small houses glazed with this glass, one for Ferns, the other for miscellaneous plants. To the former house I could of course give very little ventilation, and it certainly became warmer than it would have been with clear glass; scorching consequently ensued, but the application of shades (inside) at once remedied the evil, and I have not since had the slightest reason for complaint, although with clear glass I did not always find similar shading a sufficient protection for Ferns. The other house was exposed to the full force of the sun, and although I did not use shading at all, I never saw a plant scorched, nor do I remember to have seen even the growing wood of a Camellia droop, and all my plants were as healthy and short jointed as any one could desire. Great attention should be paid to ventilation, especially at the highest part of the house, as heat accumulates as soon there under rough plate as under clear glass. After four years' experience I have found all the merits attributed to this kind of glass fully confirmed, and I cannot but think that the failures now and then noticed in regard to it arise from want of sufficient ventilation, at least in the case of houses used for ordinary plants, and from not providing suitable shading when the nature of the inmates require them to be kept close. *R. White, Camberwell.*

Cucumber Pit heated by Dung only.—Thanks for your too flattering mention (see p. 19) of my system of ventilation. I have received sundry applications for advice, which I am, of course, happy to give as far as I can. A friend has asked me for a plan for dung heat only, the back of his pits being near his stable yard. The accompanying sketch will show you the result, which



I fancy will answer well. I very much prefer slate at the bottom of bed, as it enables you to renew the dung at pleasure, while it avoids the danger of burning. If a supply of ammonia is required, it may be had at pleasure, by a small perpendicular pipe passing from the dung-pit below. *T. P.*



A, air pipe, passing from the outside through B (dung lining), into C (front wall, built of brick 9 inches thick, hollow, the bricks being set on edge, leaving an air chamber within. This is delivered at D, an opening on the inside 9 inches by 5 inches under each light, covered with perforated zinc. The heated air passes off at E, ventilator in the back. The bottom heat is supplied by fresh dung introduced through G G, arches in the back wall, under the slate which supports the bed.

Structure of Zingiberaceæ.—I have recently been thinking a good deal over the structure of the flowers in the Zingiberaceæ and allied families, and I fancy I have fallen on the proper explanation of it. It is somewhat different from the one you have offered in the "Vegetable Kingdom." I take the anthers (in Kæmpferia, for instance) to be composed of the approximated halves of two contiguous anthers; the so-called inner petals being the other halves; the labellum to be the third anther. We shall then have an inner series, consisting of a fertile and two barren styles. The next

Diagram of the Flower of Kæmpferia.

1st, or outer series, three sepals; 2d, ditto, three petals; 3d, "anther," "petals" (inner), and "labellum," three stamens—nearly altogether petaloid; 4th, "style" and "appendages," three styles—two barren.

series, alternating with the above, consisting of three stamens, all but two halves petaloid. Alternating with these a row of petals, and outside them the sepals. Adopting this view, in the Orchideæ we should have, as you have suggested, to consider the so-called sepals to be the petals, and the anther, petals, and labellum, the staminal series of three stamens, as in Kæmpferia. The sepals being adnate to the ovarium gives probably the appearance of the latter being composed of six carpellary leaves. The fact of the pollen-masses being united to one gland is no argument against my view, as we have a somewhat similar thing in the Asclepiadaceæ. I inclose a little diagram to explain my meaning. *G. H. U. Thwaites, Peradenia, Feb. 9.*

Coniferous Trees.—I am glad to find that you confirm the good opinion I have always entertained of the Corsican Pine as a timber tree. With regard to the Pinus Douglasi I fear you are mistaken in regarding it as a quite hardy tree, at least I have found by repeated trials that it will not stand the winter of this midland county when planted as single trees, and even when not placed in exposed situations. But with sufficient shelter from other trees it does well. Of the Deodar, I have a better opinion than of the P. Douglasi, but to grow with a straight stem it had need be planted thickly, I believe, with other trees, as one that I have standing singly (about 25 feet high) is sadly twisted from bottom to top, though it is still a very ornamental specimen. Cupressus torulosa is quite hardy here, and is a beautiful species, though not so vigorous in its growth as C. macrocarpa, which is also hardy. Taxodium sempervirens, which is stated in your columns to be hardy, I have not found to be altogether so. *W. H., Oxfordshire.*

Fungals.—The following very interesting information has been forwarded from Florence, to Dr. Seeman, dated Nov. 16, and has since been published in "Bonplandia" of Dec. 15:—"Prof. Amici authorises me to publish a very interesting observation he made a short time ago. As you well know, the professor has been very assiduous in studying the disease of the Vine; and the better to study the Oïdium, its supposed author, he reared it on plates of glass with a little water. Now it so happened that several other minute fungi were found to vegetate at the same time on the glass plates, and amongst them one peculiar species, consisting of very slender filaments, from which rose rounded sporangia, supported by short stalks, each of them containing a great number of minute oval or oblong spores, animated by a motion exactly similar to that of the zoospores of seaweeds. The sporangium bursts after some time like a soap-bubble, and throws out the spores all in a heap, and when once extended, their motion ceases immediately; they are perfectly smooth, without anything like vibrating ciliæ. Their length is 0.0035 mm; their breadth, 0.0014 mm; the breadth of the largest sporangia, 0.0215 mm; the breadth of the filaments, 0.0014 mm."* It has escaped the notice of Professor Amici that a somewhat similar phenomenon was observed in a fungal published and figured several years since in "Hooker's Journal of Botany," vol. iii., 1841, under the name of Endodromia vitrea. It grows in woods, on smooth, fallen twigs, especially of Ash, and is so delicate that it requires some care to take it home in a fit state for examination. The globose hyaline sporangia are in this case filled with hyaline globose spores, each of which contains a single nucleus which moves about with great activity within its mother cell. The spores are accompanied by a few delicate threads, and the peridium breaks up when placed in water into a multitude of granular fragments, the nuclei frequently becoming free. It is to be observed that in neither instance is the motion merely molecular, as should seem to be the case in the young Aregma observed by Unger, and in the cystidia of Lecythea, according to my own recent observations. In like manner the granules of the blood rain possesses apparently merely molecular motion, but the production requires further study, as, according to the observations lately published by Mr. H. O. Stephens, in the "Annals of Natural History," it is possible that a second and larger form of fruit may occur; for the bodies which he has figured as seen not only by himself but as exhibited to numbers at the Bristol Institution, are mountains compared with the incommensurable granules which alone were supposed to constitute the blood rain. If my conjecture be right, that the mould which occurs so frequently on animal substances under water, and which is known under the name of Leptomitus, be only a condition of some Mucor, as seemed long ago indicated by the observations of Carus, though he deduced from them an inference in favour of the doctrine of spontaneous generation, and not of the different forms of fruit which the same production may assume under different circumstances, we shall then have zoospores in fungals as well as Algæ furnished with long flagelliform processes. It is, however, to be observed that the blue colour assumed by the cellulose of the Leptomitus, when immersed in iodine and sulphuric acid, is different from the tint of the threads of Mucor when similarly treated. *M. J. B.*

Larch Timber, English or Foreign.—In the report of the last meeting of the Horticultural Society I see a statement of the exhibition of a block of British-grown Larch, 2 feet in diameter, exhibited and compared with a piece of American Larch, to show the difference (and, I presume, the inferiority) of the British-grown. Is there reason to suppose that the two specimens were the same species? The Hackmatack, or, as it is called by Loudon, the Tamerach or American Larch, is very rare in England, at least large specimens of it are;

* There must be some error in this last number, as it accords with the breadth of the spores, which is not very probable.

and, unless very satisfactory evidence be given on the subject, it seems highly improbable that a block of American Larch, 2 feet in diameter, should have been produced from a tree grown in Britain. Michaux, quoted by Loudon, gives that as a large diameter for an American-grown specimen. If the wood was the European, not American, species, the comparison was futile. With respect to the quality of British and foreign-grown timber of the same species, I would remark that there are few Larch in Great Britain, except those at Dunkeld, old enough to exhibit the true character of their wood. The dark-coloured, close-grained Italian Larch is the produce of very old trees; and I suspect it does not assume that character under 150 to 200 years. I once saw a butt of Larch near Samaden, in the Ober. Engadin in the Grisons (the great region of European Larch), which was about 6 feet in diameter. I counted its rings till they became too close to distinguish, and then measuring inwards and counting back, allowed as many for the uncounted space as occurred in that which I could count; this reckoning gave 560 years as the age of the tree, and it was still perfectly sound. I saw some growing apparently about the same size; they had columnar stems, nearly cylindrical, and flat umbrella-shaped heads—not a branch within 70 or 80 feet of the ground. *J. R.* [The specimen of American Larch here alluded to was produced to show its difference from European Larch, and its similarity to Deodar.]

Foreign Correspondence.

Shanghae, January 17, 1854.—While on the subject of dyes, I may mention to you that Mr. Fortune has been fortunate enough to discover some plants of the green Indigo (so called) which the French chemists and manufacturers are hunting after. M. Persoz says he has seen a small sample of the dye—that with certain mordants it produces a colour of great beauty and permanence, and that such a colour is unknown in Europe. Mr. Fortune returned to this port a few days since with a large collection of tea seeds and plants, as well as seeds and plants of useful and ornamental things likely to meet the climate of India, and he is now sending them onward. Luckily for him the rebels have kept out of the Tea districts, and have not interrupted his operations. Shanghae is still in a dreadful state—here we have fighting every day—we hear the balls whizzing over our heads; on several occasions they have struck the foreign houses, but no foreigner has as yet been wounded. Chinese fights are most amusing performances, and were it not that the loss of life is considerable, the scenes would be quite laughable. Whatever the real rebels are, the fellows here are a set of rascals, and yet the sympathies of most of the foreigners, and nearly all the missionaries, are on their side. How to account for this, I confess is quite beyond my power.

Societies.

Linnean, *March* 21.—The President in the chair. F. D. Dyster, M.D., and J. T. Syme, Esq., were elected Fellows. Among the presents announced were a series of about 60 species and varieties of British and Scandinavian Hieracia, presented by D. Oliver, jun., Esq.; and Spathelia simplex, Macfadgen (not Lam.), the Mountain Pride of Jamaica, presented by Dr. Alexander. Mr. S. Stevens exhibited a specimen of a species of Nepenthes, collected by Mr. R. W. Plant, in the Seychelles. It was stated that living plants of this Nepenthes were on their voyage to this country; and Dr. Hooker remarked that it was apparently a new species, allied to N. phyllamphora. N. B. Ward, Esq., exhibited living specimens of Gymnogramma leptophylla, grown in a closed case, and produced from soil taken from its native habitat in Jersey, in September, 1853; it was remarked that, grown under these conditions, the plant attains a larger size, and continues fresh much longer than in its native locality. [This fact furnishes a hint as to the most convenient way of importing many of the fine tropical Ferns not yet in our gardens. The soil about their roots must be filled with their spores, and a small portion of this preserved in a close bottle, and spread out on its arrival here, in a close case, could hardly fail to produce plants of the Ferns]. The following papers were read:—1. "On the genus Myrmica and other indigenous Ants," by J. Curtis, Esq. In this paper, the author described several English Myrmicæ, which were either new or little known. The descriptions were accompanied by some beautiful drawings. 2. "Notes on the Habits of the common Garden Ant (Formica nigra, L.)," by G. Daniell, Esq. The author had observed the ants feeding apparently on the excrement voided by the Vine Coccus, and on a similar matter about the green aphides on Calceolarias and similar plants. While observing this, he noticed that the ants also attack the aphides themselves. "In the spaces between the pots, on the square tiles which cover the flue," he observes, "I noticed ants running to and fro in a rapid manner, crossing and recrossing as a dog tracks the field for game; and curious to ascertain the reason for these evolutions, I turned my attention to those ants which were above in the foliage of the plants. The aphides were seated in comparative safety among the long hairs on the leaves, but it was evident that, while some of the ants were apparently feeding, others were striving to dislodge an aphis from its leafy stronghold; the evidence of this being that, as the ant approached, the aphis put out its legs to parry the attack. To test this, I shook the plant and dislodged some of them, when it immediately became evident what the ants below were scouting for. They at once set upon these fallen aphides, appearing first to break the legs and strip the wings off their victims, and then carry them off."

Reviews.

Les Maladies des Pommes de Terre, des Betteraves, des Blés, et des Vignes de 1845 *à* 1853, *avec Indications des meilleurs Moyens à employer pour les combattre.* Par A. Payen. 12mo, pp. 200, tab. 5. Paris 1853.

We should be truly thankful to find matter provided for our railway travellers equal to that which is contained in the little unpretending volume before us, and that which we lately noticed. M. Payen needs no recommendation from us, for his reputation as that of a skilful chemist and botanical analyst is witnessed by the admirable memoirs which have long since proceeded from his pen; and it is no small praise that he has thus condescended to cater for the instruction of the public. Much novelty is not to be expected in a field which numbers so many labourers; we do not, however, recollect having seen any description of that peculiar disease of Wheat which he describes under the name of piétin, and which is the more interesting because it has occurred more than once in England, having been communicated by Prof. Henslow and Miss Molesworth, though by some accident it has not been described in our pages. A portion of the account given by M. Payen will present a suitable extract, and at the same time afford information which is at present inaccessible to the English reader.

"The disease first appeared about the 10th or 20th of June, 1851, in several distinct localities, at which time it was already clear that the abortion of a large number of ears, or at least the discoloration of a part of their spikelets, was coincident with the occurrence of brown spots at the base of their stems (upon the first or second internode), a cryptogamic malady distinguished by the peasants by the name of piétin, because of the part of the stem which was the subject of attack. At a later period, however, the affection, which had been rapidly developed under the influence of predominant moisture, had ceased, or at least considerably moderated its intensity, under the contrary influence of the succeeding drought, and had allowed the grains to be developed, and the ears in great measure to be filled. There was reason in fact to hope on the 16th and 30th of July, when the matter was reported by M. Pommier, that its cessation would admit of an average harvest. The disease reappeared in 1852, appearing, as before, upon the first or second internode, sometimes simultaneously upon both.

"The malady was recognised at first by the brown tint in the interior of the diseased stems. This tint gradually became deeper, the circulation of the sap seemed to be impeded, the spikes remained short and slender, the organs of fructification more or less completely abortive; the grains small and wrinkled when dry; while the stems were gradually more and more changed under the influence of rain, moisture, and heat, and became brown through their whole extent; so that nothing but meagre grains and inferior straw could be expected from the plants which had ceased to live before they had accomplished the successive phenomena of vegetation, or had attained maturity.

"At this period the cavity of the diseased internodes presented a white filamentous mycelium, which seemed to have originated within under the upper knot of the part attacked, descending thence into the cavity between that and the lower knot, in general for about half its length.

"Observations on the 3d of August showed things in the same state, except that the progress of the evil was characterised not only by the brown colour of the greater part of the large cells, but by the impaired condition and brown tint of a portion of the walls of the vessels, some of which contained in many places a brown liquor filling completely the tubular cavity.

"A comparative examination of the sound and diseased stems, by M. Wartz, gave—

	Sound.	Diseased.
Carbon	46.549 ...	46.707
Hydrogen	6.042 ...	6.146
Nitrogen	0.380 ...	0.825
Oxygen	47.029 ...	46.000
	100.	100.

The principal difference is in the nitrogenous matter, the sound Wheat containing 2.47 per cent., while the diseased contained 5.36.

"It is worthy of remark that the substances introduced by the bodies which attack Potatoes destroying their fecula, by those which are developed on manufactured sugar to its destruction, and finally by the different parasites which attack bread and certain vegetable products—have always the effect of causing nitrogenous organic matters to penetrate into the subjects of attack, and to consume the ternary non-nitrogenous bodies (as fecula, glucose, sugar, cellulose, &c.), which gradually disappear, by transforming them into water and carbonic acid."

Some other matters might be selected which are not familiar to English readers, but our limits only admit of indicating sources of information, and not of giving perfect analyses of the contents of the books under review. The chapter on Beet-root and its diseases may, however, be pointed out as especially deserving of notice; and some of the less generally known affections of Potatoes, to the accuracy of which we can speak, as we have long since been favoured with specimens.

Garden Memoranda.

Horticultural Society's Garden, Turnham Green.—That the progress of vegetation has been slow this spring is proved by the Almond and Cherry Plum, which are only now in full flower, whilst some seasons they have been as profusely covered with blossoms by the beginning of March; and, with the exception of Gooseberries and Currants, which are at present nearly in full flower and leaf, the development of young foliage is comparatively backward. This retarded growth, we need not say, is, however, very favourable to fruit crops, for it is well known that the longer the flower buds remain dormant the less are the blossoms likely to be cut off by late frosts. Peaches on walls are in full flower, and are protected by 9-inch coping boards by day, and straw mats at night. The latter are made of Wheat straw laid lengthwise, and fastened together with tar twine. They are about 3 feet in width, and are fixed to the wall above the trees, off which they are kept (at an angle of some 45°) by means of long inch-square laths, which are placed against the wall for their support. Other trees for which protections of this kind could not be found were covered with common twine net. Apples promise to be a heavy crop here this year, but the blossoms of some Pears are scanty. The young Cherry trees in the orchard which were planted against espaliers in 1850, have now reached the fourth rail, and are covered with fruit buds. Trained in this way they occupy little space, and they are easily netted, so as to keep the fruit from birds. Other kinds of fruit trees planted at the same time have also made satisfactory progress. They are all being pruned and trained, preparatory to having the ground in the orchard dug. The Rose house, which we stated last month was to be converted into an orchard-house for the accommodation of fruit trees in pots, has now received its intended occupants, which consist of 34 Vines, 9 pyramidal Pears, chiefly Belgian; 5 Figs, 3 Plums, including Cabool Greengage, Dowling's, &c.; 3 Apples, and one or two seedlings from the Stanwick Nectarine. All, in fact, consist of the newer sorts of fruits, of their respective kinds, which have been put into this house, not so much to show what the capabilities of such an erection are in the way of cultivation, as to prove the value of the fruits that have been placed in it. While speaking of new fruits it may perhaps be as well to mention that the trial ground contains Apples, Pears, Plums, Cherries, &c., to the amount of upwards of 700 trees, many of which promise to produce fruit this year, and therefore, should the season keep favourable, there will be an opportunity of proving them, which late spring frosts during several years have prevented.

The Roses, which have been moved out of the Rose house and planted in Messrs. Hartley's specimen Conservatory, are pushing vigorously, and bid fair to succeed better than they have ever hitherto done. The beds in which they now are are flat, which is considered to suit them better than the raised beds of the orchard-house. A group of low standard Bourbon Roses, that have been wintered in a cold frame with their roots among ashes, has just been planted in the arboretum, where they are fast starting into growth. These are intended to be taken up late in autumn, wintered in the same way, and planted out again in spring; and thus they are to be treated every year—a kind of management that keeps them safe in winter, and under which they are reported to bloom well in summer.

In the various plant-houses, floral beauty is, as a matter of course, increasing with the advancement of the season. The white and red Brugmansias in the great conservatory are especially worthy of notice, being huge trees loaded with hundreds of long trumpet-shaped blossoms. These, together with Acacias, Camellias, and many other showy shrubs, render this house at present well worth inspection. In one of the stoves Citrus japonica, the Cum-quat of the Chinese, is ripening its small oval orange fruit, and in a cool pit the Sikkim Rhododendrons glaucum and thæflorum, are in blossom. The former has little pink bell-shaped flowers, five or six in a cluster, while those of the latter are white and rather more numerous. Erysimum Arkansanum was also in bloom here. It is yellow, and smells strongly of honey, but appears to be of no particular value.

In the American garden the Rhododendrons are well set with bloom, the beds have been dug, and what few plants that were killed by frost removed. Among the latter must be mentioned Dracæna indivisa, which has not stood the winter here. A whole row of Eucalyptus globulus, the kind of gum tree which furnished the large timber that excited so much attention in the great Exhibition of 1851, has been killed by the last severe winter. These were planted along the face of a bank some three years ago, and were most of them trees varying from 10 to 15 feet in height.

The arboretum has all been mown; its beds and borders are being cleaned and put in order. The plants on the conservative wall are being trimmed, and the ornamental department generally begins to put on the cheerful aspect of spring.

We find that Mr. Matteo Botteri, the Society's new collector of plants, has arrived from Dalmatia, and will be dispatched to Mexico at the earliest possible moment after the necessary preparations are completed.

FLORICULTURE.

TREATMENT OF BALSAMS.—The Balsam is easily and speedily grown, but like many other plants it is often indifferently managed, and unless properly attended to it is very apt to "draw." Being a successful cultivator and exhibitor of this flower, I will offer a few remarks respecting the manner in which my plants are treated. For early blooming I sow in April for general show in May and June, in a gentle bottom-heat, using small thumb pots, and putting one seed in each pot. Place them as near the glass as possible, in order that they may come up strongly. As soon as they are sufficiently large to handle, pot them into 4-inch pots, using plenty of drainage; a frame that can be raised as the plants progress will be found the most suitable for them; but care must be taken to exclude all steam. The plants should be placed in a gentle bottom-heat and set as near the glass as possible, admitting all the air possible in mild weather; for if once they get "drawn" they will never recover so as to make handsome plants. The syringe should be freely applied, as they are liable to be attacked by red spider, and on fine mornings and evenings a watering-pot with a small rose should be used freely over them, as all possible means should be employed to keep the red spider and green fly in check; should the latter prove troublesome syringe well with tobacco-water, as smoking injures the plants, unless great care is taken to prevent it. As soon as they have filled their pots with roots, give them a shift into 6-inch pots, keeping the seed-leaves not more than half an inch from the top of the pot; still retain them in a gentle bottom-heat, and as near the glass as possible. The next shift should be into 8-inch pots; still continue to use the watering-pot over the heads of the plants. If large specimens are required, they should receive a liberal shift, more or less, according to the size you intend to grow your specimens, still keeping the seedling leaf not more than 1 inch above the mould. As the Balsam throws out roots freely from the stem, it will be benefited by being sunk deep in the pots at the last shift. All the early flowers should be pinched off. If intended for large specimens, and if dwarf handsome plants are required, tie a piece of matting round the pots for the purpose of neatly regulating the shoots by tying them down to it. By this method they are induced to form beautiful bushes with but little extra trouble. Plants sown in June may be grown on an open hot-bed, but it should be slightly shaded from the hot sun, and the plants should never be allowed to want for pot room. If a few spare lights can be procured, a temporary frame should be erected over them, about 4 feet above the top of the plants; this will screen them from bad weather; and still they will have plenty of air, for the sides should be left quite open. This is the method in which my large specimens are treated. The syringe should be applied morning and evening until the plants come into blossom, when they should be removed to the greenhouse, and placed as near the glass as convenient. Those who are admirers of the Balsam, but who have no glass structures for its growth, may nevertheless still possess this beautiful flower, for if a hot-bed is prepared, and covered with light rich soil and rotten leaves, 1 foot or 18 inches deep, and the plants are turned out or sown 3 feet apart, they will make enormous specimens. Care must, however, be taken not to have the bed too hot when the plants are first put out. The beginning of June will be the best time to raise the seed for out-door treatment. The chief points in successful cultivation are the following, viz.:—Never allow the plants to get drawn by keeping them close, and at a distance from the glass; never let them suffer for want of pot room, which is one of the most essential points to be attended to; freely sprinkle them overhead morning and evening in bright weather; never water but when it is quite necessary, for although the Balsam likes moisture, yet it is very impatient of being over watered; and, lastly, the pots should be well drained, this being of the greatest importance, for if neglected they are liable to rot off just above the surface of the soil. The compost best suited to their culture is fibrous maiden loam, leaf-mould, rotten cow dung, and a portion of old mortar rubbish. If the latter cannot be procured, use sharp sand or a few pieces of charcoal, mixed with the soil, using two parts of the former soil. Manure water should be given them as soon as the flower buds begin to make their appearance. If cultivated in small pots, place them in a pan of water during the day in very hot weather. Never discard old seed for new ones, as I have found from experience that the older the seed is, the more double the flowers become. *E. B.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Many of the structures which go under this name are very unfit places for Heaths, being generally too lofty and kept too warm; but such varieties as vernix coccinea, hiemalis, Lamberti rosea, Burnetti Linnæoides, &c., which bloom in winter, when the house is generally kept cooler than at any other season, are invaluable, blooming as they do when well grown most profusely. These varieties should be largely cultivated for the decoration of conservatories, and for supplying cut bloom. They should be cut back severely as soon as they have done flowering, giving them a liberal shift when they start into growth, using rich strong peat; and if they are well attended to during the growing season they will overcome any injury they may sustain through occupying a somewhat unsuitable position while in bloom. What with Azaleas, Camellias, Roses, &c., and a sprinkling of New Holland plants, show houses should now be a blaze of flowers. Let every plant, however, be placed in the most suitable position, and aim at maintaining a pleasing uniformity of arrangement, and displaying the colours to the greatest advantage, bearing in mind that no amount of floral display will compensate for bad arrangement, but will rather serve to make the latter more apparent. Pick off decaying flowers and leaves directly they make their appearance, and endeavour to replace the plants with others as soon as they shall have begun to get shabby. Sprinkle the surface of the beds frequently, so as to assist in keeping the atmosphere moist, and also see that the under soil is kept in a uniformly moist state. Watch for insects, and attack them as soon as they are perceived, which is the only way of preventing their doing mischief. STOVE.—Proceed with the repotting of such plants as require it, and give all necessary attention to those in active growth, using every means to induce rapid growth, combined with strong short-jointed wood. The only way of effecting this is by securing a vigorous root action, and keeping the plants near the glass. Specimens that were started early in the season will require rearrangement, so as to place them in positions suitable to their state of growth. Ixoras, Clerodendrons, Allamandas, &c., "feeling their pots," will be greatly benefited by a careful supply of manure water, but see that it is given in a tepid state. Look sharply after mealy bug and thrips, for if these pests are allowed to establish themselves at this season, they will furnish plenty of work for leisure hours during the summer.

FORCING DEPARTMENT.

PINERY.—Attend to re-potting succession stock as it requires it, but avoid the old-fashioned practice of repotting the whole at once, irrespective of what the state of the roots may be, than which nothing can be more injudicious, particularly in cases where a constant supply of fruit is required. Every plant should be shifted before its roots become too much matted, and no plant should be repotted until it needs it. This requires considerably more time and attention than the practice of repotting all at one time, but the result well repays the extra trouble. The temperature may be slightly advanced with the gradual increase of light, but this is a matter in which the state of the plant will be the best guide. Aim at obtaining strong dwarf stocky plants, and if this is secured, it is immaterial whether the night temperature is 60° or 70°, and very much will depend upon circumstances as to which of them will be proper. Backward plants, if kept near the glass to prevent weakly growth, will be benefited by a temperature, which would ruin those in free growth. Use every means to ensure a healthy root action, and use fibrous soil for potting, so as to be able to supply the plants liberally with manure-water. Keep the atmosphere moist by frequent light syringings, and see that the roots, whether in pots or in a bed are surrounded by soil in a moist healthy state, and there will be no difficulty in obtaining rapid growth. Admit fresh air as freely as the state of the weather will allow, but avoid drying currents, and shut up early in the afternoon. VINERIES.—The Vines in the late house will soon be fairly on the move, and, unless great care is taken at once to keep them back, it will soon be impossible to do so. See that Vines starting into growth are tied up in their places, before the shoots get so long as to endanger their being broken off or injured. Look over houses where the fruit is swelling, and see if any of the bunches would be improved by tying up the shoulders, and let any necessary alterations involving handling the berries be done before they begin to change colour, as it will be impossible to handle them without injury after that is the case.

FLOWER GARDEN AND SHRUBBERIES.

Look over all recently transplanted shrubs and trees, for the purpose of ascertaining whether they are securely staked, for if these are allowed to roll about with the wind the tender roots are broken off, and the plants are consequently deprived of their only means of obtaining nourishment. Now with April showers, and bright and occasionally warm sunshine, we must be in readiness for mowing. Have the turf swept, well rolled, and made thoroughly firm without loss of time, and remember that if the first mowing is deferred till the Grass gets long, it will require much time and labour to get the turf into proper order. Also get the walks edged, and otherwise put into proper order. Attend carefully to the stock of bedding plants, and get rooted cuttings potted off as soon as they are in a fit state, and encourage them with gentle bottom-heat and careful management to make quick growth, for after this season there is no time to be lost with young stock. Calceolarias, if well established, may be planted out in a turf pit in poor sandy soil, where they can be protected from frost or cold winds; but they must be prepared for this by previously inuring them to full exposure to sun and air, &c., whenever the weather will permit. Their place under glass can be profitably occupied with recently potted-off stuff, and with ordinary care they will do better planted out than stunted in small pots.

KITCHEN GARDEN AND HARDY FRUIT DEPARTMENT.

Get in the main crop of Carrots the first fine day, when the ground is in fair working order. Sow in drills and rather thickly, for the quality of seed is said to be bad this season; although, so far, I have no cause to verify the general statement. Attend to keeping up a succession of Peas by planting, every fortnight, a breadth proportionate to the demand. Soil up and stake those above ground, and protect them from the ravages of mice and slugs, which are often very destructive at this season. Blanch Seakale in the open ground by placing inverted flower pots over the crowns, and covering these with light soil, or any material which will effectually exclude light and air. Prick out, on a slight hot-bed, Cauliflower plants raised in heat. The gentle bottom heat will greatly assist in pushing them along, without their being weakly and drawn, as is the case when they are grown under glass. Also prick out Celery on a gentle bottom heat, and protect with a frame or hand-glasses till well established, and sow seed for the main crop. Attend to providing succession crops of Spinach, and keep the surface soil regularly stirred among growing crops; also do not forget small salads, as Radishes, &c., and sow sweet herbs for transplanting.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending March 30, 1854, as observed at the Horticultural Gardens.

March.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Min.	Mean	Of the Earth 1 foot deep.	Of the Earth 2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 3d, 1848—therm. 78 deg.; and the lowest on the 6th 1851—therm. 21 deg.

Notices to Correspondents.

BOOKS: *Sub.* There is no separate treatise of any value upon the use of liquid manure. Abundant discussion concerning it has appeared in our columns from time to time.

CALLA ÆTHIOPICA: *J W.* Where there are plenty of plants this may possibly be had in bloom nearly the whole year round, by forcing some into flower early in spring, and retarding the blooming of others till late in autumn. It will, however, require a season's experience to be able to effect this satisfactorily. ‡

CEMENT: *W C.* Cement the inside with *good* Portland Cement.

GRAPES: *S P.* We know of no reason why the Mill Hill Hamburgh should not do well in the same house with the Black Hamburgh.

HEATING: *W.* Yes. Please send the Holly *at all events.*

HORTICULTURAL SCHEDULE: *A Fruit Exhibitor.* We cannot again go through the calculations, but we have no doubt about our being correct. At all events, according to your own showing, the new schedule is *more* in favour of exhibitors than we had supposed. As to fruit, it has always happened that more is offered than is given; this arises from want of competition; the sum *given* last year, which is a full average, is what is offered this year, and as the giving is at the discretion of the judges, it is needless to offer more than the wants of the exhibitors demand. Have no fear about the judges, they are already provided. You are quite right in regarding the new regulation as a great improvement upon the old one.

INSECTS: *F D., Pershore.* Certainly. The best plan will be to recork the bottles and dip the tops of the new corks in melted resin and wax, to prevent fresh mischief.—*X.* Kolenati has not published a second part of his Trichoptera. Kuster's book is on the plan of Panzer—irregular; 27 Parts, at 3*s.* each, are out. There are not sufficient papers in the Stockholm and Moscow Transactions to make it worth the while of an English entomologist to purchase them. Messrs. Williams and Norgate, or any foreign bookseller will supply the other information respecting these works. Messrs. Barthes and Lowell are now the agents for Guérin's "Revue d'Zool." The Stettin and French Entomol. Trans. are a little behind-hand, but not to the extent you mention. The Blatta is, we believe, undescribed. —*J O.* The French use cords dipped in diluted honey, hung between trees, to entice moths; and the Americans, rags dipped in soap-suds, which have stood in the hot sunshine till they are sour. *W.*

KENSINGTON GARDENS: *D C L.* The names of plants in this resort have been furnished by some ignorant person; they are another instance of the way in which the Woods and Forests are administered. No Laurus is a native of Britain; and there is no such plant as Laurus salicifolia.

LILY OF THE VALLEY: *H C.* The specimen sent is an extremely good one. It appears to have been grown in a 6-inch pot, which it has filled most completely with strong healthy shoots, each bearing a long spike of highly fragrant flowers. The latter, however, evidently require a little fire heat, as you suggest, to bring them nicely out. We shall be much obliged for the remarks you promise respecting the culture of this Lily, which you appear to manage so well. ‡

PINE PITS: *X.* Your plan looks as if it would answer perfectly. We should, however, use 4-inch pipes instead of 3-inch ones, which will be found too small. Lay them in rough gravel at the bottom of the bed, which is quite deep enough. We should also employ 4-inch pipes for the top-heat.‡

RHODODENDRON SEEDS: *Enquirer.* Sow them now in pans filled with sandy peat, and start them on a very gentle bottom-heat. When up transfer them to a cold frame to harden, preparatory to their being placed out of doors.‡

VINES: *J H S.* Out of the long list you sent, four Vines for a small greenhouse may consist of 2 Black Hamburgh, 1 Black Prince, 1 Royal Muscadine. ‖

WHITE FLOWERED PLANTS: *Alba.* The following may possibly answer your purpose: Arabis grandiflora, and white Daisies, for spring; Iberis coronaria, and sempervirens for summer; and white Verbenas, for autumn.‡

MISC.: *Cleaveland.* Messrs. Parsons and Co., Flushing, Long Island, United States; or Mr. Reid, Elizabeth Town, New Jersey.

TO MANURE MANUFACTURERS.

THE Directors of the Crystal Palace Company are prepared to exhibit in the Agricultural Department samples of MANURES and other substances applied to the Soil. The terms, &c., may be obtained on application to the above department at this office.—3, Adelaide Place, London Bridge, April 1.
G. GROVE, Secretary.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures.
WM. INGLIS CARNE, 10, Mark Lane, London.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

PEAT MOSS CHARCOAL, AND OTHER MANURES.—The Undersigned are appointed sole Agents by the Peat Moss Charcoal Company, for the sale of this valuable fixer and distributor of ammoniacal matter.
Also on Sale, Peruvian Guano, Superphosphate of Lime, Gypsum, Nitrate of Soda, Bone-Dust, Sulphuric Acid, and all other Manures of known value.—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

SUPERPHOSPHATE OF LIME MANUFACTURED BY MR. J. C. NESBIT'S IMPROVED STEAM MACHINE. The following is the analysis of an average sample.
"College of Chemistry, Agriculture, and General Science, 38 & 39, Lower Kennington Lane, London.

Analysis of Sample of Superphosphate of Lime from Mr. Jolliffe:

Moisture		13.97
Organic Matter, &c.		21.98
Silica		6.05
Phosphate of Lime		35.27
SOLUBLE	16.10	
INSOLUBLE	19.17	
Sulphate of Lime, &c....		22.73
		100.00
Nitrogen (equal to)		1.16
Ammonia		1.41

(Signed) J. C. NESBIT."

For price and full particulars, apply to E. Y. JOLLIFFE, 70, Mark Lane, or the Works, Lavender Dock Wharf, Rotherhithe.
Agents wanted in all the principal towns.

SEWAGE GUANO, 5*l.* 5*s.* per ton (bags included). Circulars and Testimonials forwarded on application.

DEODORIZING CHARCOAL, 1*l.* 10*s.* per ton (bags to be returned). Terms: Cash on delivery.
The Manchester Sewage Guano Company, 3, Watling Street, Shudehill, Manchester. E. RANSBOTTOM, Agent.
JOHN THOMPSON, Secretary.

PERUVIAN GUANO, WARRANTED OF THE BEST DESCRIPTION, AND THE DIRECT IMPORTATION OF MESSRS. ANTONY GIBBS & SONS; LAWES'S *Patent Superphosphate, Nitrate of Soda, Bone Dust, and all other Natural and Artificial Manures, at the lowest remunerative prices.*—*See* RENDLE'S "FARMING PRICE CURRENT AND AGRICULTURAL DIRECTORY," to be obtained from W. E. RENDLE & Co., Seed Merchants, Plymouth.

THE BRITISH ECONOMICAL MANURE COMPANY supplies in any quantity the "Economical Manure," a complete and by far the cheapest substitute for Guano. 1½ to 1½ cwt. per acre of this powerful Manure, costing 15*s.* to 18*s.*, is ample (more must not be used), and equals 3 cwt. of the best Peruvian Guano, thus saving at least 50 per cent., besides carriage, &c.
The agricultural world is respectfully urged to read the hundreds of Testimonials from all parts of England, Scotland, and Wales, France, Belgium, and Spain, to be convinced that this Manure warrants especial and immediate attention. They prove that it gave most wonderful results last year on every soil and crop, far surpassing the expectations of the purchasers, the dampness of this climate and the coldness of the soil peculiarly favouring its action on the vegetation.
No one reading the Company's pamphlet can doubt its being by far the cheapest of all manures. In fair comparative trials on every kind of soil and crop with guano, dung, and other long recognised fertilisers, it will be seen the "Economical" was superior; that it proved most valuable for fruit trees, shrubs, and garden purposes, and produced the most astonishing effects upon manure heaps, applied in solution, decomposing in 15 days all vegetable matter, peat included; and that it is a perfect deodoriser for liquid manure, besides enhancing its fertilising properties.
It is the result of many years' labour of an eminent Foreign Agriculturist, the Director of the Government Schools of Agriculture in his own country, and of high reputation as a chemist. It is patented, and is one of the most useful and greatest discoveries of the day.
Price 12*s.* per cwt., packages included, and delivered free on rail or wharf in London.
The Company's pamphlet containing the Testimonials, directions for use, and all particulars, also samples, to be had at the Offices, 10, Mark Lane, London, or sent on applying to
BENJAMIN COVENEY, Manager.
Good Agents wanted. An allowance to the Trade.

CHAFF-CUTTERS, of the best workmanship, 25*s.*; Two-Knifed Chaff Engines, from 63*s.*; Mills for Bruising Oats and Beans, from 45*s.*
WILLIAM DRAY AND CO., Agricultural Implement Manufacturers, Swan Lane, Upper Thames Street, City.

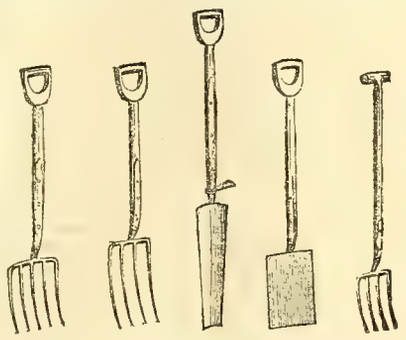
GIDNEY'S PRUSSIAN HOES.—Gardeners and Amateurs are informed that this useful Tool is now becoming a general favourite in the garden, and only needs a trial to be appreciated. Price 1*s.* 6*d.* handled. To be had of every Ironmonger and Seedsman. Manufactured only by GIDNEY & SON, East Dereham, Norfolk.

BUDDING'S LAWN-MOWING MACHINES, with Registered Improvements.
MAPPLEBECK & LOWE, MACHINISTS & MANUFACTURERS, Birmingham.

BUDDING'S LAWN MOWERS, with SAMUELSON'S registered improvements, *lightening the draught fully one-half*, and enabling an unskilled labourer to make neat work with it; free from liability to choke, or get out of order May be had of all ironmongers in town or country, or from the Works, Banbury; delivered free in a packing case to any station on the North-Western and Great Western Railways. Testimonials forwarded on application.—Britannia Works, Banbury.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

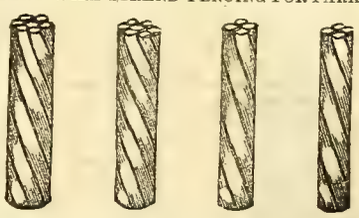


MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

HALL'S GARDEN NETTING, the best protection against Frosts, Storms, or Scorching Heat.

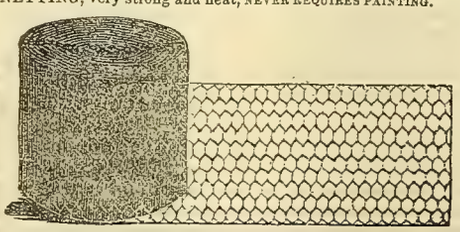
TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, 17, Smithfield Bars, City, and Old Kent Road, Southwark, where may be seen erected Emigrant Tents in great varieties, on their latest improved principles, and also at Brunswick Street, Poplar, near the East India Export Dock.

H. J. MORTON AND Co., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.
PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.
IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

H. J. MORTON AND Co., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4'*d.*, 6*d.*, and 8½*d.* per yard.
24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.
GALVANISED IRON SPOUTING, for Dwellings, Cottages Farm Buildings, &c., NEVER REQUIRES PAINTING.
Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

FRUIT TREES, POULTRY, RABBIT, SHEEP, and CAT FENCING.—Worsted Netting to protect the Bloom of Peach, Nectarine, and other Trees, Flower, or Seed Beds, from Frost, Blight, and Birds, 2 yards wide, 5*d.* per yard. NEW TWINE NETTING (Tanned if required), 1 yard wide, 1½*d.* per yard; 2 yards wide, 3*d.* per yard; 4 yards wide, 6*d.* per yard; Half-inch Mesh ditto, 2 yards wide, 6*d.* per yard. TANNED NETTING, 2 or 3 yards wide, 1½*d.* per yard; 4 or 6 yards wide, 3*d.* per yard; or 5*s.* per 100 yards, 1 yard; 10*s.* per 100 yards, 2 yards; and 20*s.* per 100 yards, 4 yards wide. ELASTIC HEXAGON GARDEN NET, or Scrim Canvas, 4½*d.* per square yard. COCOA NUT FIBRE, or Hemp Sheepfolding Net, of superior quality, 4 feet high, 4*d.* to 6*d.* per yard. Rabbit Net, 4 feet wide, 1½*d.* per yard; 6 feet wide, 2½*d.* per yard; 8 feet wide, 3*d.* per yard. Each Edge Corded, ½*d.* per yard extra, suitable for Poultry Fencing. Square Mesh Cricketing Net, fix its full width and length, made of stout cord, 3*d.* to 4*d.* per square yard; this is the best article made for fencing, against fowls, cats, &c., at W. CULLINGFORD'S. Orders by post with Post-office order or town reference, punctually attended to. The Trade supplied. Fishing Nets of all kinds in stock. Nets made to order. Tents, Marquees, Rick Cloths, Tarpaulin, Lines, Rope, Twine, &c., made to order.—1, Edmund-terrace, Ball's Pond Road, Islington, London.

LAND DRAINAGE.

MR. BAILEY DENTON'S TABLES OF COST, &c., price 1*s.* 4*d.* Sold by METCHIM, Parliament Street.
MR. BAILEY DENTON'S WORKMAN'S A LEVEL, price 1*l.* 10*s.* Sold by JONES & Co., High Holborn, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

BAILY'S ROUP AND CONDITION PILLS FOR POULTRY.—This remedy has been extensively tried with uniform success, and is offered to amateurs and the public with the greatest confidence. It will effectually overcome that disease which has hitherto been the bane of the poultry-yard, and destroy that apprehension known to all poultry keepers, when a favourite and valuable fowl is seen to droop. It is inestimable for poultry returning from exhibitions, and greatly facilitates moulting.—Sold, with full instructions for use, in boxes containing 50 pills, by JOHN BAILY, 113, Mount Street, Grosvenor Square, price 3*s.* per box, or by post 3*s.* 4*d.* "Fowls, by Baily," the most useful and plainest treatise of the day; price 2*s.*, by post 2*s.* 6*d.*
Baily's Registered Fountains, universally adopted and approved. Drawings and particulars, by post, on application.—113, Mount Street, Grosvenor Square.

AGRICULTURAL SEEDS.

To the Trade.

BASS AND BROWN can at present supply fine stocks of the following at the lowest wholesale prices.
MANGOLD WURZELS—Long Red and Long Yellow.
" Red Globe and Yellow Globe.
CARROT—Large White Belgian.
" Long Red Altringham.
Fine ITALIAN RYE-GRASS and PERENNIAL RYE-GRASS; COCKS-FOOT, MEADOW FESCUE, SWEET VERNAL, and a few others of the leading kinds of Grasses.
TURNIPS—A few of the leading kinds.
The New Agricultural GREY PEA, Bishop's last and best, a few bushels left. Also most other Agricultural Seeds. Prices to the Trade on application.
Seed Establishment, Sudbury, Suffolk.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.
PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &c.
Chemistry—J. A. C. Voelcker, Ph D., F.C.S.
Geology, Zoology, and Botany—James Buckman, F.G.S, F.C.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.
Assistant to Chemical Professor—A. Williams, M.R.C.S.
Students are admitted after the Summer and Winter Vacations, also in April and October. The annual fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelve-month—though a longer course is recommended. There is a department for general as well as for agricultural purposes.
Prospectuses and information can be had on application to the Principal.
The GUIDE TO THE ROYAL AGRICULTURAL COLLEGE FARM may be obtained of HAMILTON, ADAMS, & Co., Paternoster Row, London; and EDWIN BAILY, Cirencester. Price 1*s.*

REAPING MACHINE COMPETITION AT STIRLING. The STIRLING GENERAL AGRICULTURAL ASSOCIATION hereby offer the following PREMIUMS to be competed for during next harvest:—
1st, For the most approved Reaping Machine, of any price, 20*l.*;
2d, For the most approved Machine, not exceeding 25 guineas in price, 20*l.*
Should the judges fix on a Machine of 25 guineas, or under, to be the best on the field, it will thereby be entitled to both prizes.
The price and simplicity of construction of all the machines will be taken into consideration in awarding the Premiums, but the Society reserves the power of withholding the Premiums, if, in the opinion of the Judges, the Machines are not of sufficient merit.
Intending competitors will require to enter with Mr. Hutton, their Secretary, at Stirling, not later than the 20th of July next, when they will have due notice of the time and place of competition forwarded to them.
Intending competitors must forward with their notice of entry the sum of 2*l.* sterling, to be returned on the morning of trial to those who appear on the field of competition with their Machines.
The Machines are to be tried on all kinds of crop, and upon both Dryfield and Kerse Lands, if required. The trials to be continued until the Judges and Committee appointed by the Association are satisfied.
Machine-makers entering Machines are to state what price they will furnish such machines as they compete with to members of the Association, and Farmers entering are to state the price they paid for those they compete with. By order of the committee. WM. HUTTON, } Joint.
Stirling, March 17, 1854. WM. FORRESTER, } Secs.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—PRIZE SHEETS for the LINCOLN MEETING may be had on application to the SECRETARY of the Society, No. 12, Hanover Square, London.

NOTICE.

WEST KENT POULTRY SHOW.—At a Special Meeting held at the Committee Room, Lion Inn, Farningham, on Wednesday last, it was unanimously resolved to hold the West Kent Poultry and Flower Show on THURSDAY and FRIDAY, the 1st and 2d of JUNE.
Further particulars will appear in future advertisements.

The Agricultural Gazette.

SATURDAY, APRIL 1, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS

MONDAY,	April 3	—Central Farmers' Club.
WEDNESDAY,	— 5	—Agricultural Society of England.
THURSDAY,	— 6	—Agricultural Imp. Society of Ireland.

EVER since the days of "the first keeper of sheep" and "the first tiller of the ground," agriculture has included three main divisions—three steps or stages in the development of the raw material of all her manufactures. The first is that from which the progress starts. The student standing on it has the mineral world before him in its various forms of rock, soil, water, air. The second—one step higher in the progress of development—presents the results of vegetable life as it acts upon, and by means of, the materials and the forces furnished by the first. The third includes those portions of the animal kingdom in which the farmer is interested—herbivorous animals and their products, in and upon whose bodies the results gathered upon the second stage are manufactured or transmuted into the still

more highly developed products of the third and highest stage of all.

If, besides looking upon the mere products to be gathered on these several platforms, the student shall direct his attention to the processes exhibited on each, by which the several results are elaborated, he will notice, as belonging to each, the various artificial methods and facilities which have been introduced in order to accelerate the natural process of development, and he will also notice the various natural obstacles which have to be either conquered or submitted to. On the first stage he will observe the gradual work of disintegration and solution, by which the original impracticability of the rock is overcome, and coarse material is reduced to the state in which plants can feed on it; and while, on the one hand, he will see how, by the operations of cultivation and draining, these processes have been accelerated, he will also notice how artificial methods have been contrived for overcoming special obstacles presented to them by the impervious character of some soils, and the deficiencies of others. On the second stage, he will find the natural processes of vegetable growth accelerated by cultivation and attention to the plant during the course of it, and the natural products of vegetable growth increased both in quantity and quality, by attention to the breeding and selection of improved seed. Here he will also see how the obstacles to this growth have been met and partly conquered—how parasites, directly robbing cultivated plants, have in some cases been destroyed — and how weeds, indirectly robbing them, have continually to be fought against.

Let him now take his stand on the highest stage of all, and he will here, too, see how much both the processes and the results of unassisted Nature have been improved—how the food gathered as the result of natural growth, slowly feeding animals in an unimproved condition, has been replaced by food artificially prepared and administered to well-bred stock, yielding a result, whether in meat or fat or wool (confining ourselves to British agriculture), manifold the natural amount. And he will also see the operation of those obstacles to agriculture presented by all animal pests which prey directly upon animals, or indirectly on them through their food.

All this we have said the student *sees*: it would certainly be very greatly to his advantage if he could. Unfortunately, he can but read and hear about it all, and supply the missing illustrations of his studies by imagination. This inability, however, is not only felt to be an omission in agricultural education, it is felt to be a defect fatal to the perfect efficiency of such an education; and, accordingly, those intending to be farmers take up their residence upon a farm, where they *may* see so much of all we have described as is presented to them on the particular 1000-acre piece on which they may be placed.

The importance of actually *seeing* what one studies, is recognised by all practical men who insist on an agricultural education in the field; and it is equally felt by all lecturers, chamber teachers, and professors, as is shown by their anxiety to enlarge and fill the museums attached to their respective schools and colleges. Almost the only professional education which the former have enjoyed may have been received in this way through the eye; and even when in conversation, or by books, they may have added to what their field experience had taught them, yet the indistinctness and the fugitiveness of information so obtained has only served to confirm their judgment of the superiority of this field experience as the true agricultural instructor. And lecturers and professors will agree with them in this; they know by experience the imperfections of mere language as a vehicle of all the truth one would convey—and they also know how much more firmly truth is lodged, when the subject is before the eye as well as ear.

It is in this way that our great national museums and repositories are true educational establishments. In Jermyn Street we have a collection of many things, and expect to have a collection of everything, connected with the first platform alluded to above. The museum of economic geology refers, of course, to other arts besides (and, indeed, to other arts *rather than*) that of the farmer, but the *agricultural* student will find plenty to instruct him in it. Rocks—the material in its origin, and soils—this same material in its disintegrated condition, out of which every product of his art arises, are, or will be, represented fully; and when the scheme of the institution shall have been fully developed, every substance, process, and result in the mineral kingdom, in its agricultural as well as every other relation, will be perfectly illustrated. At Kew, again, we have, in ideal at any rate, a full representation of the second platform already named. A museum of plants, not confined indeed, nor even in a remarkable degree devoted, to those portions of the vegetable world in which the British farmer is particularly interested, but one in which every intelligent agricultural student may justly take a careful studious interest nevertheless. And when it too shall have had full scope given to its original purpose and intention, we presume that it will be a perfect illustration and museum of everything in the vegetable world; of everything that can interest the farmer as well as the gardener.

As to the third and highest platform on which the agriculturist can stand, and the museum of animal processes, products, and results which will adequately represent it, we have simply to say that *as yet there is no such thing*. And this is the point at which our remarks must at present terminate. We are happy to say that the deficiency is to be supplied, and that the steps which will ultimately lead to its establishment have been planned, and are being taken by intelligent and energetic men.

Whether the analogy furnished by the mineral and the vegetable museums does not reasonably lead us to expect at least an equal usefulness in a museum of animal products—what the particular subjects of an agricultural character may be which such a museum should illustrate—and whether farmers may not properly be called upon to lend a hand, in order that that particular share in such an establishment which shall represent their interests may be completely furnished with instances and illustrations—all these are subjects which we commend to the attention of our correspondents.

In Howitt's pleasant tale of the "Honest Dutchman," a thriving population is represented as having been in olden times much straitened for room; and upon the exhortation of one Van Manslaughter that they should march through the German forests, conquer cities and country, and "get great glory," up rose one Mynheer Kinderman, saying "let us take no man's goods, and let us do no murder; for behold we can *invade the sea!*" Then they began with mighty embankments to shut out the boisterous ocean from oozy shoals and sands; and thus in sucessive ages has been created the wonderful country of Holland. Dyking and draining have become the habit of the people—nay, even their national passion; so that —as in France, the children play at war; and in slave States at flogging—the Dutch boys and girls will build mimic walls of sand at the sea-side, encompassing themselves with glee against the rippling tide. By engineering works of vast magnitude the downs of sand have been connected into a continuous barrier along the coast; the many islands of rich warp inclosed at the mouths of the Rhine, the Maese, and the Scheldt; and the broad alluvial plains defended from the floods of these rivers. Often does the fierce and storm-driven ocean sweep over the huge ramparts, and history tells us of 100,000 inhabitants destroyed at a time; but this undaunted and truly patriotic people continually renew the broken dykes. These are generally from 120 to 150 feet through at the base; cased externally with stone, usually from the rocks of Norway. Where exposure is great, the expense of repairs is very heavy; it was even said of a well-known dyke in Walcheren, that, had it been originally made of solid copper, the cost would have been less than it has actually been. In addition to the ocean and the impetuous rivers, the numerous great inland lakes or meers, and the still more formidable salt zees, have to be banked out, and occupy the enterprise of drainers in pumping them dry, as we have just done with our own Whittlesea Mere. Many of these shallow lakes were baled out by windmills in the 16th and 17th centuries; innumerable smaller plots of low ground, or bogs from which peat had been dug for fuel, were drained in the same manner; and in process of time, a large proportion of the surface of the country lying below low-water mark in the sea, has been placed under the keeping of wind-mills, which now amount in number to many thousands. The draining of a plas (lake) or marsh is conducted in two different ways. Certain individuals, having obtained from the Government, or purchased from private parties, the necessary concession or authority, form themselves into a company. They fence the lake round with a double bank and a ring canal, erect mills, make the land dry, and then divide it among themselves, or sell it to others. But when the undertaking is large, and the profit doubtful, the work is undertaken by the Government; the land is dyked and laid dry at the public expense, and is then sold, the purchasers being bound to maintain the dykes and pumps at the common cost. In nearly all cases of "poldering," as the operation is called, the new land is exempt from taxes for the first 20 years, and, in special instances, other privileges are granted. Six, 10, or 13 feet, are depths of water which have been thus removed from off the now cultivated ground; and then the mills have perpetually to effect the drainage by lifting the water 15 to 25 feet, at a permanent annual expense of 5*s.* or 6*s.* per acre. The great Meer of Haarlem, 60,000 acres in extent, has been now drained by three monster steam-engines, which, in less than a year and a half, have pumped out the water, amounting to a thousand million tons, at a total cost of 150,000*l.*, which would have required 114 windmills, working for four years, at an expense of more than 300,000*l.* The future annual charge of maintenance will be little more than 2*s.* per acre.

It is to be observed that the general superintendence, supervision, or entire management of all the dykes, canals, and drainage, has, from the earliest times, been more or less a care of the Government for the time being. Long before the period of the Spanish dominion, the provincial dukes and governors were accustomed to extend and strengthen the dykes. In the Spanish times, the general oversight of every extensive local drainage was in the hands of the crown; and the appointment of bailiffs, dykgraafs, &c., to each, was (as we might expect) a valuable part of the patronage of the governor or viceroy of the Netherlands. Dugdale records that the Governor of Friesland, under Philip II., perfected a famous sea-bank, compelling the people, "of themselves averse and slow to so public a work, to come in, man by man, to raise this strong bank, as if it had been to quench a fire." The first polders were comparatively small inclosures; manor after manor being secured, and gradually united into large districts, superintended by separate "heemraads," or inspectors, and single boards of management. The functions of these local boards are at present confined to the application of the cheapest and most efficient methods of preserving the canals and dykes, and of maintaining their polders in the most profitable condition. But the execution of the larger enterprises is undertaken by the Government, who afterwards dispose of them to private individuals; and the special supervision of the sea-walls and great river dykes, and of all canals and sluices, in so far as they concern the general good, continues to be in the hands of the Government and the States-General. For this important national service, a special department of civil engineers has been created—the Water-staat, Water-staff, Etat d'eau. They receive special instruction in the new college at Delft, from which they are transferred to various parts of the country, and are made responsible for the condition of the works placed under their care. All national works they both advise upon and execute; concerning the state and efficiency of private works, they only advise; it is the right of the proprietors to administer.

Two centuries ago, the Dutchmen were in request as agricultural improvers in almost every part of Europe; and in England, we know that, besides the various plants, implements, &c., which they introduced to us, we have the results of their active labours in draining our fens and inclosing our marshes, as in the Great Bedford level; in the Lincolnshire fens; in the flats upon the Trent, Ouse, and Humber; in Foulness and Wallasea Islands upon the Essex coast. Some persons are of opinion that we should again profit by the experience of our semi-amphibious neighbours, in improving our own river drainage. Not exactly by sending over for a company of their engineers, but by copying their management; placing all our arterial streams under the supervision of a competent central authority, under control of the Government; and, where private or local interest has failed in remedying and preventing the disasters of floods, making it a duty of Government to execute the necessary works for the public good, in spite of local feeling as to the contrary. The information given above will assist our readers in forming their judgment of the proposal; which, though excellent enough in Holland, may be viewed with some jealousy in our own country. *I. A. C.*

BEAN STRAW FOR CATTLE FEEDING.

On referring to my statements of cattle feeding, in the *Agricultural Gazette*, of December 24th, 1853, it will be observed that I used steamed Bean straw as a substitute for Turnips partially through March, and wholly in April and May, with success. The eight heifers so treated, which in the month of February were in ordinary store condition, and the cost of which up to that time would be about 9*l.* to 10*l.* each, were sold at the close of June for 16*l.* 10*s.* each, being 6½*d.* per lb., the then top price of the market.

Up to 1852 I had used my Bean straw in a raw state, together with other more palatable material; it was, however, only imperfectly consumed, and I had not observed any particular results from it.

My Bean crop of 1853, being unusually strong in the straw, I had difficulty in inducing my cattle to eat even a small quantity. I therefore had recourse to steaming it, and procured for this purpose an inexpensive

temporary steamer of tin, with perforated holes made to fit a large pan used for brewing and other domestic purposes. The favourable effect of the steaming process was at once apparent. The Bean straw was changed from a brittle dry material into a soft pulpy one, and emitted an odour not unlike that of spent grains. The cattle showed a relish for it, and instead of requiring more palatable material as a condiment, it became the incentive, and I have as yet found no material which serves so well as an inducement to the consumption of other straw, as an admixture of steamed Bean straw.

For the present season I have procured a proper steaming apparatus, and mix before steaming one-third of Bean straw, one-third of Oat straw, and one-third of shells of Oats, to which is added, also before steaming, 4 lbs. of Rape-cake, and 3 lbs. of bran for each per day; of this, which is given *ad libitum*, they consume more than 20 lbs. each, some more and some less, or when moistened by the steam, from 50 lbs. to 60 lbs. per day; in addition to this, Turnips in limited quantity, some of them getting about 50 lbs., and others only 30 lbs. each per day. After each feed of steamed food and Turnips, given three times a day, they are supplied with fresh chopped Oat straw, of which they eat 4 lbs. to 6 lbs. each. On this fare my cattle are now gaining at the rate of 18 lbs. to 20 lbs. each per week, being the greatest average gain I have as yet effected, since I commenced the practice of weighing.

It will be observed that the materials used have hitherto been comparatively little noticed for feeding. Chemistry assigns to Rape-cake and bran a much higher value than they have yet obtained in practice; of Bean straw, I could find no analysis. I therefore sent to Professor Way a sample of that I am now using—the produce of 1853, which I give :—

Moisture	14.47
Mineral ingredients	9.45
Albuminous matter	16.38
Oil	2.28
Woody Fibre	25.84
Starch, Gum, &c.	31.63
	100.00
Nitrogen	2.58 per cent.

February, 1854. J. T. WAY.

This Bean straw, as compared with an analysis of meadow hay, shows a double per centage of albuminous matter, a somewhat less proportion of gum, starch, &c., being 40 in the hay, to 31.63 in the Bean straw. Of woody fibre, with ash or mineral matter, the proportions will be nearly the same.

The Bean crop of 1852 was cut in September, on what would generally be thought the short side of ripeness, retaining a considerable portion of the foliage, the weather was favourable, and it was stacked without rain; the yield of Beans was fully 48 bushels to the acre, of good quality, and weighed 67 lbs. per bushel. The crop of 1853 was sown early in March, but was not ready for cutting till October; the yield of straw was abundant, that of Beans was at the time of cutting thought quite equal to that of 1852. Before carrying to the stack it was exposed to some weeks of wet weather, and when carried was not in a satisfactory condition; on taking down, the Beans were much damaged, and the straw partially so; the sample for analysis was taken promiscuously from a quantity of chopped straw and leaves; the sheaves selected for the purpose were in fair condition. It will be borne in mind that this sample was from the produce of 1853. Both crops were after Turnips, the land being clean and in good heart.

I have been thus particular in describing the state of these crops, from a persuasion that hitherto straw has not obtained that attention to which it is entitled as a feeding material. I may add, that for my own consumption, I much prefer risking a little of the plumpness of the grains of Oats or Beans, by cutting them on the short side of ripeness, and preserving some of the virtue in the straw, to allowing the crop to ripen fully, in which state the straw acquires too great a proportion of woody fibre. I am by no means sure that a step further in the same direction might not be attended with advantage.

This practice of feeding was begun in December; it was not till towards the close of February that I obtained the analysis of Bean straw, which enabled me to examine the composition of the food. It appears the most correct mode of estimating the comparative properties of food to consider it as dry substance, omitting the moisture, or water, and retaining the woody fibre. It is shown in the consumption of Turnips, of which cattle will eat 150 to 200 lbs. a day, that water does not satiate, whilst of hay and straw which contain a great proportion of woody fibre, they are satisfied with less than 30 lbs., with 60 to 70 lbs. of water given separately. Taking my data from approved authorities, I find the different materials used to contain :—

	Turnips.	Bean Straw.	Oat Straw.	Bran.	Rape-cake.
Protein or albumen ...	15	19	4	16	32
Oil	2	2.75	40	6.35	12
Sugar, gum, starch, &c.	71	37	...	43.65	39.70
Fibre and ash	12	41.25	56	34	16.30
	100	100	100	100	100

The analyses of Oat straw differ considerably, from 33 to 98 per cent. of nitrogen; its quality will be influenced by the nature and condition of the soil, but still more so by the state of ripeness when cut; I have estimated mine at .63 of nitrogen and .40 gum protein, &c. In this neighbourhood we use our Oat straw for fodder, and find it answer equally well as hay when combined with Turnips either for feeding or dairy purposes; we attribute this to its correcting the laxative tendency of the Turnips—a quality which I think is not sufficiently attended to—and not to its being equally nutritive; indeed, we find our cattle thrive and do well on hay alone, whilst on straw alone they exist but do not thrive. In accordance with the contents of the foregoing Table of materials of food, I have computed the daily consumption of my animals under treatment, and give the result.

	Lbs. per day.	Protein.	Oil, starch &c.
		lbs.	lbs.
Bean straw	4	76	1.60
Oat straw, shells of Oats, and dry straw ...	12	48	4.80
Bran	3	48	1.50
Rape-cake	4	1.28	2.00
	23	3.00	9.90
Deduct for moisture in straw, &c.	2	33	1.10
Swede Turnips average 40 lbs. per day; being stored in autumn, I allow 85 per cent. for moisture	21	2.67	8.80
	6	90	4.38
	27	3.57	13.18
			3.57
Consumption per day of elements of nutrition and respiration			16 75

The comparison with feeding on Turnips, say 160 lbs. per day, with a little straw—

	Dry matter.	Protein.	Oil, &c.
Turnips	16	2.40	11.68
Straw	5½	22	2.16
	21½	2.62	13.74
			2.62
Per day for nutrition and respiration			16 46

Shows a less per centage in my food of protein compounds, and also in oil, starch, &c.; yet, by inducing them to eat a greater quantity of solid matter, I obtain a greater amount of the former, and a nearly similar amount of the latter.

There is doubtless some standard of food combining with bulk, in due proportion, elements of nutrition and respiration; it will probably admit of some modification in a lengthened course of feeding, the tendency being more to fat in the advanced stage; if we can ascertain this, or an approximate to it, we may use highly nitrogenous or oily food to compensate for their deficiency in straw or other material; this I look upon as the proper office of such food.

The tendency of my experience as a feeder is to strengthen my reliance on the chemical composition of food, and I look to the analysis of an able chemist almost with greater interest than to the many feeding experiments which are yearly published. *Y., March* 18.

Home Correspondence.

On Feeding Mountain Sheep.—In the *Agricultural Gazette* of March 18, there appears in the review of the Bath and West of England Society's Journal, a full-length report of an experiment made by Mr. G. W. Fowler, of Prince Hall, Dartmoor, on feeding mountain sheep. Eleven hoggets were selected for the trial, and they were sold in April, 1853, at 7½*d.* per lb.; net money average, 2*l.* 3*s.* 10½*d.* Mr. Fowler has once before in the *Gazette* brought this experiment before its readers, and he now winds up his report with a sort of challenge. "Query: Was the average increase of field-fed sheep last winter 1 lb. per week? I greatly doubt it." I cannot but come to the conclusion that there must be something extraordinary about it, and hope therefore we may have the benefit of seeing it particularised, as some one may doubtless then be in a position to answer the challenge. We have given to us the value of the hogget when killed by the butcher, and its keep from Dec. 4; but previous to that period nothing is said. I would therefore ask Mr. Fowler of what breed the ram was? what it cost him? how many seasons he has had him? and the number of his produce yearly? This will place me in a position to calculate the first cost of the lambs; then I would trouble Mr. Fowler with another question,—Were the hoggets ever removed from the mountains into a more genial country prior to Dec. 4? I do not despair of Mr. Fowler's challenge being taken up by some breeder of mountain sheep; for when he considers the 11 selected hoggets sold at 7½*d.* per lb., and that they were consequently only 17½ lbs. per qr., it is not much to be frightened at. *Devon.*

The Snow-storm of Jan. 2 to 5, 1854.—I accept with the greatest pleasure the challenge of your correspondent "R." to show that this was rotatory and progressive, as suggested by me in your Number of the 11th March, and that it travelled up the British Channel, over Ushant, Kent, and Heligoland, or in a line across that country. Some weeks, however, must necessarily elapse before I shall be able to collect the requisite information from some of the stations, such as Scilly and Heligoland, with which at this time of year communication is not very frequent or very easy. In the meantime, however, in reference to "R.'s" remark that "he has never been able to trace a single storm which could be explained on such a supposition" (*i. e.*, the rotatory theory), am I taking too great a liberty in asking you to reprint the following extract from a local journal? It was drawn up by me for the purpose of putting an opinion on record, and by a somewhat curious coincidence, at the very time I was preparing a diagram to illustrate it, "R.'s" communication was sent to me. I hope by next week to have this diagram ready for your acceptance.

To the Editor of the Dorset County Chronicle and Somersetshire Gazette.

October 5, 1853.

Mr. Editor,—Having had reason to believe that the violent wind which raged in the south of England on the 26th and 27th August last, was a rotatory storm, I made application to the Boards of Light-houses for England and Scotland to favour me with copies of their reports. I have now the pleasure of presenting to the public through your columns an abstract of the results. From the high temperature of the air and the great amount of rain, my opinion at the time was that this storm came from the southward and westward, probably passing between England and Ireland; and from the length of time the storm lasted that it must have crossed this island in an easterly or north-easterly direction; which I apprehend now to have been the case, and that it travelled up the Solway Firth and along the Cheviots towards Norway. At St. Bees on the coast of Cumberland the wind, which during the forenoon of the 26th had been strong at SSE. and S., with squalls and rain, fell light in the afternoon and shifted to WNW. and NW., with blue sky until the barometer began to rise, when rain set in again, which would indicate that the storm's eye must have passed over that locality.—I am, Sir, yours obediently, F. P. B. Martin.

The above letter arose out of a circumstance that excited much interest at the time. The new steam-ship Bengal left Southampton for India on the 25th August, and her life-boat having been washed ashore near Portland before the lapse of many hours, some anxiety was momentarily entertained upon her account, as it was probable that her course had led her into the vortex of the hurricane; and, in my own private mind, I thought it not impossible that our list of naval casualties would have to record another catastrophe similar to that of the ill-starred President, which, though in a far-distant quarter, encountered her fate under precisely similar circumstances, viz., putting to sea in the teeth of an approaching hurricane. My principle is, that, with an electric telegraph over the whole extent of these islands, no vessel need go to sea in the certainty of encountering such weather. Nothing is gained by so doing. She remains stationary at the best. The Bengal, with her immense powers, made but 34 miles in 24 hours. Mind me, I do not blame anybody; I only say that the practice of sending ships (not under contract) to sea at such a time is one more honoured in the breach than in the observance, especially now that science has made such rapid strides since the days of the President. Nevertheless, the Bengal did put to sea; she encountered this very bad weather; from causes with which I need not trouble you, her commander was prevented from communicating with Lloyd's until his arrival in India, and in the meantime I drew up and published the foregoing letter. How far my meteorological anticipations were verified, your readers will shortly be able to judge. *F. P. B. M.*

Disease in Sheep and Lambs, and on Draining.—In reply to the observations of your correspondent "C. B." respecting his loss of lambs, the cause is apparent from the purging of the animal. Sheep, feeding upon Turnips, should be put back at night upon the previous fold and remain there until 10 o'clock the next morning, and during that time be supplied with dry food, with a few bruised Oats, malt-coombs, or the sifting of dried split Peas. The Turnips are injured by the sprouting, and the sprouts being eaten greedily by both sheep and lambs, disorder the bowels. That the tops of the Turnips are the main cause is quite certain; for, since the tops have been cleared from my Turnips (from the demand of the London market for vegetables), we have not lost a lamb, but previously we frequently lost both sheep and lambs. Wether sheep, feeding upon common white Turnips, fatten rapidly if hard grey Peas are given; but if fed upon Rape, and Peas are added, they die rapidly from purging and griping of the bowels, with general inflammation. Whenever sheep and lambs are affected as described by your correspondent, it almost invariably arises from the quality of the food; and if a corrective course is substituted, a cure is easily effected. And it is always advisable when feeding on Turnips, or other succulent food, to give plenty of dry food in addition, especially if the slightest disposition to scouring is apparent either among the ewes or lambs; and bruised Oats will always be found beneficial, to the extent of a pint per day. Another correspondent alludes to the Equisetum, its roots interfering with his drains. I have known an instance of drains being entirely filled with the roots of this plant within three years; and I took from one drain a continuous band of roots upwards of 20 feet long, so closely interlaced as to resemble a large rope of cocoa-nut fibre. *R. B.*

Origin of Ammonia.—I cannot say, in answer to Mr. Prideaux's inquiry in a late Number, that I have ever made any experiment for the specific purpose of proving that ammonia is formed or developed in the decomposition of vegetable matter, containing an unappreciable amount of nitrogen. But the ground on which I stated that such is the case was observation of the fact under casual or accidental circumstances, which I regarded at the time as confirming the view I had adopted of the

origin of ammonia. A small Grass plat had been mown, consisting entirely of blades of Grass or herbage, without any intermixture of flower or seed stems. I mention this, as I consider it presented in this state a specimen of simple vegetable substance, in which there could be little, if any, nitrogen present. The Grass was thrown into a heap, and left in that state in wet weather for some days, when it was removed under cover; a few days afterwards, when the heap was opened up, it was found heated inside, and decomposition had proceeded to some extent, and the odour of ammonia was distinctly perceptible in the fermenting mass. Perhaps this account may not be altogether satisfactory to Mr. Prideaux; but if, as I conceive was the case, there was little or no nitrogen present in the Grass mowings, from what could the ammonia have been formed, except from the hydrogen of the decomposing vegetable matter, uniting with the nitrogen of the atmosphere? But, indeed, in my view, it would scarcely alter the complexion of the question, if it were admitted or proved that the vegetable matter contained any amount of nitrogen; for, unless there had been hydrogen present in it, it appears to me that no ammonia could have been formed, whatever the amount of nitrogen present. For the only other supposable source than the vegetable matter itself, from which hydrogen could be obtained, is in the decomposition of water; but what proof is there that water either is or can be decomposed under the circumstances and conditions of the case, viz., the resolution into its elements of inert vegetable matter, and their re-combination with other elements, both of which are present in the atmosphere in unlimited quantity, and their operative influence in the process seen in the fact, that if the atmosphere be excluded, decomposition is stayed? Mr. P. observes that non-nitrogenous matters ferment acid, meaning, I presume, that in the decomposition of vegetable matter, the carbon and hydrogen unite with oxygen, and form respectively carbonic acid and water. The first is an acknowledged fact: but, with respect to the other—the uniting of the hydrogen with oxygen and forming water—will Mr. P. permit me to ask him whether this be even possible in the given circumstances? I have been accustomed to regard the chemical union of oxygen and hydrogen, constituting water, as a thing not effected without the intervention of powerful electrical agency, or some equivalent force. If you mix these gases in the proportions that constitute water, they refuse to unite until the electric spark is passed through them, when they are converted into water with explosive violence. Or, if you wish to make hydrogen unite with the oxygen of the atmosphere and form water, you must first ignite the hydrogen. It cannot be done on easier terms. As no such condition of flame or elevated temperature is, or can be, found in a mass of fermenting and decomposing vegetable matter, I submit that it is a physical impossibility for the hydrogen to unite with oxygen under these circumstances. What, then, becomes of the hydrogen? It does not escape into the atmosphere, for no traces of free or uncombined hydrogen are to be detected there. If it unites with nitrogen and forms ammonia, the latter can be obtained only from the atmosphere, if the full proportion be not present in the decomposing vegetable matter requisite for combining with the hydrogen in forming ammonia. *J. H. H., March* 11.

Societies.

ROYAL AGRICULTURAL SOCIETY.

Weekly Council, *March* 29.—Colonel Challoner, Trustee, in the Chair. The names of 61 candidates for election at the next meeting were announced.

Mortality among Lambs.—Professor Simonds informed the Council that he had inspected Mr. Cresswell's lambs in Leicestershire, and had made *post-mortem* examinations at the Royal Veterinary College, of some that had died there. He had been favoured by Mr. Cresswell with others, which, with an ewe, were undergoing inspection in reference to the gradual development of the disease with which it was supposed they were affected. He had made a minute examination into all the local circumstances under which this malignant disease had occurred among Mr. Cresswell's flock, and when he had completed his investigations into its nature, and the best remedies for its treatment, he would lay before the Council a complete report, embracing the whole of the details connected with the subject, which presented many novel features in reference to the disorders affecting sheep.—A letter in reference to the case of Mr. Cresswell's lambs was read from Mr. Eames, of Ashby-de-la-Zouch; and remarks on the different points connected with Prof. Simonds's inspection, were made by Colonel Challoner, Mr. Raymond Barker, Mr. Fisher Hobbs, Col. Hall, M.P., and Sir John Shelley, Bart., M.P.

Mad Dogs.—Prof. Simonds then communicated the following statement relative to the fearful increase of mad dogs, and their ravages in and about London:—

1. At the present time madness prevails among dogs to an unusual extent, particularly in the neighbourhood of London. Within the last few weeks several sheep and horses have been bitten by dogs, and have since died in a rabid state. These occurrences have taken place in the northern districts of the metropolis; and within the last few days two dogs, which gave only very slight evidences of deranged health, were brought to the Royal Veterinary College, and have since died in a perfectly rabid condition; one of these dogs having previously bitten no less, it is feared, than 40 other dogs.

2. The sheep alluded to belonged to three farmers at Hendon, and were bitten in the early part of last February; they died at the beginning of March, exhibiting all the symptoms of this horrible malady.

3. A horse also bitten at the same time died a fortnight since in Kentish town, perfectly mad.

4. This disease prevailed last year in the northern part of England, and has been gradually proceeding southwards. A farmer in Lincolnshire had last year upwards of 60 ewes bitten in one night by a single dog, all of which animals, with two or three exceptions, died within a few weeks afterwards. An unusual number of dogs are at the present time loosely wandering about the streets, apparently without owners.

Prof. Simonds then read a letter addressed to him on this subject by Mr. William Simpson, one of the Members of the Council; and Col. Challoner, Mr. Majendie, Sir John Shelley, Mr. Bullen, Prof. Way, Mr. Foley, and Mr. Wrench, favoured the meeting with their remarks, when, on the motion of Mr. Raymond Barker, seconded by Sir John Johnston, Bart., M.P., the Council agreed to the following preamble and resolution:

"Professor Simonds, the Veterinary-Inspector of the Society, having made a report to the Council, relative to the alarming increase of mad dogs in the immediate neighbourhood of the metropolis, and of the fact that several sheep and horses have been bitten and destroyed.—Resolved, that the Secretary of the Society be instructed to communicate these facts to the Right Hon. Viscount Palmerston, G.C.B., her Majesty's Principal Secretary of State for the Home Department, with the view of calling his lordship's attention to their consideration."

Oil-cake.—Mr. Fisher Hobbs called attention to the following communication, which had that day been placed in his hands:—

"We observe from the public press that your Council have been discussing the subject of oilcakes, and, as seed crushers, we are much pleased that the adulteration of Linseed cakes has been taken up by your Society, and we trust that the attention of so influential a body amongst agriculturists being directed to the question may pave the way for at least an abatement, if not to an entire suppression, of the evil, which is not only a fraud upon the buyers, but an injury to manufacturers of genuine cakes. We would, however, respectfully state that, from our own knowledge, much of the evil complained of arises from the prejudice of farmers, by their objection to cakes being hard, and which has induced many crushers to resort to adulteration, not only with nut cakes but also with bran and other mixtures to produce a soft cake, and we have known many instances in which a preference has been given to adulterated cakes over those made from genuine seed. We beg further to communicate that what is called a soft cake, to be genuine, cannot be produced from the finest description of seed, and one step towards the object sought by your Council would be by agriculturists laying aside their objections to a cake, if rather hard. There being no process that should be kept secret in the manufacture of cakes, we would suggest that crushers at all times allow to buyers free access to any part of their mills, by which means they may satisfy themselves that the cakes they are buying are free from all mixture of bran, nut cake, or other ingredient. Our own mill is open in every part and at all hours for the inspection of buyers—let this be generally acted upon, and the adulteration of Linseed cakes will cease. We sincerely trust that the evil so justly complained of may be removed."

Mr. Hobbs thought this communication most valuable. He had known soft oil-cake contain in many cases no less than 15 per cent. of water, and he thought the purchase of such an article was buying water at too dear a rate.—Col. Challoner, Prof. Way, Mr. Paine, Mr. Caird, Mr. Gower, and Prof. Simonds, offered observations on, 1, The degree to which chemical analysis could furnish more than the relative proportion of albuminous matter and oil in different oil-cakes, with a view to detecting adulteration; 2, On the value of the microscope, by the discriminative means of which it was probable that all agents used for adulterating cake might be detected; 3, On the conditions under which the feeding and keeping qualities of oil-cake were affected by its hard or soft state; and 4, On the confidence to be placed in cake purchased of established dealers of known reputation.

Manure Heaps.—Mr. Robert Austin, of 65, George Street, Manchester, informed the Council that upwards of a ton of horse-dung was produced in his stables daily, and the usual offensive odour and evaporation from it entirely prevented by sprinkling over the dung-heap, by means of an ordinary watering-can, a solution of a pound of common green copperas in a gallon of water. The value of this chemical agent in fixing ammonia and strengthening manure had long been known (Journal I., 468, 470, 475), but Mr. Austin's practical application may be considered simple, effective, and easily adopted in similar cases.

Potato Disease.—The Hon. Grantley Berkeley presented a copy of his work "On the Origin, Nature, and Cure of the Potato Disease" (dedicated to the Society), with a statement of further details connected with his system of cultivation. Dr. Malfatti transmitted from Vienna a second series of his experiments on the cure of the Potato disease. M. Lainé, of Paris, forwarded copies of his results on the same subject.

The Council ordered their usual acknowledgements for the communications then made to them, and adjourned to the 5th of April.

Highland and Agricultural, *March* 22.—Professor Lowe presided. "*The Recent Progress of Scientific Agriculture.*" Dr. Anderson, in the course of his address on this subject, after preliminary remarks, referred first to our knowledge of soils, and on this department of his subject he thus discussed the researches of Professor Way, on the absorptive power of soils:—

It has been long known to chemists that clay possesses, to a small extent, the power of absorbing and fixing ammonia; but Mr. Way has shown that all fertile soils are capable of absorbing not only that substance, but the alkalies and magnesia. Thus, if a soil be shaken up with water containing a small quantity of ammonia or any of its salts in solution, and then left to deposit, the clear fluid drawn from the surface is found to be entirely free of ammonia. This absorption, however, is confined to the ammonia, none of the acid with which it is combined being retained by the soil. Thus, if sulphate of ammonia be employed the whole of the sulphuric acid is found in the fluid combined with lime. A true chemical decomposition has here occurred, lime derived from the soil having replaced the ammonia in its compound. The extent to which the absorption of these substances takes place is small, and has, as yet, been accurately ascertained only with regard to ammonia and potash. It differs greatly according to the nature of the soil, and whether the substance is employed in the pure state or combined with acids. Thus, a loamy soil from Dorsetshire absorbed 0.3921 per cent. of ammonia; a lighter soil from Berkshire took up 0.1570, and a subsoil clay from Somerset only 0.0818. In regard to potash, the experiments published by Mr. Way refer only to a sort of pottery clay, which takes up 0.4366 per cent. from the nitrate and 1.05 from a solution of pure caustic potash. Direct experiment has shown that this absorptive power is not due to sand; and as it is found to exist in pure potter's clay, brought up from a considerable depth, Mr. Way infers that it does not depend on organic matters, but is entirely due to the clay. In a later paper he has extended his investigations, and starting from the obvious fact that the absorption could not be due to the clay as a whole, but rather to some particular substance existing in it, and possessing a high degree of absorptive power, he has inquired into the subject in this point of view, and arrived at results of much practical and scientific interest. As it was manifestly impossible to extract from the clay the supposed substances to which its absorptive power was attributed, he adopted a different mode of investigation. He first proved that felspar, albite, and the other minerals from which the clay of our soils is produced, have no absorbent effect, and then proceeded to try what could be done by the artificial formation of substances of similar nature. When silicate of soda is added to a solution of alum, a white powder is formed which is a compound of silicate of alumina and silicate of soda, and this, when treated with a salt of lime, gives a similar compound, containing lime in place of soda. When this substance is macerated with a salt of potash or ammonia, it is decomposed, and there are formed double compounds containing these substances, and nearly insoluble in water. The potash compound so formed contains 24 per cent. of potash, and that of ammonia contains about 5 per cent. These substances are so little soluble in water, that a gallon extracts from them only 2.27 grains of potash, and little more than 1 grain of ammonia. The practical inference from these facts is sufficiently obvious; suppose the soil to contain the silicate of lime and alumina, and a quantity of sulphate of ammonia to be employed as a manure, we should necessarily have produced the absorptive effect actually observed in practice: sulphate of lime would be formed, and the ammonia would pass into the sparingly soluble double silicate of alumina and ammonia, which would thus become a magazine from which that important element of our crops would be slowly liberated to the extent of a grain for every gallon of water, so as to fulfil the requirements of the plant. The solubility of these compounds is however so small, that in some instances a sufficient quantity of potash and ammonia might not be obtained by the plant, were it not that their solubility is remarkably increased by carbonic acid and common salt. Mr. Way found that a gallon of water saturated with carbonic acid gas dissolved 2.5 grains of ammonia from its compound, and a solution containing 1.97 per cent. of common salt dissolved out ammonia at the rate of 23 grains per gallon. We have thus another function which carbonic acid may possess, and in addition to that of acting as a food for the plant, it may serve as the agent by means of which an additional supply of other substances is presented to it. The fact just mentioned may also explain the effect produced by common salt, which has always been a difficulty, especially since we have seen reason to believe soda is of little importance as a food of plants. We have already alluded to the absorption of phosphoric acid, which is in no degree dependent upon these double silicates, but solely on the presence of lime in the soil, with which it forms an insoluble compound. It cannot be doubted that these observations are of much importance, and have a very important bearing on the practice of agriculture. I cannot help thinking, however, that Mr. Way carries his views too far, when he denies any absorbent influence to the organic matters of the soil, and attributes it exclusively to these double silicates. It has been distinctly proved that humus absorbs and retains ammonia and its carbonate; and though I do not know that the experiment has been tried, the humate of lime (which certainly exists in the soil) ought on chemical grounds to decompose the salts of ammonia, and form the humate of ammonia, which retains its base with great obstinacy. It must also be remembered that it has not been proved that these double silicates actually do exist in the soil, but only inferred, that because when artificially produced they absorb ammonia, they may be the cause of the same effect in the soil. Difficulties even exist in explaining how they should be formed there; but, with all this, it is manifest that the inquiry is an important contribution to our knowledge of the chemistry of the soil. But we must beware lest we carry too far the inferences to be deduced from those experiments, and I think there is rather a tendency to do so. The absorptive power of soils is a convenient phrase which I have sometimes heard used, as if sufficiently explaining facts otherwise unintelligible, although a very little consideration might have shown that they could not possibly have any connection with it.

On the next section of his subject, *Manures*, Dr. Anderson referred thus to Mr. Pusey's experiments on nitrate of soda:—

I presume all my audience are aware that by the use of no more than 42 lbs. per acre, Mr. Pusey obtained an increase of 7 bushels of Barley, or more than four times the value of the manure. I need scarcely say that the experience of many farmers in this neighbourhood has clearly established the value of nitrate of soda as a top-dressing for Grass lands; in general, however, it has been employed in larger quantity (1½ to 2 cwt. per acre), and the application of two-thirds cwt. by Mr. Main is, so far as I know, the smallest recorded except Mr. Pusey's. In a subsequent paper, on the natural law by which cubic nitre acts as a manure, Mr. Pusey enters on more difficult ground. In regard to it, I may observe in the first place, that a very curious misapprehension seems to have existed as to the views entertained by chemists regarding the source of the value of nitrate of soda, and it has been asserted that they still considered it uncertain whether that manure acted by virtue of its nitric acid or its soda. I think it right distinctly to contradict this statement. The strict retainers of the Giessen School of Chemistry may possibly still entertain such doubts, but I apprehend, that if Mr. Pusey had put the question to any agricultural chemist, he would have received for reply that it was most unequivocally due to the nitric acid, and not to the soda. It has, however, always been considered doubtful whether the nitric acid is assimilated directly by the plant or is first converted into ammonia, which we know it very readily is; that, however, is an entirely different question on which experiment has not as yet thrown the slightest gleam of light, and which will probably continue long undecided. As far as the question of the constituent on which the value of nitrate of soda depends is concerned, it must be considered as having been entirely set at rest 10 years since, by the experiments of Kuhlman, who showed that nitrate of lime produced the same effects; and the experiment with diluted nitric acid which Mr. Pusey has detailed in his last paper, though sufficiently interesting in other respects, was quite unnecessary. As the result of the experiments contained in his papers, Mr. Pusey has deduced as a natural law, that "substances strengthen vegetation, mainly by their contents of nitrogen." But in this there is nothing new; it is exactly what chemists have over and over again asserted, except that they have not gone by any means so far; and while attributing a pre-eminence to nitrogen, have not failed to point out the importance of other substances. But when we come to consider the matter in all its details, there are other points not referred to by Mr. Pusey, which deserve attention. The experiments of Kuhlman were made for the purpose of contrasting the value of nitrogen in different forms, and the substances used were sulphate and muriate of ammonia, nitrate of soda, Peruvian guano, and the gelatine of bones. The result was, that for every 100 lbs. of nitrogen contained in the manure, there was obtained an increased produce in round numbers of 3000 lbs. of hay with the salts of ammonia, of 5000 lbs. with nitrate of soda, while with Peruvian guano there

was in one case an increase of about 9500, and in another of no less than 16,000 lbs. of hay for the same quantity of nitrogen. The gelatine gave nearly the same increase as the ammonia salts. These results are still more striking when we observe the effect on the subsequent crops; for with the salts of ammonia and nitrate of soda, the effect was not only entirely exhausted on the first crops, but that immediately following was actually diminished, while with Peruvian guano and gelatine, the increase was spread over several years. Nor is there anything unintelligible in this result; guano gives to the soil much more than nitrogen, it supplies phosphoric acid and the alkalies, and hence, theoretically, ought to produce a higher effect. Such are the results of Kuhlman's experiments. They support fully Mr. Pusey's opinion as to the value of nitrate of soda, but they are totally at variance with that law which Mr. Pusey tells us we may now adopt with unhesitating certainty, namely, that substances strengthen vegetation mainly by their contents of nitrogen; for we perceive that nitrate of soda surpasses sulphate of ammonia in the ratio of 5 to 3, while if their action was merely dependent on their nitrogen, they ought to produce the same effect. Further, a quantity of guano produces in one experiment three, and in another five times the effect of sulphate of ammonia, a difference which can only be attributed to the other constituents of the guano. I have mentioned these experiments, not with the view of throwing any doubts on the advantages derived from the use of nitrate of soda, for on that point there can be no question, but rather as a caution against the too hasty adoption of that law, which Mr. Pusey says we may now assume with unhesitating certainty, and to show that there are many points regarding its use on which we still require experimental evidence. So far from supporting Mr. Pusey's law, those experiments rather point towards a view which at a monthly meeting of the society, some two or three years since, I suggested as deserving experimental inquiry, but which, much to my regret, has not yet been taken up. I believe the facts at present known tend to show that, while nitrate of soda exerts a marked influence upon the growth of the great family of graminaceous plants, it is nearly or altogether without effect upon roots and Clover, and I suggested that just as there are two classes of animals, carnivorous and herbivorous, so there might possibly be two classes of plants capable of deriving their nitrogenous constituents from different sources, one assimilating it chiefly or only from ammonia, the other possessing in addition the power of elaborating it from nitric acid. This view derives some support from the recent experiments of Wolff, which have shown that the nitrates which act powerfully upon Barley are almost without effect upon Tares. It must be understood, however, that I throw out this merely as a suggestion, to be confirmed or refuted by experiment.

We must postpone for a week Dr. Anderson's further remarks on rotations of cropping.

Society of Arts, *March* 29.—The Right Hon. the Earl of Harrowby in the chair. *A paper by Mr. Leone Levi, F.S.S., on Agricultural Statistics.*

The paper stated that the arable and garden land of the United Kingdom is about 20,000,000 of acres, and the meadows, pastures, and marshes contain 27,000,000, a surface considerably smaller than that of many other countries. The number of farmers in Great Britain actually does not exceed 300,000. We may conceive that in such an immense country as Russia, with half the land comparatively raw and unapproachable by the ice, or in such a country as the United States, now only subjected to human strength by the iron axe of the sturdy settler, it will indeed prove difficult to scan it all over to compute the number of acres sown with different crops, and the number of quarters of grain which they yield. No such difficulty ought to be experienced within the British Islands, every portion of which has been long explored, inhabited, and tested as to its capabilities to the best of human powers and ingenuity. The important object to be kept in mind is, that of all statistics agricultural statistics are intended to meet a substantial want. What is wanted is, first, how many acres of land are sown with each kind of crop; secondly, the probable yield; and this sufficiently in time to govern the markets, to check alarm, or to give a timely warning of impending wants. We know our wants, if we do not know our supplies. We know that a population of 28 millions will require 28 million quarters annually of Wheat and flour, besides what is wanted for cattle, horses, malting, and other purposes. Already our population is largely dependent on foreign Wheat. Estimating the yearly consumption of each individual at eight bushels, and taking the average yearly importation of Wheat and Wheat-flour, it seems that whilst from 1801 to 1810, the mean population of Great Britain being 11,769,725, the number of persons fed upon foreign Wheat was 600,946; from 1841 to 1850, the mean population being 19,967,876, the number dependent upon foreign Wheat and Wheat-flour was not less than 2,818,328. Of late, the importation has been uniformly large, leaving a conviction that our agricultural produce does not keep pace with the increase of our population and with their growing resources; and we are the more interested to ascertain as early as possible what is that amount of extra supplies which will be required to meet our already large want of foreign help. Of the two subjects of inquiry, how many acres of land are sown, and the probable yield, the former is more easily ascertained than the latter. In both there must necessarily be some looseness. The first would embrace the number of acres sown with Wheat, Barley, Oats, Rye, Beans, Peas, Flax, Seeds, Turnips, Potatoes; the number of acres in permanent Grass, and the number in annual Grass, &c.; the second, an estimate of the probable yield of each per acre. The returns of the number of acres under crop might be collected early in spring.

With respect to agricultural statistics, it needs be a vast national measure, co-extensive with the kingdom itself, requiring considerable and permanent machinery, such as no private energy can in any case supply, and like the census of population, the statistics of education or of crime, it behoves Government to undertake it by the best means at their command. This duty Government is about to assume, and it is all-important that all classes—the farmers, the merchants, the landholders, and the magistrates—should afford them their moral and physical co-operation. The statistics of agriculture should devolve on the statistical department of the Board of Trade; but that office would require to be expanded and reconstructed to undertake this important duty. The next statistical organisation in this country is that of the Registrar-General for births, deaths, and marriages. The other statistical organisation which Government seems disposed to adopt, is the Poor-law Board; and it is by their instrumentality that agricultural statistics have lately been obtained for the counties of Norfolk and Hampshire. With regard to Scotland, the Highland and Agricultural Society having succeeded in the statistics of three counties, they, in all probability, will be entrusted with the entire management for that part of the kingdom. It remains now to notice the objections that have been raised on the part of some of the farmers. They fear the results of such statistics, that such may be subsequently used to their disadvantage, either by imposing on them new taxes, or by the raising of the rents, or that they are intended for some political purpose. Such objections it is all important to remove by convincing the farmers of the utility of such accounts, and by showing them their bearing on the price of produce, and on the public welfare. Sir John Boileau proposes that commissioners be sent throughout the country to extend information among the farmers on the subject of agricultural statistics; and though the plan would be attended with considerable expense, it would have the effect of removing any prejudice which may still exist against such statistics, and facilitate materially the obtaining of compendious accounts from the most distant provinces. M'Culloch gives the value of the crops of the British empire at 120 millions sterling, and the value of the land in England at 128 millions. It has already appeared that the improvement of agriculture in this country has scarcely kept pace with the increase of population.

A discussion followed the reading of the paper. Mr. Sidney explained and combatted the objections of farmers, and criticised the details of the plan suggested. Mr. Caird referred in considerable detail to the agricultural and national importance of the information sought, and described his own plan for collecting it, which we hope to give next week. Lord Harrowby stated his opinion that the information on the crops for any year should be given simply relatively to the ordinary average yield of each district, for which information was required. Mr. Morton related an instance within his own experience, illustrative of the money value to the farmer of the information which correct statistics will give him. Mr. Slaney referred, among other things, to the relation in which the subject stood to the labouring class. The discussion was adjourned till next week, when we hope to report it in greater detail.

Calendar of Operations.

MARCH.

Cheshire, *March* 28.—The very favourable weather during the last month for all field operations has enabled the farmers to proceed rapidly with their spring tillage. About the latter end of February and the first week in March, the sowing of Wheat, which had been deferred from the latter end of the year, was very satisfactorily completed; immediately after Bean sowing commenced, and Oats also were sown the first week in March, on some of the best land, and they are now making their appearance above ground. The growers of early Potatoes have taken advantage of the fine weather, and put in their seed at a much earlier period than usual; but as the crop frequently suffers from frosts, there is a deal of risk in planting so early, for should the "wizle" be cut down, the growth of the young Potatoes is much retarded, consequently the crop is materially injured, and in all probability will not be ready for market any sooner than from those planted a fortnight or three weeks later. The Wheats, which have been severely cut by the frosty winds, are beginning to recover their green appearance, but it is to be feared that in many instances the slug has committed such ravages as to leave the young plants too thin on the ground; Oat and Barley sowing is in a forward state, and land intended to be laid down with seeds is in fine order for receiving them. The planting of winter Potatoes is progressing rapidly, as the experience of a few of the past years proves that in these days of Potato blight, delays are dangerous. The land intended for green crops is in a forward state of preparation, and with a continuance of favourable weather, will be in fine condition for receiving the seed. Upon the whole it has been a good season for ewes and lambs, and the Clover roots are now beginning to afford them a good bite. *N. C.*

West Sussex, *March* 27.—Since our last report we have not had much change in the weather. It has been very dry and rather cold, so that vegetation is very little advanced. On the 17th we had some fine refreshing showers, which made a great change in the appearance of the Wheat, and it was beginning to want it; but as it has been cold since, the effects of those showers are not now so perceptible, and a little rain now would be of great use to everything. The cleaning of land has been got done well, and dry weather would still be found useful for that purpose. Work is generally well advanced, as indeed it ought to be, for we have seldom had a season so favourable to its progress. Barley sowing is got forward so far, as the land is clear for it after the sheep, and it will be got in rather earlier than usual; the Turnips being not so plentiful as they generally are, and with the cold weather that we have, we may find it difficult to provide sufficiently for the stock till Grass becomes fit. But everything will come the better for being kept well back in its place. And with the month of April we may hope to have showers that will put all to rights. Our work will now be to get the Mangold Wurzel land in order for sowing about the end of next month; and though it is said, and with some reason, that if they are sown much before the end of April they will run to seed, yet I have seen them, when sown in the middle of that month, not do so, and I have seen some do it when sown in the middle of May—so that something besides the time has to do with it; and may it not, in some measure, be caused by the badly pulverised state of the soil below preventing the small fibres from spreading themselves freely?—and instead of a large bulb with small thread-like fibres collecting its food, we have a cluster of only strong roots, striking themselves where they best can in the hard soil, and spending part of their strength in nourishing a strong unsightly top. Whatever is the cause, I do not think the time of sowing at all times can account for it; and as it is a plant that grows but slowly in its first stages, it is well to have it in in good time, so as to be fit for hoeing before the annual weeds are in their full strength of growing. We shall also have employment in abundance to get the Turnip lands prepared in good time, as the last few wet seasons have left their effects upon them, but it is to be hoped that the present season will put all to rights. *G. S.*

Notices to Correspondents.

Grass: *Clericus.* You had better mix 3 cwt. of Peruvian guano with a cart-load of vegetable mould, and sow that quantity broadcast over each acre of your Grass field in wet weather *now*. It will cost you 36*s.* per acre for the guano, which is now to be had at 12*l.* per ton.

Soapers' Waste: *W Blood.* When first turned out they contain carbonate, sulphuret, and sulphite of lime. By exposure and burning, the latter becomes converted into sulphate of lime. When well burned, or exposed to the air till it becomes a white powder, it consists of sulphate and carbonate of lime. In most works the ashes are wheeled out to a large heap, which is in a constant state of internal combustion; and when well burnt the farmers fetch them away. They are valued on stiff land. You must not apply them to growing crops, nor should you sow anything immediately after their application. If, however, left for a week or two on the soil, the perfect oxygenation of their sulphur would be effected, and they then are harmless and beneficial. It is worth while giving 2*s.* a ton for them, and hauling them six or seven miles. They apply a ton per acre.

HOSE PIPING.—Great Reduction in Price.

WAITHMAN'S PATENT FLAX TUBING (1 inch to 3 inches diameter) is woven without seam, to stand immense Pressure, and much more than Leather, vulcanised Rubber, or any other Hose; and it is prepared so as to be anti-rot. The difficulty of producing this HOSE at a moderate rate has hitherto been its only drawback; but, owing to recent important patented Inventions, the cost of manufacturing it is now reduced at least 60 per cent., which advantage is offered to the Public.—London Agents, Burgess & Key, 103, Newgate Street, and 52, Little Britain, who on application will forward wholesale and retail prices.

THE GUTTA PERCHA COMPANY'S TUBING for Watering Gardens, with Roses and Union Joints Fitted.—27, City Road, London.

J. TYLOR and SON'S REGISTERED GARDEN SYRINGE.—By a simple arrangement this Syringe is rendered more effective than any portable Conservatory or Garden Pump ever offered to the public. It is equally adapted for Garden or Conservatory use, and is capable of discharging twice as much water in a given time as any other Syringe now in use. The arrangement consists in attaching a small flexible suction tube to the barrel of the Syringe, through which it is filled with water at every discharge of the previous contents. By this means the Syringe is always charged, and the pull-up stroke of the piston rendered perfectly easy, it having, indeed, no work to do, the barrel being previously full of water. Being thus made self-supplying, a great saving of labour is effected; and the necessity of stooping to fill the Syringe at every discharge being done away with, the direction of the water can be maintained for any length of time. It is perfectly cleanly in its action, as it is not possible for any water to get on the outside of the barrel, which is a well-known inconvenience attendant on the use of every other Syringe. Its construction is perfectly simple, and cannot get out of order; the ground-in ball valves and fittings used for filling all other patent Syringes being entirely superseded. Price complete, with India-rubber suction tube, with galvanised spiral inside, and covered with cotton outside, 25*s.* each. To be had of any respectable Ironmonger or Seedsman in town or country.

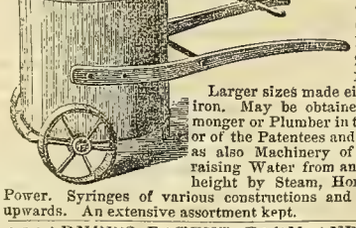
J. Tylor & Sons, Manufacturers of Horticultural Apparatus, Warwick Lane, Newgate Street, London.

JOHN WARNER AND SONS,

Crescent, Jewin Street, London.

GALVANISED IRON TUB GARDEN ENGINE,

With Warner's Registered Spreader



Is strongly recommended, for durability and low price, viz., 2*l.* 19*s.*, to hold 10 gallons.

Larger sizes made either in wood or iron. May be obtained of any Ironmonger or Plumber in town or country, or of the Patentees and Manufacturers, as also Machinery of all kinds for raising Water from any depth to any height by Steam, Horse, or Manual Power. Syringes of various constructions and sizes from 9*s.* upwards. An extensive assortment kept.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d.
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

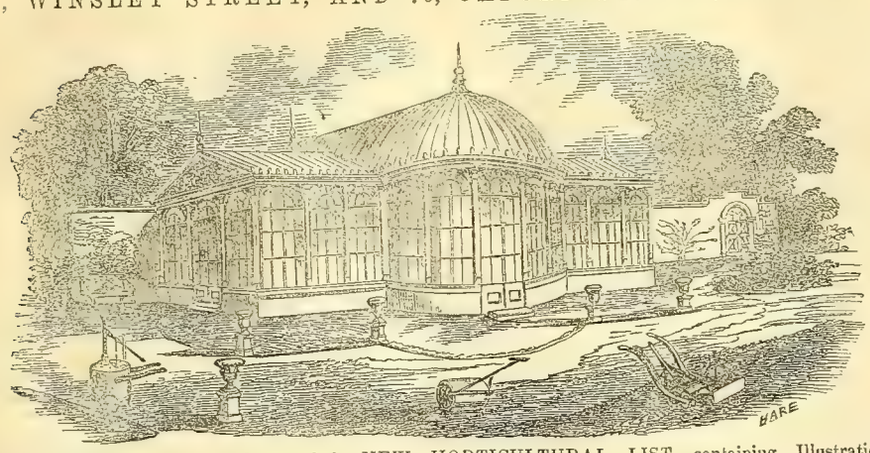
8, Crescent, Jewin Street, London.

Every description of Machinery for Raising Water; Fire Engines, &c.

An Illustrated Book sent on application post free.

COTTAM AND HALLEN,

2, WINSLEY STREET, AND 76, OXFORD STREET, LONDON.



APPLICATION is requested for their NEW HORTICULTURAL LIST, containing Illustrations, Descriptions, and Prices of

Conservatories	Mowing Machines	Hand-glass Frames	Garden Engines	Flower Sticks
Greenhouses	Fountains	Game Netting	Do. Syringes	Garden Bordering

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.

GLASS TILES AND SLATES made to any size or pattern, either in sheet or Rough Plate Glass.

Propagating Glasses, Beehive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in Glass.

PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.

GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the excise duty, reduced one-half. List of Prices and Estimates forwarded on application to

JAMES HETLEY & Co., 35, Soho Square, London.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

PATENT GLASS TUBES, Iron Coated with Glass, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Sluice Cocks, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of

FREEMAN ROE,

HYDRAULIC ENGINEER,

70, Strand, and Bridgefield, Wandsworth.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

ENCAUSTIC TILE PAVEMENTS.

MAW & CO., of Benthall Works, Broseley, Shropshire, send Post Free their PATTERN BOOK and FURNISH DESIGNS (with estimates) in this beautiful and durable production to any given plans of Churches, Entrance Halls, Passages, Conservatories, Verandahs, &c.—Specimens at 11, Aldersgate Street, London.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

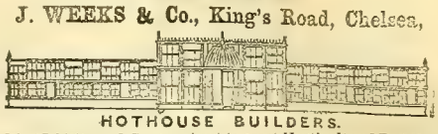
MORNING FROSTS.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1s. 6d. per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey. (Removing in May next to 112, Regent Street, London.)

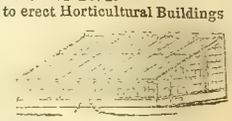
HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

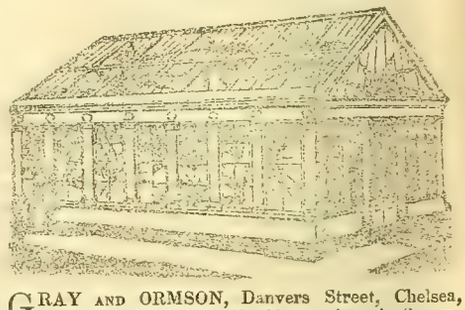
The splendid collections of Stove and Greenhouse Plant, are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1s. 3d. per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8d. per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

GREEN AND HOTHOUSES made by machinery at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Warranted of best materials: being made by steam-power, they are put together in a superior manner; one trial will prove these Buildings to be the cheapest and best made in England. 1¼ in. Greenhouse lights at 3½d. per foot; 2 in. at 4½d. per foot. Lists of Prices by enclosing two postage stamps.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

TELESCOPES.—Her Majesty's Royal Letters Patent, for valuable and extraordinary improvements in the most powerful and brilliant Telescopes to know the distances of objects viewed through them, at Messrs. S. and B. SOLOMONS, Opticians, 39, Albemarle Street, Piccadilly. Those Telescopes possess such extraordinary powers, that some three and a half inches with an extra eye-piece, will show distinctly Jupiter's moons, Saturn's ring and the double stars; and a person's countenance three and a half miles distant. The Royal Exhibition, 1851.—A valuable newly-invented very small powerful waistcoat-pocket glass, the size of a walnut, to discern minute objects at a distance of from 4 to 5 miles, which is found to be invaluable to SPORTSMEN, GENTLEMEN, and GAMEKEEPERS. Opera and Race-course glasses with wonderful powers. Invaluable newly-invented Preserving Spectacles. Invisible and all kinds of Acoustic instruments for relief of extreme deafness.

QUANTITY AND QUALITY OF THE HAIR.

NO TOILET can be considered complete without a careful attention to that department which so materially affects the entire contour, viz., the Hair, which, both in quantity and quality, is susceptible of the most material alteration. That which is weak can be strengthened, and be made to receive a most beautiful gloss by artificial applications. It is to its extraordinary and valuable properties in these respects that is due the character of C. AND A. OLDRIDGE'S BALM OF COLUMBIA, for its invigorating, nutritious, and regenerative qualities. OLDRIDGE'S BALM causes Eyebrows to grow, prevents the Hair from turning grey, and the first application causes it to curl beautifully, frees it from scurf, and stops it from falling off. Price 3*s.* 6*d.*, 6*s.*, and 11*s.* per bottle. No other prices are genuine.—N.B. Ask for OLDRIDGE'S BALM, 13, Wellington Street North, Strand, London.

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL possesses singularly nourishing powers in the growth, restoration, and improvement of the human Hair, and when every other specific has failed. This celebrated Oil is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. Its operation in cases of baldness is peculiarly active; and in the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulating operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3*s.* 6*d.* and 7*s.*; Family Bottles (equal to four small), 10*s.* 6*d.*; and double that size, 21*s.* CAUTION.—On the wrapper of each bottle are the words, Rowland's Macassar Oil, in two lines. The same are engraven on the back of the wrapper nearly 1500 times, containing 29,028 letters.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.? If so, use Miss GRAHAM'S NIOUKRENE, the most efficacious Hair generant ever introduced. It reproduces the Hair when lost either by disease or decay, prevents its falling off, effectually checks greyness, strengthens weak hair, and is guaranteed to produce those attractive ornaments, Whiskers, Moustachios, Eyebrows, &c., in three or four weeks. For nourishing and beautifying the hair, and sustaining its curling powers in all weathers, it has no equal. Price 2*s.*, and sent post free to any part of the kingdom, on receipt of 24 penny postage stamps, by ELLEN GRAHAM, 3, New Road, Hornsey, Middlesex.—"My hair is quite restored." Miss ORME.—"I have a full pair of Whiskers, thanks to your Nioukrene." H. ROBB, Esq.—"It has checked the greyness." Mrs. JONES.—Sold at 14, Hand Court, Holborn, London.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—EMILY DEAN'S CRINILENE has been many years established as the only preparation that can be relied upon for the Restoration of the Hair in Baldness from any cause, preventing the Hair falling off, strengthening weak Hair, and checking Greyness, and for the production of Whiskers, Moustachios, Eyebrows, &c., in three or four weeks with certainty. It is an elegantly scented compound, price 2*s.*, sold by all chemists, or will be sent post free, on receipt of 24 penny postage stamps, by Miss DEAN, 37 A, Manchester Street, Gray's Inn Road, London.—"I have used your Crinilene, and have now a good pair of Whiskers." J. L. HIGGS, Dudley.—"It has certainly improved my hair." J. THOMPSON, Durham.

HOLLOWAY'S PILLS REMARKABLY EFFICACIOUS IN CURING A CONFIRMED CASE OF DROPSY.—Extract of a letter from Mr. David Simpson, of Collingham, dated March 15, 1854:—"To Professor Holloway. Sir,—I feel it my duty towards you and the public to inform you of a most remarkable Cure of Dropsy, by the use of your Pills. My daughter was a sufferer for years; and, when under medical treatment, she had upwards of 13 pints of water taken away without obtaining any permanent relief; since then she commenced taking your Pills, which I am satisfied has been the sole means of effecting a lasting Cure, as she is now perfectly well."—Sold by all Druggists; and at Prof. HOLLOWAY'S Establishment, 244, Strand, London.

PAINS IN THE BACK, GRAVEL, LUMBAGO, RHEUMATISM, GOUT INDIGESTION, FLATULENCY, NERVOUSNESS, DEBILITY, &c.

DR. DE ROOS' COMPOUND RENAL PILLS, as their name Renal (or the Kidneys) indicates, are a most safe and efficacious remedy for the above dangerous complaints. For depression of spirits, incapacity for society, study, or business, giddiness, drowsiness, nervousness, and insanity itself, when arising from or combined with urinary diseases, they are unequalled. Price 1*s.* 1½*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 11*s.*, and 33*s.* per Box, through all Medicine Vendors, or sent (free) on receipt of the amount in postage stamps, by Dr. DE ROOS, 35, Ely Place, Holborn, London. At Home for consultation daily from 11 till 1, and 5 till 8, Sunday excepted. Advice and Medicines, 1*l.*

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN, having been restored to health in a few days, after many years of great nervous suffering, is anxious to make known to others the means of cure, and will therefore send (free), on receiving a stamped envelope properly addressed, a copy of the Prescription used.—Direct to Rev. E. DOUGLASS, 18, Holland Street, Brixton, London.

THE LATEST DISCOVERY IN ELECTRICITY.

ELECTRICITY IS VITALITY, and when communicated in mild but continuous currents by wearing MEINIG'S patent portable GALVANIC ELECTRO GENERATOR, for personal use. All Nervous, Functional, or Rheumatic Diseases (where no organic change has taken place) disappear with a safety, certainty, and speed, which is as marvellous as it is demonstrable beyond the possibility of a doubt; for the prospectus contains the names and addresses of more than 400 persons cured within the last 18 months by this extraordinary agent, which is moreover adopted in all the Hospitals in this country and in France, and by the first men of the day. The effects being instantaneously perceptible, may be tested freely and beforehand. Price from 5*s.* upwards, according to power. A full description of this extraordinary discovery may be had (by post for two stamps) of C. MEINIG, 103, Leadenhall Street London; or from all respectable Chemists.

N.B. In this new Apparatus durability is secured, and all metallic or wet contact with the body entirely obviated.

It weighs two ounces, and can be worn with the greatest comfort. MEINIG'S ELECTRO GENERATOR, when worn on the Liver, has been found a never-failing preventive of Cholera, supplying the central and hepatic system with vital energy, to resist and counteract all miasmatic influences.

TOBACCO PAPER! TOBACCO PAPER!

THE Cheapest and most effectual article for Smoking Greenhouses, and destroying the Fly on Plants, is Genuine Tobacco Paper, which JOSEPH BAKER, of 73, Fleet Street, can supply in large quantities, at 1*s.* per lb.; and if under 7 lbs. at 1*s.* 2*d.* per lb. Post-office Orders payable at the Strand Office.

JOSEPH BAKER, 73, Fleet Street, London (opposite the *Dispatch* newspaper).

CURE FOR MILDEW ON GRAPES, &c.—In consequence of the increased prevalence of mildew on the Vines, &c., during the last few seasons, G. TABER, of Rose Cottage, Rivenhall, practical Gardener, Seedsman, and Florist, has directed particular attention to the best mode of preventing it, or for curing the Vines that have been attacked, and he now begs to announce that he has succeeded in preparing a composition known as TABER'S ANTI-MILDEW COMPOSITION, which will effectually prevent or cure the disease without doing which will effectually prevent or cure the disease without doing the slightest injury to the Vines; and any person, by the aid of the printed instructions, may use it without risk. It is also an invaluable remedy for preventing Mildew on Wall Trees, Roses, &c. Sold in packets containing 1 lb., 1*s.* 3*d.*; 3 lbs., 3*s.*; 6 lbs. 5*s.* 6*d.*, with directions for use. By enclosing two postage stamps, G. T. will send a circular with full particulars as to quantity required for a house for the season, and also testimonials of the success he has met with.

G. T. will personally attend gentlemen, and give instructions to their gardeners at a reasonable remuneration for time and travelling expenses. The trade supplied at the usual discount. Post Office orders to be made payable to GEORGE TABER, and drawn upon the Witham Post Office. Postage stamps received in payment of small orders. Packets delivered free to the Witham Station of the Eastern Counties line.—Address GEORGE TABER, Rose Cottage, Rivenhall, near Witham.

FORD'S EUREKA SHIRTS, Plain and Coloured, the latter in cloths of every variety of pattern—stripes, curves, bars, spots, sprigs; in short, every figure that art can describe and taste approve. KNOW THYSELF!—Professor BLENKINSOP continues to receive from individuals of every rank the most flattering testimonials of his success in describing the CHARACTERS of Persons from their HANDWRITING, pointing out their mental and moral qualities, whether good or bad.—Address by letter, stating age, sex, and profession, inclosing 13 uncut postage stamps, to Dr. BLENKINSOP, 344, Strand, London.

TO BE LET, for a Cemetery or Market Garden, 50 acres of the BEST LAND in the county of Surrey, 8 miles from London Bridge, situate at Mitcham, adjoining Merton Abbey, in fine condition, and all trenched. Rent moderate. A Lease will be granted if required; further particulars may be had of Mr. HOOK, 13A, Great George Street, Westminster.

TO BE LET, an excellent arable FARM, beautifully situate midway between Guildford and Farnham, containing 135 acres. Immediate possession may be had.

For further particulars apply to Mr. FINNEY, West Surrey Bank, Guildford, Surrey.

TO BE DISPOSED OF, PLANS AND SPECIFICATIONS, by a gentleman about to leave for Australia, who has had a considerable professional practice in Ornamental Gardening, and is desirous of Disposing of his Plans and Specifications, amongst these are Plans of Parks, Pleasure Grounds, Villas, Terraces, Flower Gardens, and Arboretums, including Plans for improving and remodelling these; also Plans of Kitchen and Fancy Gardens, Conservatories, Greenhouses, Stoves, Vineries, Pits, &c., which have been executed in various districts of the country. The Plans will be disposed of in one lot, or in sections. Rural Architecture may be advantageously combined.—Apply to R. S., Mr. Bishop, News Agent, 1, Lily Pot Lane, London.

TO BE SOLD, a Quantity of DECAYED VEGETABLE MATTER, having accumulated for years.—Apply to Mr. WILLIAM FAGGATTER, West End Farm, Aldershot. A large quantity has been used for Plants in the Sydenham Palace. The enclosure from which the mould is dug is about three miles from the Ash Station, on the South Eastern line, and about the same distance from the Farnham and Farnborough Stations, on the South Western line.

TO BE SOLD, a GREENHOUSE, SPAN ROOF, 30 feet long by 21 feet wide, nearly new, with slate Shelves and Paths, heated by hot water, with Blinds and Rollers; also 250 feet of 4-inch Piping, and 500 feet of Slate Slabs, together or separate.—Apply to Mr. CHARTRES, Seedsman, King William Street, City; or Mr. COOK, Park Road, Clapham, near London.

PEA-FOWLS.

TO BE SOLD, a handsome PEACOCK and PEAHEN; the cock four and the hen three years old, price 3*l.* 10*s.* If a purchaser required two Pea-hens, an additional one could be parted with, price 30*s.* The foregoing birds are in full plumage.—Apply, by post, to A. B., Post Office, Wellington, Somerset.

GOLDEN SPANGLED HAMBURGH. — Eggs from PRIZE BIRDS, 7*s.* 6*d.* the sitting of 13. The Cock is well marked all over, nine months older than the Hens, and of a distinct strain.—Apply to Mr. TAYLOR, Godalming, Surrey.

TO AMATEURS OF THE HAMBURGH FOWLS.—A few sittings of Eggs of each class of the Hamburgh Fowls, viz.:—Gold and Silver Pencilled, Gold and Silver Spangled, and Black, to be disposed of in the spring, from birds which have taken thirty prizes at most of the principal Shows during the past season. Eggs will be supplied according to the dates of the orders received. Also, Eggs of Prize Game Fowls and Aylesbury and Rouen Ducks.—Apply to the Feeder, Mr. ROBERT BUGGINS, Beighton Rectory, Acle, Norfolk.

COCHIN CHINA POULTRY, ETC.
EGGS FROM PRIZE BIRDS.

MR. JOHN FAIRLIE, of Cheveley Park, Newmarket, in reply to the very urgent applications from numerous amateurs, is now prepared to dispose of a limited number of Eggs, from his celebrated prize Cochins, Brahma Pootras, Scotch Bakies, Dorkings, &c., according to the dates of the orders received.

COCHIN CHINA FOWLS.

MR. THOMAS GILBERT, of Grays, Essex, having purchased of THOMAS STURGEON, Esq., his entire breed of 1853, Gentlemen and Amateurs are informed the Birds are now on Sale, and are bred exclusively from his best Stock Birds, Jerry and Nelson. Eggs may be had at 16*s.* per dozen, from he above.

EGGS.

MR. PEARSON will supply a sitting of 13 Eggs of the Spotted Dorkings, Gold Pencilled Hamburghs, Gold Spangled do., Silver Pencilled Hamburghs, Silver Spangled do., for 5*s.* each sitting, including package. His Gold Pencilled Hamburghs won the 1st Prize at Birmingham in 1852, and 2d Prize in 1853; the Silver Pencilled won the 1st Prize in 1853 at Birmingham. The Gold Spangled Hamburghs being out at walk, letters for them must be addressed Mr. W. HETLEY, Orton, Peterborough.

The other varieties are kept at Chilwell, near Nottingham.

BRAMAH POOTRA FOWLS' EGGS, 20*s.*; White faced Spanish, 10*s.*; Dorking, 6*s.*; and Aylesbury Duck Eggs, 6*s.* per dozen, warranted fresh from Prize Stock. A few choice Spanish Fowls for sale. A remittance with all orders, and stamp for inquiries.—W. TURNER, Drayton, Abingdon, Berks.

PRIZE WHITE SHANGHAES.—An Amateur, whose stock birds have, during the past season, gained high and distinguished awards at Bedford, Birmingham, Bury, Farningham, Gloucester, Leeds, Manchester, Metropolitan, Surrey Gardens, and Southampton Exhibitions, has for disposal a few first-class Pullets now laying, including some Birmingham and Metropolitan Prize Birds of great merit. Also two first-rate, heavily feathered, vulture-hocked Cockerels; and an imported bird, lately weighing 10½ lbs., winner of prizes at Cheltenham, Halifax, and Yarmouth.—For price, &c., apply to T. B. F., Post-office, Braintree, Essex.

Price from 5*s.* to 6*s.* per bushel, or 4*d.* per lb.

This Grass can be recommended with the greatest confidence.

SEEDS TO IRELAND.—*Plymouth is admirably situated for supplying our sister country with some English Seeds. The Subscribers can refer to some of the leading families in Ireland, who have for many years obtained the whole of their supplies of Garden and Farm Seeds. Seeds delivered free to many of the Irish ports. See Price Current.*

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

RENDLE'S PRICE CURRENT.—Opinion of the Editor of the *Illustrated London News.* See *Illustrated London News*, March 18, 1854.

"This is a scientific catalogue of the Seeds of Garden Plants by Mr. Rendle, of Plymouth, the eminent Nurseryman. The Pamphlet will be very suggestive to all who are fond of a garden, as it contains not only a classified list of every necessary or ornamental Garden Seed, but also the fullest description of the plants, and the mode of cultivating them. We rarely find so much information in so small a compass."

General Priced Catalogues free upon application.

In addition to our great experience, the port of Southampton affords us unrivalled facility for the almost daily shipment of SEEDS to all parts of the world; and as no greater test of genuineness and vitality than a long transit by sea can be applied to Seeds, we yield priority to none in supplying such for home growth as cannot fail to prove most satisfactory.

All parties desirous of taking or sending Seeds to the Peninsula, Mediterranean, East and West Indies, Australia, Brazil, Cape of Good Hope, China, America, &c., are particularly requested to state their wishes to us, whereby the annoyance and disappointment which too frequently happens by placing their orders in the hands of inexperienced persons will be prevented. We are continually receiving the warmest thanks of our consignees; only a few days since, a gentleman writes from Melbourne, "Your Seeds have proved excellent. The selection of Peas has afforded us the greatest delicacy in Australia." From Capt. H. J. Barr, Secretary to the Horticultural Society of Bombay: "*Gentlemen,—In acknowledging the receipt of your last supply of Vegetable and Flower Seeds, which reached me on the 8th of June by the overland route, I have the honour to inform you that they have all turned out so fresh and good that the demands on our Society have increased so much that I must now cancel my former order, and beg you to supply me according to the list now furnished.*"

PAGE & CO.'S BLIGHT COMPOSITION should be in the hands of all Plant and Fruit Cultivators. For testimonials see back leaf of *Gardeners' Chronicle*, March 11.

CHARLES ALEXANDER, SEEDSMAN AND FLORIST,
32, West Register Street, Edinburgh.

SUPERB SEEDLING POTENTILLAS, RAISED BY BASS AND BROWN.

"This fine Perennial is not grown a tithe of what it should be."—*G. Glenny.*

We have the pleasure to offer the following very beautiful Potentillas, which we have selected from a large and much admired batch of Seedlings. We intend to send them out in May, and all orders are recommended to be forwarded early, as the stock of some of them may run short. We quote as under several authorities to whom they have been submitted for opinion:—

"All are very handsome kinds, and well worthy of cultivation."—*Gardeners' Chronicle*, July 3, 1852.

"We see no reason to alter our opinion formerly given of your Seedlings; they are certainly all very fine."—*Gardeners' Chronicle*, July 16, 1853.

"The whole appear bright, and many of them novel. They would make a pretty collection of a very pretty perennial, which from this batch of Seedlings seems to be going a-head."—*G. Glenny*, July 17, 1853.

"A very interesting collection of this useful hardy plant in great variety of colours, many of them being quite new and beautifully varied."—*Turner's Florist*, Sept. 1, 1853.

"We were not aware until we received specimens of these that there were so many beautiful varieties at the command of the gardener. All very rich and fine."—*Cottage Gardener*, July 28, 1853.

A letter from Mr. C. Turner, of July 29, states, "Your Potentillas are exceedingly fine and beautiful."

KING OF CRIMSONS, rich bright blood red, very large, and of dwarf habit ... ... 10*s.* 6*d.*

"Decidedly the most striking is No. 21, a deep scarlet crimson."—*Gardeners' Chronicle*, July 3, 1852.

"All very fine, more especially No. 21, which measures about 2 inches in diameter."—*Gardeners' Chronicle*, July 16, 1853.

"Deep blood, very large."—*Cottage Gardener*, July 28, 1853.

"Immensely large, bright blood, rich in texture, and above the average form."—*G. Glenny*, July 2, 1853.

THEODORE, a fine yellow, richly spotted, and shaded with bright red ... ... 7*s.* 6*d.*

"A good orange yellow, tipped."—*Gardeners' Chronicle*, July 16, 1853.

George Glenny, in selecting it as one of the finest, describes it as "yellow, shaded with bright red."

JULIA, a fine large primrose yellow ... ... 7*s.* 6*d.*

The Editor of the "Cottage Gardener" in selecting this from many others as one of the finest, describes it as "a very pale clear yellow."—July 28, 1853.

SUDBURY GEM, a rich orange yellow, deeply shaded and spotted with bright red ... ... 10*s.* 6*d.*

"A very beautiful variety, orange, veined upwards from the base with crimson."—*Cottage Gardener*, July 28, 1853.

SHYLOCK, a very rich dark velvet maroon, large, fine, and attractive ... ... 10*s.* 6*d.*

"Rich and dark."—*George Glenny*, July 17, 1853.

The set for 42*s. The usual allowance to the trade by taking two or more sets.*

The following SEEDLINGS are also very fine, rich, and showy:

FLORAL BEAUTY, a rich scarlet, dark centre ...	3*s.*	6*d.*
NAPOLEON, blood red, dark centre	2	0
DEFIANCE, rich dark crimson	2	0
NEGRESS, rich dark velvet maroon	3	6
SCARLET GEM, bright scarlet, black centre ...	3	6
PRIMROSE, a fine large clear yellow...	2	0
ARGO, a fine bright yellow	2	0

This set for 16*s.*

Seed and Horticultural Establishment, Sudbury, Suffolk.

G. RUSSELL begs to offer the following:—2000 Evergreen Oaks, two year plants, 6*s.* per 100; 450 Evergreen Oaks, one year plants, 5*s.* per 100; 700 Privets, three year plants, 3 ft. high, 14*s.* per 100.—20, Sussex Road, Brixton.

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, &c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidence, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introduced by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant bloomer; and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21*s.*

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gaufred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes. Each 21*s.*

GERMAN DOUBLE DAISIES.—A fine healthy stock of the above unique Flower is now offered to the Public. It is very novel and distinct, and such as will give all purchasers satisfaction. Out of the 100 imported varieties, 50 of the most striking and best flowers have been selected, and can be sent out from one dozen plants, and upwards. These Daisies surpass everything for making edgings to flower beds, &c., and are quite a novelty of their kind; price 3*s.* 6*d.* per dozen, postage and package free; or 1*l.* 1*s.* per hundred, hamper and package free.

Also a fine stock of MYOSOTIS VANGLEEKI, or the new improved Forget-me-Not, well adapted for rock-work or making single beds; 2*s.* 6*d.* per dozen, postage free; 15*s.* per hundred, package free.

SWEET WILLIAMS.—A fine stock of very select and striking varieties 2*s.* per dozen, or 10*s.* per hundred, package free.

CHOICE HOLLYHOCK SEED saved from all the best and latest varieties yet sent out; 1*s.* 6*d.* per packet.

SEEDLING ANTIRRHINUM SEED, all from striped and spotted flowers, and will give every one satisfaction; 1*s.* per packet.

GERMAN ASTER SEED, saved from all first prize flowers; 1*s.* per packet.

STRAWBERRY PLANTS.—This is an excellent opportunity for those to plant who may have neglected to do so last autumn. Victoria, 5*s.* per 100; Prolific, 3*s.* 6*d.* per 100; Eleanor, 3*s.* 6*d.* per 100; Surprise, 3*s.* 6*d.* per 100; Cremont's Perpetual, 5*s.* per 100; and many other leading varieties, package free. The above named will be sufficient to give a supply of fruit the whole of the Strawberry season, being the earliest and latest varieties.

CUCUMBER and MELON SEEDS can be still supplied in varieties, and price, as advertised on the 18th ult. On receipt of a money order, or penny postage stamps, the whole, or any part of the above, will be immediately forwarded.

EDWARD TILEY, Nurseryman and Seedsman, No. 14, Abbey Churchyard, Bath, Somerset.

KNAP HILL NURSERY, WOKING, SURREY.

WATERER AND GODFREY, Nephews and Successors to the late HOSEA WATERER, respectfully invite the attention of parties engaged in planting to the following list:—

Araucaria imbricata, 2, 3, 4, 5, and 6 feet high, in the open quarters, regularly removed every year, and as robust and handsome as it is possible to get them. We have a large stock.
Cryptomeria japonica, 2, 3, 4, 5, 6 to 8 feet.
Cedrus Deodara, stout handsome plants from seed, in any quantity, and of all heights from 1 to 7 feet. A few splendid specimens 10 to 15 feet; warranted to transplant with perfect safety.
Cedar of Lebanon, 2, 3, 4, 5, 6, 7 to 10 feet. These large Cedars of Lebanon are also very handsome trees.
Cupressus macrocarpa, or Lambertiana, 2, 3, 4, 5, 6, and 8 feet, all from seed.
" Goveniana, 2 to 3 and 4 feet.
" Funebris, 2 and 3 feet.
" thyoides variegata, 2, 3, and 4 feet.
The Variegated White Cedar, a scarce but most beautiful variegated plant, seldom seen except at Elvaston Castle. We hold a large quantity.
Juniperus Bedfordiana, fine plants, 3, 4, and 5 feet.
" Chinese, 2, 3, 4, 5, 6, 8, and 10 feet.
" repandus, 3, 4, 5, to 8 feet.
" Upright Irish, 3, 4, 5, 6, 7, and 8 feet; perfect columns, and, except at Elvaston, unequalled.
" Virginiana, the Red Cedar, 4, 5, 6, and 8 feet.
Taxodium sempervirens, 2, 3, 4, 5, and 7 feet.
Yew, common, 3, 4, 5, to 8 feet high.
" Irish, 3, 4, 5, to 10 feet. A splendid lot, all being trimmed to one stem; it adds much to their appearance and value.
" Gold striped, 1, 2, and 3 feet.
" do. worked on the Common, with fine heads, 4, 5, 6, and 7 feet high; very handsome.
" elegantissima (new striped) standards. The golden Yews are very ornamental, and we have a large quantity of fine plants.
" Dovaston, or Weeping Yew, fine standards.
Pinus Douglasi, 3, 4, 5 and 7 feet; a few magnificent plants, 10 to 12 feet high.
" insignis, 2, 3, 4, 5, 6, and 7 feet; all from seed.
" cembra, 3, 4, to 6 feet.
" Canadensis (Hemlock Spruce), 3, 4, and 6 feet.
" morinda, 3, 4, and 6 feet.
" Menziesi, 3, 4, 6, and 8 feet.
" cephalonica, 3 to 4 feet.
" Pinsapo, large and handsome, 3 and 4 feet.
" Nordmaniana, from seed, 1½ foot; a few larger, 2 feet.
" nobilis, stout plants, with perfect heads, about 1½ foot; a few larger specimens, 3 and 4 feet. We hold a fine stock of this beautiful Fir, none of which are grafted.
Thuja Arbor-vitæ, American, 3 to 6 feet. We recommend this plant for hedges.
" Weareana, 3 to 6 feet, one of the few really hardy and most useful evergreens.
" aurea. This is perhaps one of the prettiest plants of the day; it was first sent out from this Nursery, and our stock, for size and beauty, is unsurpassed.
Libocedrus chilensis, 1½, 2, and 3 feet. This is a very distinct and beautiful plant, of recent introduction. Our stock is large and good.

Independent of the foregoing we are very large holders of the most useful Evergreens, Deciduous and Ornamental Trees, and of large size. Priced Catalogues will be forwarded on application, enclosing two postage stamps, which will also include a Descriptive Priced Catalogue of the celebrated collection of American Plants grown at this Nursery.

The Nursery is near the Woking Station, and about an hour's ride from London. A visit is earnestly solicited from all who intend planting during the forthcoming season.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church Row, Stoke Newington, both in the County of Middlesex, Printers, at their Office, in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, APRIL 1, 1854.

OFFICE FOR ADVERTISEMENTS AND COMMUNICATIONS,
5, Upper Wellington Street, Covent Garden, London.

HORTICULTURAL SOCIETY OF LONDON.—Notice is hereby given that the EXHIBITIONS OF FLOWERS AND FRUIT, in the SOCIETY'S GARDEN, in the present season, will take place on the following SATURDAYS, viz: May 13, June 10, and July 8; and that TUESDAY, April 25, is the last day on which the usual privileged Tickets are issued to Fellows of the Society.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.—The days appointed for the EXHIBITIONS of PLANTS, FLOWERS, and FRUIT this season are WEDNESDAYS, May 24, June 21, and July 5; and of AMERICAN PLANTS, MONDAYS, June 12 and 19.

Tickets of Admission can be obtained at the Gardens by orders from Fellows of the Society. Price on or before May 13, 4*s*.; after that day, 5*s*.; or on the days of Exhibition, 7*s*. 6*d*. each.

The Plants will be arranged on a new plan, similar in form to the American Garden, being placed upon terraces.

SOUTH LONDON SOCIETY OF AMATEUR FLORISTS.

NOTICE TO EXHIBITORS.—In consequence of the unprecedented forwardness of the Season, the AURICULA EXHIBITION will take place on THURSDAY, 20th April, instead of Wednesday, the 26th, at the Horns Tavern, Kennington.

Horns Tavern, April 8. JOHN BUSHELL, W. TEABAR } Hon. Secs.

GRAND NATIONAL TULIP EXHIBITION FOR 1854.—It will gratify all who are interested in this event, to learn that the Council of the Royal Botanic Society of London have given permission to hold the annual meeting of the GRAND NATIONAL TULIP EXHIBITION for 1854, at the Society's Gardens, in the Regent's Park, in connexion with the Royal Botanic Society's first show, on WEDNESDAY, May 24. Schedules and full particulars will be shortly announced. In the mean time communications are to be sent to CHARLES TURNER, Royal Nursery, Slough.

BRIGHTON FLORICULTURAL AND HORTICULTURAL SOCIETY.—ROYAL PAVILION.—The Annual Summer Exhibition of Plants, Flowers, and Fruits, will be held on WEDNESDAY and THURSDAY, the 28th and 29th June next, on the same grand scale as last year. Upwards of 200 guineas are offered as Prizes. Schedules are now ready, and may be had on application to the Secretary, Mr. E. CARPENTER, 45, Lavender Street. By order of the Committee,

Brighton, April 8. EDWARD CARPENTER.

NEW ROSES FOR 1854.

BENJAMIN R. CANT has now ready for sale, strong plants in pots of all the NEW ROSES, some of which have never before been offered to the public, descriptive Catalogues of which can be had on application.

St. John's Street Nursery, Colchester.

THE NIMROD STRAWBERRY.

LUCOMBE, PINCE, AND Co., respectfully inform the Public that they are now sending out this fine new Strawberry at 3*l*. per 100. The great superority of the

NIMROD STRAWBERRY

has been acknowledged by many competent judges. Dr. Lindley pronounces it to be "superior to the British Queen, sweeter and richer." See the *Gardeners' Chronicle* of July 23d, 1853, p. 472. Mr. Spencer, of Bowood, a first-rate authority in all that appertains to Horticulture, speaks very highly of it in the same publication, July 30, p. 485. It has also been proved to force exceedingly well.—Exeter Nursery, April 8, 1854.

TO BE SOLD, six finely grown CAMELLIAS, specimens averaging 6 to 9 feet high. Also a fine plant of Acacia armata.—For particulars apply to W. F. B., Box 26, Exeter.

TO BE DISPOSED OF, 100 Bushels of LAING'S PURPLE-TOP SWEDE TURNIP SEED; an excellent Stock, and Transplanted by W. WOODCOCK, Agricultural Seedgrower, Wisbeach.

FIG TREES.—The Advertiser wishes to meet with some of the best kinds and good size, say 3 to 5 feet high, and furnished. He will be obliged to any one having such to dispose of sending particulars of size, kind, price, and whether in or out of pot, to MR. PERRY, Nurseryman, Banbury.

BEAUTIFUL NEW BEDDING PLANT.
MILLER'S HYBRID MULE PINK.

ROBERT MILLER, Hartshill, Nursery, Newcastle, Staffordshire, offers with confidence the above Pink, colour a bright crimson scarlet, double; grows from 9 to 15 inches high, branches out and forms a little bush, and flowers most abundantly from June to October, and perfectly hardy. See *Gardeners' Chronicle*, Sept. 24, 1853.

DIANTHUS R. M., very pretty, and being dwarf in habit, it will doubtless make a good bedding plant. Price 12*s*. per doz., package included. The usual discount to the Trade. To be let out the second week in April. Post-office orders from unknown correspondents made payable at Newcastle.

GRASS SEEDS FOR PERMANENT PASTURE.

WHEELER AND SON'S DESCRIPTIVE LIST of GRASS SEEDS will be forwarded free on application.

J. C. WHEELER AND SON, GLOUCESTER.

A FIRST CLASS CATALOGUE OF GERANIUMS, VERBENAS, FUCHSIAS, DAHLIAS, HOLLYHOCKS, ETC.

GEO. SMITH begs to announce that the above is now ready, and will be forwarded in exchange for one postage stamp.—Tollington Nursery, Hornsey Road, Islington.

A. VAN GEERT, NURSERYMAN, Ghent, Belgium, begs to inform amateurs and the trade that he has just published a SUPPLEMENT to his CATALOGUE of PLANTS for the present year, which may be obtained on application to his Agent, Mr. R. SILBERRAD, 5, Harp Lane, Great Tower St., London.

ROBERT M. STARK begs to intimate that his Spring Catalogue of FLORISTS' FLOWERS, BEDDING PLANTS, &c., for the season, is now ready and may be had on application.

Very superior assortment of Imported GERMAN FLOWER-SEEDS, NEW ANNUALS, &c., of which separate Lists may be had.—Edinburgh: Edgehill Nursery, and 145, Princes Street.

UNBLOOMED SEEDLING CALCEOLARIAS.

C. KIMBERLEY has a large stock of the above; the seed was saved from that well-known favourite Kinghorn's Masterpiece, and other splendid kinds, carefully impregnated. The plants are nice and healthy, established in small pots, and may be had at 6*s*. per dozen, or three dozen for 15*s*., Hamper included.

Nurseries; Pinley and Stoke, near Coventry.

PERMANENT PASTURE.

R. H. SMITHE, of Eastling, Faversham, Kent, is now prepared to send out his Mixtures of the NATURAL GRASSES, PERENNIAL CLOVERS, &c., to lay down Land to Permanent Pasture, at 25*s*. per acre, allowing 3 bushels to the acre, carriage free. Mixtures for Lawn, or any other purpose, or the sorts separate. Most of the species of Grass are collected by the Advertiser, and he will bestow the greatest attention in selecting such as shall constitute mixtures specifical to the soil, purpose, &c., of each buyer.

PINUS SABINIANA,
THE GREAT HOOKED CONE PINE OF CALIFORNIA.

PETER LAWSON AND SON, Edinburgh, have just received from San Francisco a small consignment of Seeds of this fine Hardy Pine. Price 2*l*. 2*s*. for 100 selected Seeds, free by post. They were gathered last autumn, and are in excellent condition and well grown—the seeds measuring about 1 inch in length. Being perfectly hardy, they may be sown in a dry sheltered situation in the open air.—Edinburgh, April 8.

"WELLINGTONIA GIGANTEA."

MESSRS. VEITCH, of EXETER and CHELSEA, have much pleasure in stating that their Seeds of the above magnificent Tree are vegetating satisfactorily. They therefore hope to be able to send out well established seedling plants during the ensuing summer and autumn. They are now taking orders for them at the following prices:—

For a Single Plant	2 guineas	For 8 Plants	10 guineas
For 4 Plants	6 guineas	For 12 Plants	12 guineas

And all orders will be executed strictly in the rotation in which they are received.—April 8.

WELLINGTONIA GIGANTEA.—Beautiful Lithographed Plates (from a drawing taken in California) of this wonderful Tree may be had, at 7*s*. 6*d*. each, of Messrs. VEITCH & SON, Exeter, and Mr. JAMES VEITCH, jun., Exotic Nursery, Chelsea.

The Bark, Wood, Cones and Foliage, which were exhibited on Tuesday week at 21, Regent Street, may be seen at the Exotic Nursery, Chelsea.—April 8.

E. SPARY respectfully announces that he has commenced cutting HOTHOUSE GRAPES in fine condition, and will have a constant supply through the year.

His New Dahlias, Ariel and Glory, with other first-rate sorts, will be ready, in fine plants, on the 1st of May. Catalogues of which, including a variety of Plants ornamental to Greenhouses, Drawing-rooms, and Flower Gardens, may be had on application. Vines, Seeds, &c.—Queen's Graperies, and Western Road, Brighton.

DOUBLE ITALIAN TUBEROSE ROOTS, 4*s*. per dozen.—The annual importation of the above-named beautiful and fragrant Flower has just been received, and large and well selected Bulbs may be obtained, without disappointment, at A. COBBETT'S Foreign Warehouse, 18, Pall Mall.

N.B. Printed regulations for treatment sent; also, just arrived, very moist and open Parmasan Cheeses.

SUPERB SHOW CARNATIONS, PICOTEES, PINKS, AND PANSIES.

JOHN HOLLAND, Bradshaw Gardens, Middleton near Manchester, is now sending out choice selections of the above, in strong well-rooted plants, package, &c., included.

25 pairs of Show Carnations in 25 different varieties			£1	0	0
25 pairs of Picotees	do.	do.	1	0	0
25 pairs of Pinks	do.	do.	0	10	0
25 pairs of fine show Pansies, in 25 distinct varieties			0	12	0

Auriculas, Alpines, Polyanthuses, &c. Extra fine selected Pansy Seed, 1*s*. and 2*s*. per packet. A few packets of Auricula Seed, extra fine, 2*s*. 6*d*. per packet. Priced and Descriptive Catalogues are now ready, and may be had for one postage stamp. Post Office orders to be made payable at Middleton, Lancashire.

J. H. begs to refer to his Advertisement in this Paper of March 25th, for names of a portion of his stock of Pansies.

INGRAM'S PRINCE OF WALES STRAWBERRY.—This splendid new Strawberry, now so extensively grown at the Royal Gardens, Frogmore, both for forcing and out-door culture, may now be had of J. AND E. SMALL, at the following reduced prices:—Strong well-rooted Plants, 25*s*. per 100, or 15*s*. for 50. This is quite a distinct Strawberry to the Prince of Wales now being sent out by Mr. Cuthill, of Camberwell. Order Ingram's Prince of Wales.

The following new kinds can also be supplied at moderate prices:—Trollope's Victoria, Myatt's Supernne, do. Prolific, Nicholson's Ajax, do. Ruby, and Jackson's Britannia. The usual discount to the trade.—Agents, Messrs. NUTTING & SONS, Seedsmen, 46, Cheapside, London.

GERANIUMS.

BASS AND BROWN

Having this season a very large stock of GERANIUMS, are enabled to offer the following of strong and very fine plants, in 4-inch pots, ready for immediate re-potting, which will yield an abundant bloom. For Descriptive List, see Autumn Catalogue,

SEED & HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

FUCHSIA "TRENTHAM."

COLE AND SHARP, Aston Lane Nursery, near Birmingham, have the satisfaction to announce that they are preparing to send out the above noble seedling Fuchsia, which they feel confident, from its colour, habit, and fine character, will be generally regarded as a desideratum, both in the Conservatory and for exhibition purposes. The following critical remarks upon its merits will show the high estimation in which it is held by competent judges.

"Your Fuchsia is a bold and distinct variety, with remarkably broad scarlet sepals, and a fine purple corolla, of good substance and brilliant colour. It may not reflex sufficiently for some parties, but its bold properties will doubtless render it a great favourite."—*Mr. Charles Turner, Royal Nursery, Slough.*

"Your bloom has good broad sepals, and is a stout and well reflexed flower; the foliage is fine. It will prove an addition to its class, or we are mistaken."—*The Midland Florist, October* 1853.

The Censors of the Birmingham and Midland Society for the Promotion of Floriculture, who awarded this Fuchsia a first-class certificate, stated—"The blooms are unusually large, well proportioned, and of good substance. the sepals being of a brilliant scarlet colour, very broad, and gracefully reflexed. The corolla is of a purplish mazarine blue, smooth, and velvety. The foliage is fleshy, large, and handsome."

Plants, 10*s.* 6*d.*, with the usual allowance to the trade. Coloured engravings (mounted) forwarded on receipt of address, accompanied by six postage stamps.

GRASS SEEDS, ETC.

THOMAS GIBBS AND CO. (the SEEDSMEN to the Royal Agricultural Society of England), corner of HALF-MOON STREET, Piccadilly, beg to draw attention to their Grass Seeds for Laying down Land to Permanent Grass. The Grass Seeds which they employ in forming the Mixtures for various soils are well cleaned under their own superintendence.

„ Hybrids, Gibbs' Green Top
„ Globes, Tankards, &c.
„ FARM SEEDS of all descriptions.

Priced Lists, Detail Catalogues, and other information can be obtained on application to THOMAS GIBBS & CO.

DILCOCK'S BRIDE BROCCOLI.

BAINBRIDGE AND HEWISON (late Jas. Edward), have the pleasure of again offering to their friends and the public their DILCOCK'S BRIDE BROCCOLI, at 2*s.* 6*d.* per packet; and while returning their thanks to their numerous patrons of last season, they beg to refer them to the following extract, taken from the *Yorkshireman* newspaper of the 30th of April last, when it was exhibited at York, for the fourth time:—"Mr. Dilcock deservedly obtained all the three prizes for Broccoli with his seedling—the 'Bride.' Taking the season into account, these vegetables were really remarkable specimens." It was equally successful the two previous years.

B. & H. are prepared to send out their Catalogues of Kitchen Garden and Flower Seeds, post free, on application, and also their Catalogue of Plants is now ready, containing Stove, Greenhouse, &c., including many of the newest and choicest of the season. Their Seeds will be of the very best quality, and in the greatest possible variety.

Sold Wholesale by NOBLE, COOPER, & BOLTON, Fleet Street; CHARLWOOD & CUMMING, Covent Garden; and by all respectable Seedsmen in town and country.—York Nurseries, April 8.

FIRST CLASS NEW VERBENAS.

GEORGE SMITH, in offering the following, warrants them to give entire satisfaction; having this season raised three times the usual number from seed, and with greater success than usual, has been able to select twelve distinct and beautiful varieties, which G. S. flatters himself cannot fail to please.

CALIBAN—Rosy purple crimson, extra large, smooth on the edge and of fine form, has taken First-class Certificates at the National, Brighton, and North London Floricultural Societies.

CLIMAX—Rosy purple, eye shaded with crimson maroon, extra large, of fine form and extra fine show flower.

ANGELINA—Rosy purple, primrose eye, very large, of fine shape. First-class at the Royal Surrey Gardens.

ELECTRA—Bright lilac, fine conspicuous eye, large, of exquisite form. First-class at the Royal South London and the North London Societies.

ISLINGTON RIVAL—Bright scarlet, eye white, flower large and smooth, a free bloomer. First-class Certificate at the National, Brighton, Royal South London and North London.

NOBLISSIMA—Rosy peach, with conspicuous white eye, truss large, of exquisite form. First-class at the Royal South London, also the North London.

FORGET-ME-NOT—Lavender, with large crimson purple eye, a most conspicuous variety, of fine form, extra large and a profuse bloomer. First-class at the Royal South London, Brighton, and the North London.

TRIUMPH—Scarlet crimson, eye white, surrounded with maroon, form exquisite. First-class at the Royal South London, National, and North London.

QUEEN—Pure white, the eye surrounded with bright cherry, pip extra large and smooth. First-class at the Royal South London and North London.

SCARLET KING—Deep scarlet with white eye, fine habit, a free bloomer, flowers large, extra fine bedder.

MAGNIFICENT—A brilliant puce, of fine form, truss large, very free, surpassing all of its class, either a show or bedding var.

ZARIA—Rich lilac, dark eye, large, of fine form, an extra fine variety.

The Set of 12 for 21*s.*, or 6 for 25*s.*, in strong plants, about the 20th of April.

FUCHSIA "TELEGRAPH."

This splendid variety will be found an acquisition. The Plant is of fine growth and habit; the contrast is greater than in any other dark Fuchsia; the tube and sepals are smooth, the latter thick and broad, of brilliant coral red, well reflexed; corolla deep violet, of good size, and circular; quite equal to and distinct from Glory and Nil Desperandum. Strong Plants about the 20th of April, at 10*s.* 6*d.*; with all the leading varieties of Florists' Flowers. Catalogues forwarded in exchange for one postage stamp.

Tollington Nursery, Hornsey Road, Islington, London.

KNAP HILL NURSERY, WOKING, SURREY.

WATERER AND GODFREY, Nephews and Successors to the late HOSEA WATERER, respectfully invite the attention of parties engaged in planting to the following list:—

Araucaria imbricata, 2, 3, 4, 5, and 6 feet high, in the open quarters, regularly removed every year, and as robust and handsome as it is possible to get them. We have a large stock.

Cryptomeria japonica, 2, 3, 4, 5, 6 to 8 feet.

Cedrus Deodara, stout handsome plants from seed, in any quantity, and of all heights from 1 to 7 feet. A few splendid specimens 10 to 15 feet; warranted to transplant with perfect safety.

Cedar of Lebanon, 2, 3, 4, 5, 6, 7 to 10 feet. These large Cedars of Lebanon are also very handsome trees.

Cupressus macrocarpa, or Lambertiana, 2, 3, 4, 5, 6, and 8 feet, all from seed.
„ Goveniana, 2 to 3 and 4 feet.
„ Funebris, 2 and 3 feet.
„ thyoides variegata, 2, 3, and 4 feet.

The Variegated White Cedar, a scarce but most beautiful variegated plant, seldom seen except at Elvaston Castle. We hold a large quantity.

Juniperus Bedfordiana, fine plants, 3, 4, and 5 feet.
„ Chinese, 2, 3, 4, 5, 6, 8, and 10 feet.
„ repandus, 3, 4, 5, to 8 feet.
„ Upright Irish, 3, 4, 5, 6, 7, and 8 feet; perfect columns, and, except at Elvaston, unequalled.
„ Virginiana, the Red Cedar, 4, 5, 6, and 8 feet.

Taxodium sempervirens, 2, 3, 4, 5, and 7 feet.

Yew, common, 3, 4, 5, to 8 feet high.
„ Irish, 3, 4, 5, to 10 feet. A splendid lot, all being trimmed to one stem; it adds much to their appearance and value.
„ Gold striped, 1, 2, and 3 feet.
„ do. worked on the Common, with fine heads, 4, 5, 6, and 7 feet high; very handsome.
„ elegantissima (new striped) standards. The golden Yews are very ornamental, and we have a large quantity of fine plants.
„ Dovaston, or Weeping Yew, fine standards.

Pinus Douglasi, 3, 4, 5 and 7 feet; a few magnificent plants, 10 to 12 feet high.
„ insignis, 2, 3, 4, 5, 6, and 7 feet; all from seed.
„ cembra, 3, 4, to 6 feet.
„ Canadensis (Hemlock Spruce), 3, 4, and 6 feet.
„ morinda, 3, 4, and 6 feet.
„ Menziesi, 3, 4, 6, and 8 feet.
„ cephalonica, 3 to 4 feet.
„ Pinsapo, large and handsome, 3 and 4 feet.
„ Nordmaniana, from seed, 1½ foot; a few larger, 2 feet.
„ nobilis, stout plants, with perfect heads, about 1½ foot; a few larger specimens, 3 and 4 feet. We hold a fine stock of this beautiful Fir, none of which are grafted.

Thuja Arbor-vitæ, American, 3 to 6 feet. We recommend this plant for hedges.
„ Wareana, 3 to 6 feet, one of the few really hardy and most useful evergreens.
„ aurea. This is perhaps one of the prettiest plants of the day; it was first sent out from this Nursery, and our stock, for size and beauty, is unsurpassed.

Libocedrus chilensis, 1½, 2, and 3 feet. This is a very distinct and beautiful plant, of recent introduction. Our stock is large and good.

Independent of the foregoing we are very large holders of the most useful Evergreens, Deciduous and Ornamental Trees, and of large size. Priced Catalogues will be forwarded on application, enclosing two postage stamps, which will also include a Descriptive Priced Catalogue of the celebrated collection of American Plants grown at this Nursery.

The Nursery is near the Woking Station, and about an hour's ride from London. A visit is earnestly solicited from all who intend planting during the forthcoming season.

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.
ESTABLISHED 1786.

CANADIAN SEEDS.

COCKBURN & BROWN, NURSERYMEN, SEEDSMEN, and FLORISTS, Montreal, solicit orders for the seed of Balsam and Spruced Firs, Canadian Larch or Tamasac, Red and White Pine, American Oaks, Sumachs, &c. We particularly refer to the beautiful Hemlock Spruce, any quantity of the seed of which we will undertake to furnish. They can be sent from Montreal either by steam or sailing ship. Samples can be had from Mr. JOHN BROWN, 44, Norfolk Street, Glasgow.—Orders for next Autumn delivery to be sent not later than middle of August. We can furnish all sorts of Canadian Plants.—April 8, 1854.

CALCEOLARIAS FOR BEDDING.—The following four very handsome varieties will be found the gems of the season for bedding purposes, at 12*s.* per dozen.
CRIMSON KING (Henderson), deep crimson, very dark and rich, and does not fade; habit dwarf and robust, flowers large, and shape good.
MAGNIFICENT (Henderson), rich crimson, with yellow crown; a large, fine-formed, and very splendid flower, quite distinct from anything yet out.
GOLD CHAIN, fine golden yellow, of great substance and fine habit, with very stout foot-stalks.
GOLD CAP (Garraway), rich dark maroon, the upper division of the flower deep gold colour, the flowers large and of fine compact habit.

Also the following older favourites for bedding:—
BEAUTY OF MONTREAL, fine bright crimson, dwarf habit, 6*s.* per dozen.
WELLINGTON HERO, rich deep golden yellow, 6*s.* per dozen.
SULTAN, large rich crimson, 6*s.* per dozen.
MRS. BEECHER STOWE, fine canary, 9*s.* per dozen.
SULPHUREA SPLENDENS, fine yellow, dwf. habit, 6*s.* per doz.
Calceolarias (Seedlings not yet flowered) raised from "Benary's" superb spotted varieties, 5*s.* per dozen, post free.
GERANIUM—Boule de Neige, a pure white-flowering horse-shoe leaved variety, of compact habit, producing large trusses of well formed flowers, 2*s.* 6*d.* each.
" Kingsbury Pet, a bright rosy salmon, with dark horse-shoe leaf and of the same habit as the foregoing, 2*s.* 6*d.* each.
" Flower of the Day, 6*s.* to 9*s.* per dozen.
" Crimson Ivy-leaved; this fine variety sent out by Messrs. Standish & Noble, 5*s.* each. (Splendid for bedding).
HOLLYHOCKS—Walden Gem, Mr. Charles Baron, Magnum Bonum, Commander-in-Chief, Venosa rubra, Formosa, and Lilac Perfection, 12*s.* per dozen.
PANSIES.—The following choice kinds, at 10*s.* per dozen varieties:—Alba Superba, Androcles, Blanche, Cæsar, Calysto, Caroline, Commander-in-Chief, Crystal Palace, Drusilla, Duchess of Rutland, Elegant, Emma, Euphemia, Glory, Helen, Heroine, Indian Chief, Isabella, Junius, Lady Carrington, Lady Franklin, Lady Harding, Lord Jeffery, Marchioness of Lothian, Masterpiece, Miriam, Miss Talbot, Mrs. Beck, Penelope, Polyphema, Post Captain, Prince Arthur, Princess, Queen of England, Rubens, Sambo, Smolensko, The Rajah, Uttoxeter Hero, Viceroy, Yellow Prince.
Pentstemon speciosum. This fine old species, in strong plants, 18*s.* per dozen.
Delphinium Mooreanum. This little known variety, raised in this neighbourhood, is undoubtedly a very fine and distinct plant, and worthy to be ranked with Barlowi and Grandiflorum; its colour is somewhat intermediate between the two. Strong plants, 1*s.* 6*d.* each.
Delphinium Barlowi, fine, 9*s.* per dozen.
Daisies, new Belgian, in 50 fine varieties, 4*s.* per dozen.
Dielytra spectabilis, 9*s.* per dozen.
Funkia grandiflora, 2*s.* 6*d.* each.
Rockets, double white, 3*s.* per dozen; purple, 4*s.* per dozen; crimson, 1*s.* 6*d.* each.
Oxalis rosea, one of our prettiest hardy herbaceous plants, and nearly always in flower, 6*s.* per dozen.
Pæonies, herbaceous, in 25 fine varieties, 12*s.* per dozen.
Phloxes, in numerous fine varieties, 6*s.* to 9*s.* per dozen.
Potentilla M'Nabiana, and other choice kinds, 6*s.* per dozen.
Primrose, double white, 4*s.* per dozen; double yellow, 4*s.* per dozen; double purple, 4*s.* per dozen; double lilac, 3*s.* per dozen; double crimson, 12*s.* per dozen.
Silene maritima plena, fine double white, 9*s.* per dozen.
Statice latifolia, strong, 9*s.* per dozen; maritima rosea, very pretty and distinct, 6*s.* per dozen.
Choice selection of Herbaceous Plants, 25*s.* per 100.
Lilium colchicum may be described as a yellow L. lancifolium, as it resembles this fine species in shape of flower; strong bulbs, 7*s.* 6*d.* each; L. lancifolium album, flowering bulbs, 9*s.* per dozen; L. rubrum, flowering bulbs, 18*s.* per dozen.
CHRYSANTHEMUMS, comprising the very best of the new kinds of large flowering and Pompon varieties, in strong plants, 6*s.* to 9*s.* per dozen.
TREE CARNATIONS, of the choicest kinds, by name, 18*s.* per dozen.
CARNATIONS AND PICOTEES.—Beautiful selections from their superb and extensive collections, at 18*s.*, 24*s.*, and 30*s.* per dozen pairs; fine mixed, for borders, 9*s.* per dozen pairs. True Old Clove Carnation, 12*s.* per dozen pairs.
PINKS.—Extra fine sorts by name, 9*s.* to 12*s.* per dozen pairs.
30 packets of Choice Flower Seeds, per post free, for 5*s.*

☞ Less quantities than those named above supplied at the same prices. Orders of 2*l.* and upwards are delivered Carriage Free to London or Hull, or to any Railway Station within 150 miles of the Nursery. Catalogues will be forwarded free on application.
ANEMONE SEED, saved from selected roots, 10*s.* per lb. The usual discount to the trade.

YOUELL & Co., Royal Nursery, Great Yarmouth.

BASS AND BROWN'S SEED AND PLANT LIST free by post for three penny stamps.

Phlox Drummondi	Nelrembergias
Cupheas, sorts	Ageratums
Scarlet Geraniums, sorts	Lobelias, sorts
Heliotropiums, sorts	Lantanas, sorts
Anagallis, sorts	Groundsels, double purple
	Alonsoa

GERANIUMS, with Scarlet Flowers and beautifully Variegated Leaves, at 12*s.* per dozen, viz.:—Flower of the Day, Mountain of Light, and Bridal Bouquet.

IVY-LEAVED GERANIUMS, with Scarlet Flowers, 12*s.* per dozen.

DAHLIAS, 21*s.* per dozen:—Alice, Attraction, Annie Neville, Annie Salter, Brilliant, Exquisite, Gloire de Paris, Harlequin, Lilac King, Lilliput, Lord Byron, Lord Lyndhurst, Motley, Mrs. James, Queen Victoria, Scarlet King, Sir John Franklyn, Wonderful, Zebra.

The following at 9*s.* per dozen:—Bathonia, Beeswing, Beauty of Kent, Box, Caractacus, Captain Warner, Cardinal, Duke of Wellington, General Fauchier, General Negrier, John Edward, Louis de France, Magnificent (Edwards'), Magnificent (Keyne's), Madame Gaubert, Princess Louisa, Queen of England, Queen of Primroses.

Older Varieties, 6*s.* per dozen.

Also, AGRICULTURAL AND GARDEN SEEDS of every description.

Price Lists of Plants and Seeds sent post free, on application.

J. COLE begs respectfully to inform the Floricultural Public that he has some very fine Shrubby Bedding CALCEOLARIAS to offer them, namely, PRINCE OF ORANGE and ERECTUM. The former a dark orange with a large umbel of flowers nearly as large as "Kentish Hero;" the latter an orange with a scarlet tinge, of erect habit, similar to "Viscossima," with much larger flowers. J. C. flatters himself they will give the greatest satisfaction to all purchasers, being entirely shrubby and free from that coarseness of foliage many of the varieties evince. "Prince of Orange" is of dwarf habit, with small green glossy foliage, and never infested with green-fly, which is a great acquisition in the Calceolaria. J. C. offers them at 5*s.* per plant. The usual discount when three are taken. Flowers of them were submitted to some of the leading London nurserymen, who wished to have plants when sent out. A remittance solicited from unknown correspondents.

Keyfield Nursery, St. Albans, Herts.

SUPERB LATE WHITE BROCCOLI—"EMPEROR."

EDMUND PHILIP DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletson, Market Gardeners, Thorngumbald, near Hull, begs to announce that he is prepared to send it out in sealed packets at 2*s.* 6*d.* each. This Broccoli has been raised by the Messrs. Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. It is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower, and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

May be had of Messrs. NOBLE, COOPER, & BOLTON, 152, Fleet Street; and Messrs. HURST & M'MULLEN, 6, Leadenhall Street, London; also of the Advertiser, 57, Queen Street, Hull.

NEW TURNIP SEED.

TO THE TRADE.—NEW TURNIP SEED.—*The Subscribers having a few Bushels more than they require for their regular Trade, can offer the following varieties, grown by Farmers of the highest respectability, and warranted all* NEAT *as delivered by them.*

GREEN-TOP SCOTCH YELLOW TURNIP.
PURPLE-TOP ABERDEEN "
GREEN GLOBE "
WHITE GLOBE "

The have also a few hundred weight of the following Mangold Wurzel, &c., also saved by farmers:—

YELLOW GLOBE MANGOLD WURZEL.
LONG RED " "
RED GLOBE " "
WHITE BELGIAN CARROT.

As the quantity is small, an early application is requested. Wholesale Catalogues can be had on application in exchange for one penny stamp.

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

RENDLE'S PRICE CURRENT.—Opinion of the Editor of the *Illustrated London News*. See *Illustrated London News*, March 18, 1854.

"This is a scientific catalogue of the Seeds of Garden Plants by Mr. Rendle, of Plymouth, the eminent Nurseryman. The Pamphlet will be very suggestive to all who are fond of a garden, as it contains not only a classified list of every necessary or ornamental Garden Seed, but also the fullest description of the plants, and the mode of cultivating them. We rarely find so much information in so small a compass."

STANDISH AND NOBLE, NURSERYMEN, SEEDSMEN, &c., Bagshot, Surrey, are now prepared to receive orders for the following new and beautiful varieties of AZALEAS, which will be ready for delivery in June next. The Advertisers can recommend them with the greatest confidence, as superior to any others of their kind.

AZALEA BEALII.—This very distinct variety was introduced by them from China. The flowers, which are of first-rate shape, are quite unique, being striped, like a Carnation, with rich vermilion on a pure white ground. It is of good habit, fine in foliage, and a most abundant bloomer; and although decidedly in the first rank as a greenhouse plant, it is quite hardy enough for the open border. Each, 21*s.*

AZALEA CRISPIFLORA, a species differing much from any other known Azalea, having a character entirely its own. No other kind approaches it in compactness of habit, and its foliage is very fine, abundant, and evergreen. The flowers are very large, and the edges of the petals have the appearance of being irregularly *gaufred*, like a lady's frill; the colour is a rich rose lake. From the fact of its blooming very late—much later than any other Azalea—it will be doubly valuable for many purposes. Each 21*s.*

EUGENIA UGNI, a very fine new Myrtaceous plant, recently received by the Subscribers from Mr. Bridges, of Valparaiso, will prove hardy in most parts of Great Britain. It is figured in the January number of Curtis's "Botanical Magazine," and Sir William Hooker describes it as forming a charming Evergreen Shrub, the flowers and leaves of which are fragrant. This peculiarity alone would be sufficient to ensure its general cultivation, independent of its merits as an ornamental shrub of easy culture. Small established plants 21*s.* each. No discount unless three are ordered.

LAPAGERIA ROSEA; young plants in a growing state, 31*s.* 6*d.* each.

AZALEA INDICA (Beauté de l'Europe).—A new variegated variety of great merit—received a First Class Certificate at the National Floricultural Society, also at the Exhibition of the Society of Horticulture, of the Seine, held at Paris in March, 1853. It is one of the most abundant flowering Azaleas in cultivation. Price 7*s.* 6*d.*

BORONIA DRUMMONDI.—In the style of B. pinnata; colour, beautiful rosy crimson. Unlike other species of this genera, that now offered is of extremely easy culture, elegant habit, and will undoubtedly prove the finest greenhouse plant suitable for exhibition purposes that has been introduced to this country since the Subscribers offered for the first time Pimelea spectabilis. Price 7*s.* 6*d.* each. From the last three Plants usual discount will be allowed to the trade.

HUGH LOW & CO., Clapton Nursery, near London.

TURNIP SEEDS.—The Subscribers are now selling from a large and carefully selected Stock, the following varieties of TURNIP SEEDS. Prices are moderate.

SWEDES.—Skirving's Purple Top. On strong clays or other heavy soils no variety of Swede will produce so bulky a crop as this.—Lothian Purple Top: an established well-known sort; rounder shape than Skirving's, and does not grow so much to "long necks."—Hardy Green Top. There is nothing to equal this variety for mellow or peaty soils; it is less liable to rot than any other Swede, and it possesses excellent feeding properties, being crisp, juicy, and sweet.—Laing's Improved. A beautiful shaped bulb, and on rich loamy soils yields a good crop, but is not equal in hardiness to any of the preceding.

YELLOWS.—Green Top, or Aberdeen Bullock—Improved Stock. It is questionable if there be a better Yellow Turnip than this, provided it be grown from a properly selected stock; it has, however, above all others, in too many instances, disappointed the farmer, in consequence of the spurious character it has assumed through a bad stock of seed, which, instead of giving a heavy crop of large well shaped bulbs, with moderate sized tops, produce only stunted small bulbs with a profusion of large coarse tops.—Improved Purple Top Aberdeen—Skirving's variety. A very superior sort, yielding a heavy crop, but is not considered equal in hardiness to the preceding.—Dale's Hybrid. This variety yields a very bulky crop, and is a first-rate kind for early winter consumption. From the bulbs growing considerably out of the ground it is well adapted for sheep feeding.—Improved Early. A superior sort; bulbs large and finely shaped, with small top and tap root. Unless wanted for early autumn use it should not be sown till the end of June, and sowing may be continued up to the middle of July, with the certainty of having a good crop.

WHITES.—Large Globe, Green Globe (the stocks of these are extra good)—Red Globe.

Priced Lists of the above, with every other description of Farm Seeds, may be had on application, post free.

All parcels of Seeds are delivered carriage free to the principal Railway Stations and Shipping Ports throughout the kingdom.

W. DRUMMOND & SONS, Seedsmen, Stirling, N. B.

TRUE BLUE ORKNEY POTATOES.

DIRECT FROM ORKNEY, MAY BE HAD FROM

WM. HAMILTON, SEEDSMAN, &c., 41, Margaret Street, Cavendish Square, London, price 3*s.* per peck, or 10*s.* per bushel.

The qualities of the above Potato are most excellent in every respect. It boils mealy, and has a fine flavour, is very hardy and most prolific, and of good size in almost any soil.

W. H. had a few of these Potatoes two years ago, and from the trial he has given them, and the very flattering accounts he has had of them from *all* the correspondents who were supplied with them, he can particularly recommend them as a most valuable Potato; AND HE WARRANTS THEM FROM ORKNEY, THUS SECURING ANY BENEFICIAL RESULT WHICH MAY ACCRUE FROM A COMPLETE CHANGE OF SOIL.

W. H. begs to inform those who may favour him with their orders for VEGETABLE OR FLOWER SEEDS, that he will ensure their being supplied of the best quality; as also BEDDING PLANTS strong, and well rooted. Descriptive Catalogues with prices, may be had on application.

Canvas for Shading Frames, Greenhouses, &c., 4*d.* per square yard.

FLORAL NURSERY, ACTON ROAD, TURNHAM GREEN.

JNO. WESTWOOD has now on Sale, at the above Nursery, upwards of 60,000 FINE HEALTHY GERANIUMS AND FANCY GERANIUMS, including almost every variety, grown at very reduced prices; also, an immense Stock of Verbenas, Heliotropes, Petunias, Scarlet and other Bedding Geraniums, comprising all the newest and best sorts. The trade will be treated liberally.—April 8.

POMPONE CHRYSANTHEMUMS, SPLENDID MIMULUS, AND SEEDLING HERBACEOUS CALCEOLARIAS.

JOHN WESTWOOD, having a large Stock of all the leading Pompone Chrysanthemums (including those recommended by Mr. Robinson in the "Florist" of January last), is prepared to send out well established plants, at 9*s.* per dozen. Also several thousands of Mimulus, raised from the seed of the finest plants in the trade of 1853, at 9*s.* and 12*s.* per dozen; and an equally large Stock of Seedling Herbaceous Calceolarias from the seed of plants, raised by the Rev. E. Simmer, finer than any hitherto exhibited.

J. W. can also supply any quantity of first-rate Bedding Plants, including Shrubby Calceolarias, of all the best kinds, of which he has on hand upwards of 20,000.

A General Catalogue may now be had on application.

The Floral Nursery, Acton Road, Turnham Green.

SEEDS TO IRELAND.—*Plymouth is admirably situated for supplying our sister country with some English Seeds. The Subscribers can refer to some of the leading families in Ireland, who have for many years obtained the whole of their supplies of Garden and Farm Seeds. Seeds delivered free to many of the Irish ports. See Price Current.*

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

ERICA VENTRICOSA SUPERBA, bushy plants, in 48s and 60s, finely set with flower-buds. We particularly recommend these to the trade, at 60*s.* and 75*s.* per 100.

ERICAS.—Fine bushy blooming plants, in large 48s, of the following sorts, at 12*s.* per dozen varieties, viz.:—*Aggregata, Bowei, *Coventryana, *Cavendishi, colorans, *densa, *daphnoidea, echiflora, *exsurgens coccinea, *hyacinthoides, *Linnæoides nova, lævis alba, mirabilis, mammosa, metulæflora bicolor, *nigrita, *ovata, pyriformis, perspicua nana, *rubens, rubra calyx, trossula, transparens nova, Westcoti, *Wilmorea superba, viridiflora, *ventricosa breviflora, *v. Bothwelli, *v. coruscans, v. carnea, v. dependens coccinea, *v. fasciculata rosea, *v. f. longiflora, *v. f. superba, *v. hirsuta, *v. perspicuoides, *v. superba, *v. tenuiflora, *v. tumida.

ERICAS, in small and large 60s, nice bushy plants, many of them set for flower. All the above named marked with an asterisk, as well as the following, at 9*s.* per dozen varieties, viz.:—Denticulata moschata, elata, hyemalis, hybrida, scabriuscula, Sindryana, trossula rubra, umbellata, verticillata, ventricosa, cintra rubra, v. densa carnea, graciliis.

EPACRIS.—The following choice varieties, in 48s, well set for bloom, at 12*s.* per doz. varieties, viz.:—Ardentissima, Atleeana, campanulata alba, c. grandiflora, c. maxima, Copelandica, carnea, coruscans, densiflora incarnata, elegantissima, formosa, grandiflora, impressa, imp. alba, imp. magna, lineatus magnifica, miniata, nivalis, onosmæflora, pulchella major, purpurescens, sanguinea, Tauntoniensis, the Bride, variabilis.

TETRATHECA ERICIFOLIA.—A neat evergreen low bushy shrub, of glossy green foliage, flowering profusely at the end of every branch, flowers the size of a sixpence, delicately perfumed, of a light shade of lilac. Small, 1*s.* 6*d.* each.

YOUELL & Co., Royal Nursery, Great Yarmouth.

General Priced Catalogues free upon application.

In addition to our great experience, the port of Southampton affords us unrivalled facility for the almost daily shipment of SEEDS to all parts of the world; and as no greater test of gennineness and vitality than a long transit by sea can be applied to Seeds, we yield priority to none in supplying such for home growth as cannot fail to prove most satisfactory.

All parties desirous of taking or sending Seeds to the Peninsula, Mediterranean, East and West Indies, Australia, Brazil, Cape of Good Hope, China, America, &c., are particularly requested to state their wishes to us, whereby the annoyance and disappointment which too frequently happens by placing their orders in the hands of inexperienced persons will be prevented. We are continually receiving the warmest thanks of our consignees; only a few days since, a gentleman writes from Melbourne, "Your Seeds have proved excellent. The selection of Peas has afforded us the greatest delicacy in Australia." From Capt. H. J. Barr, Secretary to the Horticultural Society of Bombay: "*Gentlemen,—In acknowledging the receipt of your last supply of Vegetable and Flower Seeds, which reached me on the 8th of June by the overland route, I have the honour to inform you that they have all turned out so fresh and good that the demands on our Society have increased so much that I must now cancel my former order, and beg you to supply me according to the list now furnished.*"

PAGE & CO.'S BLIGHT COMPOSITION should be in the hands of all Plant and Fruit Cultivators. For testimonials see back leaf of *Gardeners' Chronicle*, March 11.

HARTLEY'S PATENT ROUGH PLATE GLASS, for Conservatories, Public Buildings, Manufactories, Skylights, &c.

JAMES PHILLIPS AND CO., Horticultural Glass Warehouse, 116, Bishopsgate Street Without, London.

HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

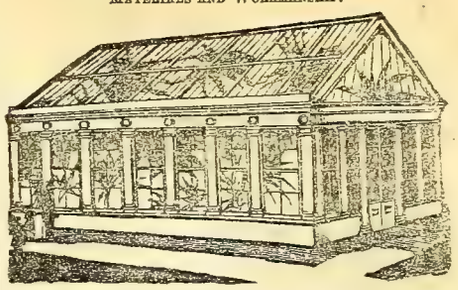
The splendid collections of Stove and Greenhouse Plants, are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



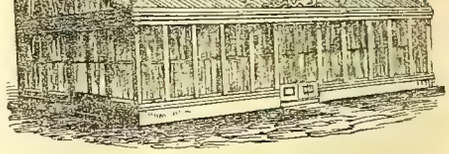
GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

GREEN AND HOTHOUSES made by machinery at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Warranted of best materials; being made by steam-power, they are put together in a superior manner; one trial will prove these Buildings to be the cheapest and best made in England. 1¼ in. Greenhouse lights at 3½*d.* per foot; 2 in. at 4½*d.* per foot. Lists of Prices by enclosing two postage stamps.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS, FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.



JAMES WATTS, HOTHOUSE BUILDER, 8, Claremont Place, Old Kent Road, London.

Green and Hothouses, 9, 10, 11, 12, 13, and 14 feet wide, any length, from 16 to 100 feet. Frames and Lights for Pits, 6 ft. 6 in. 7 ft., 7 ft. 6 in., 8 ft., and 8 ft. 6 in. wide, any length, from 12 to 100 feet. Upwards of 200 Cucumber and Melon Boxes and Lights, from 4 ft. by 3 to 10 ft. 6 in. by 5 ft. 6 in., kept ready glazed with stout sheet glass, painted four times, complete, ready for immediate use, all made of best material, packed and sent to all parts of the kingdom.—Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

BY HER MAJESTY'S ROYAL LETTERS PATENT

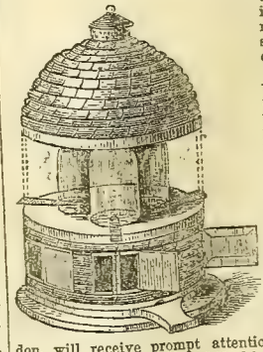
E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

BEEHIVES.

NEIGHBOUR'S IMPROVED COTTAGE BEE-HIVE, as originally introduced by GEORGE NEIGHBOUR & SONS, with all the recent improvements, glasses, thermometer, &c., price 35*s.*, securely packed for the country.



This unique hive has met with universal commendation, and may be worked with safety, humanity, and profit, by the most timid; its arrangements are so perfect, that the honey may be taken at any time of the gathering season without at all injuring the bees, the produce being of crystal purity. The public are hereby cautioned against a piracy of this Beehive.

Early applications, addressed to GEO. NEIGHBOUR & SONS, 127, High Holborn, or 149, Regent Street, London, will receive prompt attention. Their newly arranged Catalogue of other improved Beehives, with Drawings and Prices, sent on receipt of two stamps.

SUTTON'S PERMANENT GRASS SEEDS,

Price 24s. to 30s. per Acre.

GENTLEMEN intending to lay down LAND to PERMANENT PASTURE, or for one or two years lay, are recommended to communicate with us, stating the nature of the soil and situation, that we may advise as to sorts of Grass Seeds most suitable. Having had many years' experience in laying down Land to Permanent Pasture in almost every part of the Kingdom, we can confidently undertake to supply the sorts of Seeds best adapted to the land to be laid down.

EXTRACTS FROM LETTERS TO MESSRS. SUTTON.

It may appear superfluous that we should publish anything in the way of testimonial; we will, however, quote the following from among many other letters now before us:—

From Mr. Dowdeswell, Steward to R. B. Sheridan, Esq., Frampton Court, October 22, 1853.

"The Grass Seeds have turned out uncommonly well this season, and we have some very fine crops of Turnips, Swedes, and Mangold Wurzel."

From the Rev. Joseph Gibbs, Clifton Hampton, Nov. 25, 1852.

"The Pasture made with your seed is every year improving, and getting more Clover in it, which is more than I expected, as the land hereabouts is not calculated to grow good natural Grass."

From Professor Lindley, Horticultural Society, 21, *Regent Street, London, November* 9, 1853.

"We have already made trial of your Grass Seeds, and it is only justice to say that they have proved the best we have sown for many years."

From the Rev. J. Lawson Sisson, Edingthorpe Rectory, North Walsham, November 2, 1852.

"I have one piece of land, sown last May with your Permanent Grass Seeds, and no one can possibly tell it from an old meadow, save in the absence of weeds. I have had a great deal of feed from it also."

From William A. Commerell, Esq., Strood Park, Nov. 13, 1852.

"I beg to forward a cheque for the Grass Seeds supplied by you, and am glad to be able to bear witness to their quality, having found them so very superior to what I have generally obtained."

From Mark Philips, Esq., Snitterfield, Stratford-on-Avon, November 16, 1852.

"The Permanent Grass Seeds supplied me last spring are remarkably strong and healthy."

The Rev. Joshua Bennett, Caverson Parsonage.

"In less than three months it has presented a most luxuriant herbage, forming a striking contrast to the self-sown turf around it."

From P. Fusey, Esq., Pusey, February 11, 1850.

"I was particularly pleased with your Grass Seeds, which I employed for laying down fresh broke land. It became a close, fine sward, by August."

From the Rev. A. Huxtable, November 19, 1852.

"Mr. Huxtable has the pleasure of acquainting Messrs. Sutton that their Grass Seeds of 1851 have turned out admirably."

From the Rev. Mr. Wingfield, Gulval Vicarage, Penzance, November 15, 1852.

"My pasture laid down with seeds from you in March, 1851, is in a very luxuriant state, and in every way satisfactory. The Clover Seed also, sent during the present year, have grown admirably."

From R. Tull, Esq., Crookham House, near Newbury, November 19, 1852.

"The Grass Seeds sent in the spring to sow for a pasture grew remarkably well, and the present appearance of the pasture is most satisfactory."

From N. Manby Power, Esq., the Hill Court, Ross, Herefordshire, April 2, 1853.

"The Grass Seed sent has answered very well, and is almost a sward already."

From Rev. J. W. Knipe, Woodford Rectory, Dorset, February 16, 1853.

"The Grass Seed I had in the spring has given very great satisfaction."

From Rev. Robert Hawthorn, Stapleford Lodge, near Cambridge, October 31, 1853.

"I was very much pleased with the Grass Seeds which you sent me; the Grass sprang up quickly and covered the field well."

From the Rev. Jerome Clapp, Odem House, Appledore, Devon.

"Allow me to say that the Grass Seeds you sent me have fully realised my highest expectations."

From Mr. C. Judd, Gardener to his Grace the Archbishop of Canterbury.

"The Grass Seeds received from you succeeded admirably, and, although sown late, the growth was such that we were enabled to mow the Churchyard in the autumn, and it has now the appearance of an established lawn of some years' standing; and my employer, the Archbishop of Canterbury, is quite satisfied with its appearance."

SUTTON & SONS, Seed Growers, Reading, Berks, *having made the cultivation of Natural and Artificial Grasses the subject of their especial attention for many years, have much satisfaction in receiving (besides very many others), the above communications quite unsolicited.*

Clovers and Grasses for One, Two, or Three Years' Lay, 14s., 18s., and 22s. per Acre.

A Priced List of Mangold Wurzel, Turnips, and other Agricultural Seeds may be had post free on application, addressed

JOHN SUTTON & SONS, SEED GROWERS, READING, BERKS.

CAPE HEATHS.

W. J. EPPS begs to call attention to his extensive and rare Collection of Heaths, which are in the finest condition possible; very bushy and well formed for specimens in 3, 4, and 6-inch pots, consisting of all the best varieties, such as Aristata ampullacea, tricolor, jasminiflora, ventricosa, Massoni, Webbiana, obbata, &c., &c., 12*s.*, 18*s.*, and 21*s.* per doz. A Collection of 100 varieties, 5*l.*, carriage paid to London. A liberal allowance to the Trade, provided a quantity be taken. All the new and best kinds of Azaleas, Stove and Greenhouse Plants, Fuchsias, Dahlias, Verbenas, and Roses, equally moderate.

W. J. E. has about 200 young specimens of Heath, &c., to part with in S, 11, and 20-inch pots. Also a Collection of very beautiful Orchids. Lists sent on application.

Nurseries, Maidstone and Ashford.

MAY'S PARAGON CABBAGE.

THE Subscriber, in offering the above for the first time, guarantees it to be the finest Cabbage in existence; of dwarf habit; has never been known to run; attains a large size (having been grown to the great weight of 28lbs.); of a most beautiful green, and boils tender as Asparagus, which it continues to do throughout the season; in flavour is as far superior to the ordinary Cabbages of the day as they are to the old Drumhead Scotch. In ½ oz. packets, 1*s.* each, free by post. The usual allowance to the trade.

H. M. begs to inform the public that he is unable to supply any more of his MAGNUM BONUM LETTUCE, as the stock was only small and is completely sold out.

Address all orders and communications to HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

TO DAHLIA GROWERS.—EDWIN HARRISON (PERRY'S), is the most brilliant crimson Dahlia ever raised; build and form of General Fauchier, and more constant than any crimson Dahlia in cultivation. No grower can be without it; as an ornamental plant it has no rival. It has obtained one first-class Certificate and three first Prizes as the best crimson Dahlia, beating all other varieties. Plants in May, 10*s.* 6*d.* each.

ALEXANDER POPE (PERRY'S), is a constant well-formed Dahlia, with very high centre; colour pale lemon. It has obtained one first-class Certificate and two first Prizes as the best yellow or buff Dahlia. The *Gardeners' Chronicle* says—"We like the flower much for its novelty." Plants in May, 7*s.* 6*d.*

Early orders are solicited, as the stock is small.—HENRY POPE, Gib Heath, near Birmingham.

BALSAM SEED.—Mr. GLENNY has none but mixtures left, but they contain all the varieties; 60 seeds for 13 stamps.

DAHLIA SEED.—A few sealed packets of 100 seeds from 12 first-rate flowers, grown by themselves, 30 stamps. Mr. GLENNY engages to procure all the subjects recommended in his Almanac, if they are to be had at all; letters only attended to.—420, Strand.

FLOWER SEEDS.—We have selected out of our large collection of Flower Seeds the most beautiful and showy varieties, each sort distinct in colour, and calculated to produce a fine effect when planted out in beds or groups in the flower border; and we have had each variety distinctly marked with its Botanical and English name, height, time of flowering, colour of the flower, manner of growing, whether erect or trailing, &c., the time it should be sown, and other valuable hints as to its cultivation. In selecting these varieties, we have been careful to exclude all which are shy bloomers, or have an insignificant appearance, so that the collections will comprise only those which are really showy and handsome, and which we believe would prove to the entire satisfaction of any lady or gentleman who might be disposed to order them. The German Stocks and Asters especially are most superb. The Collections will be sent free by post to any part of the kingdom at the following prices:—

Twenty extra fine varieties, all distinct and beautiful, 5*s.*
Fifty ditto ditto 10*s.* 6*d.*

Payment can be made either by Postage Stamps or Post Office Order, made payable to J. C. WHEELER AND SONS, Nurserymen, Gloucester.

SEED POTATOES.

JOSEPH WILSON, SEED POTATO MERCHANT, Ipswich, Suffolk, begs to inform Seedsmen and Growers that he has on hand the following Stocks, which are not excelled by any other now in the market:—

Early Ashleaf	10*s.*	0*d.*	per bushel
„ Shaws	7	0	„
Thompson's Seedlings, new stock, an improvement of the Shaw	8	0	„
Fortyfold	7	0	„
Pink Kidney	7	0	„

The Advertiser would remind correspondents that all letters of inquiry should contain a stamped envelope for reply. Orders for 6 bushels and upwards will be carriage paid to London, and no order whatever will be attended to unless accompanied with a remittance.

SELECT FLOWER SEEDS.—POST FREE.

Marigolds, finest double dark French.	Aster, Reine Marguerite (the best variety in cultivation).
Do. do. striped Unique French.	Saponaria calabrica, var multiflora.
Do. do. true dwarf French.	Eschscholtzia californica alba.
Do. do. new dark Pigmy.	Nemesia versicolor.
Do. do. new yellow Pigmy.	Cenia turbinata.
Do. do. double orange African.	Mignonette, new large variety.
Do. do. double lemon African.	

The above MARIGOLDS are well known in the locality, having obtained First Class Awards at several Provincial Exhibitions; all own saved from carefully selected double flowers, and can be recommended with confidence. In packets of about 1000 seeds each. The Marigolds separately, 3*s.*; the whole collection of 13 packets, 5*s.*

Collections of all the most approved Annuals (own growth) 60 packets, 10*s.*; 30 do. 5*s.*; 15 do. 2*s.* 6*d.*, in descriptive and cultural labels. Catalogues may be had on application.

JOHN SLATER, The Nurseries, Malton, Yorkshire.

NEW AND CHOICE PANSIES.

National (Turner)	Marchioness of Bath.
France Cycole.	Adela (Turner.)
Constance (Turner)	Albion (Thomson.)
Sir J. Paxton (do.)	Almanzor (do.)
Queen of England (do.)	Criterion (do.)
Alfred the Great (do.)	Caroline (do.)
Mr. Beck (do.)	Sultan (Hooper)
Sir P. Sydney (do.)	Lucidum (do.)
Mrs. Beck (do.)	Commander-in-Chief.
Polyphemus (Thomson)	Lady Walsingham.
Elegant (do.)	Elegantissima.
Eva (do.)	Blanche.

The above set, 20*s.* Post-office orders payable at Guildford.
Good named varieties, 6*s.* per dozen.
HART AND NICKLIN, Guildford, Surrey.

FIRST-CLASS NEW VERBENAS, FUCHSIAS, GERANIUMS, ROSES, PANSIES, &c.

CHARLES H. GARDINER offers the undernamed, in strong plants, at the following prices, hamper and packing included.

VERBENA JESSIE, large, white, with purple centre, extra large truss, fine form, good for bedding or exhibition; strong plants, 5*s.* each. Choice and new kinds of 1853, 9*s.* per dozen.

FUCHSIAS.—Selections from the following choice and new kinds, strong plants, 12*s.* per dozen:—Glory, Incomparable, King Charming, Model, Dr. Lindley, England's Glory, Beauty of Clapton, Premier, Commodore, Nil desperandum, Duchess of Lancaster, Ariel, Mrs. Pattersen, Perfection, Lady Franklin, Lady Cavendish.

BEDDING GERANIUMS.—Hendersonii, Boule de Neige, White Unique, Lilac ditto, Shrubland Pet, Bagshot Park, Mrs. Rickett's—fine scarlet with white eye, very dark horse-shoe leaf—strong plants, 9*s.* per dozen.

PANSIES.—Choice and best kinds, 9*s.* per dozen.

TEA ROSES.—Strong plants in pots, of the best kinds, 12*s.* per dozen.—Fant Nursery, Maidstone.

RENDLE'S IMPROVED SWEDE TURNIP.—*The Stock of this excellent Swede has been grown for us this season by R. H. Watson, Esq., Dorsley, near Totnes. It is a most hardy and valuable variety. Price* 1*s.* 6*d. per lb. For further particulars and testimonials of its excellence see* "FARMING PRICE CURRENT," to be procured from

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

MORTON'S YELLOW GLOBE MANGOLD WURZEL, *saved by Thomas Bennett, Esq., Gloucester, from the Stock originally grown by J. C. Morton, Esq., the Editor of the Agricultural Gazette.*

Seed of this most excellent variety can now be obtained from WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth, who have purchased the whole of the Stock.

NORTH DEVON EVERGREEN RYE GRASS.—*This Grass, which is held in great celebrity in the West of England, should be introduced into every mixture—for* PERMANENT PASTURE.

It is a very hardy Grass, and remains evergreen throughout the most severe winter. It forms a fine bottom, and is much liked by cattle. The true sort can be had from

WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

Price from 5*s.* to 6*s.* per bushel, or 4*d.* per lb.

This Grass can be recommended with the greatest confidence.

HUGH LOW AND CO. would invite inspection of their large and healthy stock of SOFT-WOODED PLANTS, suitable for Flower Garden decoration, amongst which they would more especially enumerate the under-named. The plants are all established in small pots well adapted for packing. Prices moderate, and purchasers of large quantities will be treated with great liberality. Calceolarias, shrubby and herbaceous; Coleus Blumeii, variegated foliage; Ageratum cælestinum and variegatum; Fuchsias in all the leading varieties; Verbenas, do.; Chrysanthemums, do.; Phloxes, do. Scarlet and variegated Geraniums; Lantanas in many varieties; Pentstemons, do.; Petunias, do.; Lophospermums, do.; Maurandyas, do.; Mimulus, do.; Lobelias (tall and dwarf), do.; Antirrhinums, do.; Heliotropes, do.; Salvias, do. Double Crimson Rocket, Pentstemon purpureum hybridum, superior to all other varieties of P. gentianoides; Cheiranthus Delileanus; Pyrethrum grandiflorum plenum.—Clapton Nursery, London.

NEW FUCHSIAS OF 1854, raised by Mr. Batten, who sent out Fuchsia Clapton Hero, which gave universal satisfaction.

MR. CHARLES PALMER, scarlet corolla, white tube, broad inverted sepals, fine habit; 7*s.* 6*d.*

GRANDISSIMA, deep claret corolla, long white tube, good habit, 7*s.* 6*d.*

ADMIRAL, light crimson corolla, light tube, and a free bloomer, 7*s.* 6*d.*

Oxalis, new species from Chili, very large, bright rose-coloured flowers, and an abundant bloomer, 30*s.* per dozen.

Tropæolum azureum, large sound roots, 30*s.* per dozen.
„ tricolorum „ „ 15*s.* „
„ brachyceras „ „ 15*s.* „

The usual discount to the Trade.

HUGH LOW AND CO., Clapton Nursery, London.

PAGE AND CO.'S

BLIGHT COMPOSITION should be in the hands of all Plant and Fruit Cultivators. 4*s.* per gallon, sufficient to make four. For testimonials see back leaf *Gardeners' Chronicle*, March 11, 1854.

GARDEN AND AGRICULTURAL SEEDS, first quality, and lowest market price.

Oxford Street (adjoining Radley's Hotel, 20 yards from the Railway and Docks), Southampton.

The Gardeners' Chronicle.

SATURDAY, APRIL 8, 1854.

THE Honourable GRANTLEY F. BERKELEY, brother of Earl FITZHARDINGE, acquaints the world* that he has found out what ails the POTATO; and, to use his own impressive words, he has, "by a series of annual experiments, established the mode of culture that perfects its cure." The Potato has been attacked by a fever; that is the whole secret; it caught it from "guano or foreign manures;" the symptoms were aggravated by "an attempt to impose on the public a manufacture sold for, and in imitation of, guano;" added to which, if we take into account "all sorts of chemical inventions," "we need not open a wider door to conjecture as to what new disease, through exhalation, might or might not have been engendered." There is really no escape from Mr. GRANTLEY BERKELEY'S conviction that the disease is a *feverish epidemic.* His reasoning is conclusive.

That point established, the next object was to cure the feverish epidemic. At first the noble experimentalist "followed up the entomological idea," but succeeded in realising nothing beyond "*a remarkable hint.*" We don't quite see the connection between the hint and the grand discovery—but that is immaterial—a discovery was made. This consisted in finding out that Potatoes without manure are more free from disease than those which are "enriched." So, in order to abate the fever, manure was sparingly applied in a form "easily soluble to the earth;" this was done, we are told, "to rally, as it were, the pulses of nature"—that is, we presume, the pulses of the Potato. By strict attention to this process, we are assured that one pound sterling was netted off the Potato ground. The noble author's figures are not quite so clear as his philosophy; but we understand him to say that, in making out a profit of 20*s.* an acre, he does not reckon manure, because it costs him nothing; nor does he consider

* The Potato Disease, its origin, nature, and cure; in a Letter to the Earl of DERBY. By the Hon. G. F. BERKELEY. LONGMANS.

that any labour should be included in the account, except additional labour and horse hire.

Let us hope that these discoveries will be appreciated, and that the world will be sensible of the inestimable value of noble authorship. We are at least sure that those who had the honour to preside over Mr. Grantley Berkeley's education will contemplate his discoveries, his erudition, and his philosophical spirit with that pride which all tutors must feel when a distinguished student stands revealed as a still more distinguished man.

Some months since attention was drawn in our columns to an observation by Mr. Lawes of Rothamsted, that the small rain gauges in use among meteorological observers do not indicate the amount of rain which really falls upon a given area; but a considerably smaller amount. We have now before us the following results, obtained by this excellent experimentalist during an entire year, and they entirely confirm his anticipations. The same conclusion has, we understand, been arrived at in the Paris Observatory.

Rain obtained at Rothamsted from a large gauge having an area of 43½ feet=1-1000 of an acre, and from one of the ordinary size.

	Actual weight of Rain from large gauge.	Inches calculated from weight in large gauge.	Inches of Rain from small gauge.	Large gauge exceeds small.	No. of Days Rain by large gauge.	No. of Days Rain by small gauge.

Hence it appears that the indications by the small gauge are not only more than 5¼ inches too low in one year, but that even the number of rainy days is not correctly given, for the large gauge indicates 249, and the small gauge only 150.

We refrain for the present from making any remarks upon this subject: but we shall not fail to return to it on some future occasion.

In a former article on the Cedar of the Ancients, it was shown that the term was employed in a general sense, and not restricted to a single species, much, indeed, as the term is used in the present day, since it includes the Cedar of Lebanon and the pencil Cedar of the new world, as well as other trees which have nothing to do with the Coniferæ; usually from some general resemblance in their wood to what are now considered to be the characteristics of Cedar wood. Indeed, we might say that it was a very general practice among the ancients to apply the names of plants and drugs in a general rather than in a specific sense, as in the case of Kedros and Cedrus; so under the name of Hellebore they included the root of the plant now called Helleborus officinalis, while their white Hellebore was Veratrum album, the roots of both plants being very similar in properties. Their lesser Centaury, again, was one of the Gentianeæ, and their greater Centaury one of the Compositæ. Under the term Cedrus both Pines and Junipers were included, and probably sometimes the Cypress also. Indeed the earlier botanists treated of Pines under the head of Cedrus conifera, and of Junipers under Cedrus baccifera. The ancients were, however, well acquainted with the properties of their several woods, that of the Pines being used for shipbuilding, and the trees known to yield resin. The Cypress was distinguished as an evergreen, for its long life, and for its incorruptible wood. The statue of Jupiter in the Capitol, and the doors of the Temple of Diana, at Ephesus, were both made of Cypress wood. The former after 600, and the latter after 400 years, were said to have displayed no symptoms of decay. In the east it is planted in Mahommedan cemeteries, and probably for the above reason is called "the tree of life." The Juniper woods seem to have been more frequently referred to by the name of Cedar, and used for some domestic purpose, as well as burnt on their altars, when sacrificing to their gods. The berries were thrown on funeral piles, to protect the departing spirit from evil influences.

Having obtained these general results, we may proceed to ascertain which is the *Cedar wood*, and which the *Cedar tree* of scripture. From the confidence with which some references are made, it might be inferred that in this there could be no difficulty. Yet, if we refer to those who have written expressly on the subject, we find great uncertainty respecting the meaning of the words *Æres* or *Eres*, and *Berosh*, which are translated *Cedar* and *Fir* in the authorised version of the scriptures. Celsius, for instance, considers that the first is a general term for the Pine tribe, and that the latter indicates what we call Cedar of Lebanon; while Rosenmuller, and others, conceive that this tree is referred to under the name Eres, and that Berosh signifies the Cypress. But, it would rather appear that the term *Eres* is used in a general sense, like Cedrus, and *Berosh* may not be more specific. In the first place, the word Æres or Eres seems to be the same as the Arabic *Aruz* or *Arus* and *Orus*, which in Arabic works is given as a synonyme of *Abhul* or the Juniper. Niebuhr says that near Aleppo it refers to a Fir tree, while near Mount Lebanon we hear of its being applied to the Cedar of Lebanon. In Alerce, again, which is evidently a corruption of *al-arus*, or *the* Pine tree, we have it applied to Callitris quadrivalvis, or the Cedar of Mount Atlas, of which the wood was lately shown to be of such excellent quality, and which has been found to have been used in the woodwork of the roof of the mosque, now the cathedral of Cordova.

In the scriptures, wherever we find any natural product mentioned, we may be quite sure that in the localities named something is to be found having the properties and applicable to the uses required for the elucidation of the several passages, and often, indeed, with great similarity of name among the Arabs of the present day. Thus, if we take the Cape plant, the *Asuph* of the Arabs, to be the *esof* or hyssop of scripture, we find it both in Lower Egypt and in the deserts of Arabia, likewise near Jerusalem, and also growing on a wall. So, when the Israelites, while wandering in the desert, are directed to burn *eres* (translated Cedar wood) with hyssop and wood dyed in scarlet, it is evident that they must have been able to obtain some kind of Cedar wood as well as the hyssop. This they might easily have done if they applied the term to the Juniper, growing on the rocky mountains of Sinai, where they could not have obtained the wood of the Cedar of Lebanon. At a later period, as in several passages of Kings and of Chronicles, *eres* (translated *Cedar*) is frequently mentioned. We read of the Cedar trees out of Lebanon, and the uses to which the timber was applied, but nothing so distinctive as to enable us to say that only the Cedar of Lebanon, or the Cypress, or the sharp-leaved Juniper were intended, to the exclusion of the others, for all are found on Mount Lebanon; all were formerly much employed, and all were probably more abundant in ancient times. Perhaps, also, some of the wood of the Alerce might have been obtained by the Phœnicians from Africa and sent with the Cedar from Lebanon. But as the wood of the Cedar of Lebanon is sufficiently good for many purposes, there is no reason why it should not have been included with the others, though not to their exclusion, and may thus have obtained a character for its wood which was due to the others. But it certainly seems to be alone alluded to in Ezekiel ch. xxxi., "Behold the Assyrian was a Cedar in Lebanon, with fair branches, and with a shadowy shroud, and of a high stature, and his top was among the thick boughs."

VEGETABLE PATHOLOGY.—No. XIV.

56. The tips of the roots or spongelets consist of delicate cells, whose walls have no particular thickening, and are thereby fitted. like other thin membranes, to imbibe moisture by the action of endosmose. The cells may either be in perfect contact with each other, or intercellular spaces may be left, but if so, these spaces, in most cases, except in particular organs where the cells are in contact by a very small portion of their surface, as in the spongy tissue of the under-side leaves, or the stellate cells of certain kinds of pith, &c., will not communicate with each other, but will constitute little insolated cavities, which, according to circumstances, may either contain air or fluid. It is vain, therefore, to imagine any general imbibition of moisture by capillary attraction, though in a few instances such may possibly take place, the grand moving agent being the reciprocal action of fluids of different densities on opposite sides of an intervening membrane, an action first discovered by Dutrochet, and designated by the terms endosmose and exosmose. Nor is their action confined to inelastic fluids, but is extended to gaseous matters, which are imbibed according to different rates of penetration, as demonstrated by Mitchell.*

57. From the very nature of the case, it is clear that plants can exercise very little choice in the matters which they imbibe, but, in general, injurious substances in solution will enter as freely as those which are not injurious, except they exercise some chemical or mechanical action on the tissue, as in the case of many poisons, which are in consequence rapidly fatal. It appears, however, that owing to some vital action, combined possibly with some laws of rapidity or intensity of penetration, analogous to those which maintain in gaseous bodies, it is certain that plants do in particular cases exercise some degree of choice, or, at least, that certain substances do not enter with the same facility. If a Pea and a grain of Wheat, for instance, are placed in the same soil, the Wheat will absorb silex, while the Pea will absorb none. Dr. Daubeney has also shown that certain plants will not absorb strontian, and Saussure could not make Polygonum Persicaria absorb acetate of lime, though it took up freely muriate of soda.* As a consequence of the very limited choice which plants exercise, they are not only benefited by the addition to the soil of such substances as in due proportions are promotive of health, but they suffer from the presence of matters directly destructive or existing in larger proportions than are requisite for health. For the most part such mineral or vegetable, or even gaseous, poisons as are injurious to man, are equally injurious to plants.† Fungi, however, afford many exceptional cases; for in strong solutions of arsenic and other mineral poisons, the mycelium of moulds will flourish, while the strongest opium affords a matrix for the development of a peculiar fungus, and these are no rare or isolated examples. Tannin, which is peculiarly obnoxious to vegetable life, does not prevent the growth of a Rhizomorpha, on the walls of the tan vats; and Russian leather, though the contrary has been asserted, is by no means exempted from the production of moulds. Though gaseous matters do not prove immediately destructive to vegetation by at once withering the leaves, their absorption by the soil may in the end be equally injurious, a point which ought to be carefully kept in view in those questions respecting chemical works which so often come before juries. During several months of the year their action on the aerial portions of plants is comparatively insignificant, while the absorbing powers of the spongelets are very rarely at rest.

58. Besides the office of imbibing nutritive matter from the soil, the spongelets bear a part in the separation of noxious or superfluous substances from the plant, for there is not only an upward current but a lateral and downward current also, according to the laws of the action of endosmose and exosmose; some of the principles of the plant therefore must mix with the surrounding moisture. It is not to be supposed that this is conducted on purely mechanical or chemical laws, but by a modification of these by vital action. That matter is given out by the roots is proved by the fact that water becomes impregnated with the peculiar qualities of plants whose roots are immersed in it, and by those experiments which show that chemical matters held in solution and absorbed by a portion of the roots of a plant immersed in one vessel will be conveyed by means of another portion of the roots of the same plant into another contiguous vessel. It is probably in consequence of such separation of noxious matter, and not only by reason of the absorption of the constituents peculiarly suited to the individual plants, that successive crops of the same kind will not flourish in the same soil. And as the matters requisite for nutrition must be presented to the plant in proper proportion, within certain reasonable limits, if health is to be maintained, it is clear that the superfluous matter may be returned in such quantities as to be, in addition to any perennial supply, an injurious item in the elements of the question. *M. J. B.*

---

* The dripping of fluid from the divided end of a truncheon in full sap, as from the shoots of the Lianas of South America, is easily explicable without the supposition that, being contained in the intercellular cavities, it obeys the laws of gravity as superior to those of capillary attraction. Whether the ducts, often of considerable size, contain air or sap, is a totally different question. If the latter, it would be discharged very rapidly by mere gravitation. See Gaudichaud, Ann. des Sc. Nat. Sept. 1836.

ACACIAS.

Of the whole class of New Holland plants, few are more interesting than Acacias. The strange variety in the phyllodes or leaves, the profusion and fragrance of their blossoms, and the season of the year when they are in the greatest perfection, render them eminently worthy of cultivation. My object, therefore, in the following remarks is to bring, if possible, this interesting tribe of plants more into notice than ever it yet has been; and with that view, I have sketched or drawn out the more prominent characters of a collection of 25, well adapted for the conservatory border, shelves, or the greenhouse stage; but before I commence my enumeration, permit me to offer a few words common to the generality of those I intend bringing under notice:—First, I have to state that the whole of these Acacias are natives of various parts of New Holland; therefore enjoying a brisk growing climate through the spring months, and a dry atmosphere during summer. And thus we are furnished with two leading points whereon to base the successful cultivation of this genus; these are, to maintain such a condition of climate as will insure a quick growth, and when once that is obtained, nothing is better for ripening it than an exposure to bright sunlight, with a free circulation of air at all times. Second, Acacias generally seed well; and thus propagation is rendered easy, as the seeds germinate freely, either when sown as soon as they are ripe, or kept back until the ensuing spring. In the latter case, they must be soaked in hot water. I have, however, seen seeds which have fallen from cyanophylla and

* These instances are taken from Dr. Lindley's "Theory of Horticulture," of which a new edition is promised.

† Multitudes of instances are recorded in the edition of Dr. Pereira's "Materia Medica," just completed, a work which is beyond all praise, and which ought to be in the hand, not only of every medical practitioner, but of every botanist who is desirous of knowing something more about plants than their mere external or even structural, differences.

other species spring up as plentifully as Sycamore. Another mode of propagation is by means of cuttings placed in sharp sand, and the pots placed on a warm greenhouse shelf for a month or six weeks, and then introduced into a growing temperature of about 70°, taking care to have the cuttings covered with bell-glasses, until roots have been freely emitted; afterwards, pot off singly, and place them again in the same situation, until they have got well established, when nothing more is needed than ordinary attention. The soil most suitable for the Acacia is three-quarters good turfy loam, with the remainder made up of peat and sharp sand. Another point, which I think is not generally known, is that the generality of them, although very gummy, stand the knife well, without appearing to suffer from its effects; at least with some species its application is absolutely necessary, in order to form good specimens, and keep them within bounds.

A. armata.—This is a valuable species, not only on account of the late period at which it flowers, but likewise on account of its large bright yellow flowers, which are produced in profusion, in globular heads, situated on a peduncle 1 inch in length. This kind is best adapted for pots.

A. alata.—In this the stem and phyllodes are all flattened, and every secondary branch is connected with the midrib of the primary one. The phyllodes are so connected as to assume the form of one long narrow phyllode, thickly beset with hairs, and furnished with short spines at intervals on each side. The flowers are all attached in pairs to the midrib of the primary phyllode, and diverging alternately right and left on each side, to the number of about 30, on a phyllode of about 4 inches long. Peduncle about 3-10th inch in length; flower heads globular, pale yellow. This forms a straggling bush, requiring to be upheld with stakes. It is most suitable for conservatory borders.

A. biflora.—This is a delicate but pretty species, and well worth cultivating. Phyllodes triangular, sharp spined, much resembling an Epacris 1-5th inch long. Peduncles about the same length, bearing two very small white flowers. This plant must be kept in a pot, and clear of other plants, and it will require stopping to make it bushy, otherwise it will soon become weak and straggling.

A. cochlearis is neat and compact, and well adapted for large pots and the margins of conservatory borders. Height, 6 feet. Phyllodes 2 inches long, linear, pointed, but not stiff, rather hoary. Flower heads globular, small, produced in pairs, from the axis of the phyllodes. Peduncles 2-5th inch long. This is a plant of rather slow growth, and it requires no pruning.

A. celastrifolia will flower well, even in small pots, but in 13-inch ones it forms a huge bush, loaded so completely with flowers as hardly to render either phyllodes or pot perceptible; phyllodes about 3 inches long, and 1¼ inch wide; branches forming, as it were, a very long panicle, from 30 inches to 3 feet long; flowers whitish, sweet scented. This species is very subject to scale, the best way of clearing which off is to cut it well in after flowering, and not to be sparing of soft soap and water; or, best of all, use Dominy's mixture.

A. cyanophylla.—This forms a splendid object for the centre of a lofty conservatory, growing as it does to a great height, and producing large loose panicles of exquisitely bright yellow flowers, which are large and highly scented. Phyllodes 10 inches long, and 1¼ inch or 1½ inch in diameter, very wavy, unequal sided. This plant, like celastrifolia, requires a periodical cleaning; it also stands pruning well, and it is much improved by it. No one in possession of a large conservatory should be without this desirable species.

A. cygnorum has rather a pendulous habit, its branches being very slender and almost covered with small pinnated leaves, which are composed of three pairs of leaflets, and it is also studded with sharp spines; leaflets 1-6th inch long. Flowers much like rotundifolia, but smaller. This is certainly an excellent Acacia where variety is wanted, and it is admirably adapted for pots.

A. Drummondi.—What is there to be desired in an Acacia that is not to be found in this? Its habit, which is at once neat and compact, and its flowers, which are conspicuous and produced in profusion, at once place it in the first rank. Its leaves are bipinnate, about an inch in length, formed of three pairs of leaflets, from ¾ to 1 inch long, composed of three pairs of pinnules, which are of an oblong shape, 3-10th inch long; and the petiole of both the primary leaves and leaflets is slightly extended. Flower heads oblong, about an inch long, placed on a peduncle, about the same length, produced singly. Every one who only has room enough for one Acacia should endeavour to obtain this one. The best place for it is the conservatory shelf.

A. dependens.—This is adapted for conservatory borders or large pots. It is of an upright growth, of a very dark colour, and has linear phyllodes an inch in length. Spikes of flowers, 1¼ inch long, of a light yellow colour, and not particularly conspicuous. This is a species that can be kept to any shape by means of the knife.

A. diffusa is suitable for pots, but it is loose in character, and requires the use of ligatures to make it assume a nice shape. It makes shoots about 1 foot long in a year, and furnishes them for about 9 inches in length with flowers, which are produced in pairs from a single phyllode, or in fours, fives, or sixes, when a pair or three phyllodes occur close together. Peduncle about 2-5th inch in length; phyllodes linear, 1 inch in length; margins of the phyllodes running into a sharp point at the apex. Well worth cultivation.

A. grandis.—This is one of the neatest and best of the genus for pot culture, forming as it does, by simply stopping it, either a dense bush, or, with a little more attention, a fine pyramidal specimen; grown in the latter form it is certainly extremely ornamental, either on a greenhouse shelf or the margin of a conservatory border. Its leaves are pinnated, about 3-5th inch in length, formed of eight pairs of leaflets, about ¼ inch long; flowers globular, produced from the axil of each leaf, either singly or in pairs; peduncle ½ inch in length. This is a plant that deserves to be in every collection.

A. ixiophylla is not one of the best, but its earliness renders it worthy of cultivation. It is well suited for pot culture, making a very pretty bush under ordinary attention. Its phyllodes are linear, about 1½ inch long; flowers small, globular, produced singly from the axis of the phyllodes. Peduncles 3-5th inch in length.

A. lineata in all its stages makes a fine pot plant, but being of rather weak growth the use of sticks and ligatures is necessary in order to form a nice specimen. A strong plant under ordinary circumstances will make shoots in one year from 20 inches to 2 feet, producing flowers during their entire length, with the exception of an inch or two at the base; flowers in pairs at the base of each phyllode; peduncles 1-5th inch long; flower-heads globular, small, of a bright orange yellow; phyllodes 2-5th inch long, linear, with the upper margin rounded at the apex and forming a point. One of the earliest and best of the Acacias.

A. longiflora major.—This is a neat kind for a small conservatory border; for when in blossom its bright yellow oblong flower-heads render it a most conspicuous object. Phyllodes linear-lanceolate, 4 inches long, and 2-5th inch across at the widest part; flower-heads about 1¼ inch long, sessile, in pairs, diverging right and left from the axils of the phyllodes, and produced for about 8 inches along the branches. Habit, upright, thin of branches, and inclined to become straggling when well flowered. This is a splendid Acacia, but being difficult to propagate there are but few plants of it in the country.

A. lophantha is best suited for the border of a large conservatory, where it is much esteemed, not for the sake of the flowers (for they are produced but sparingly) but for its fine spreading foliage, consisting of leaves 9 inches long and 5 inches wide, formed of 10 pairs of leaflets, and each leaflet composed of from 14 to 20 pairs of pinnules. Pinnules half-an-inch in length, and ⅛ inch wide; flower heads solitary, of an oblong shape, from 1½ inch to 2 inches long, and of a light colour; peduncle about 3 inches long. The knife must not be used for this plant.

A. mucronata.—This species is well adapted for conservatory borders; its phyllodes are 2 inches long, being twice the length of those of dependens; but in all other respects they are similar.

A. nigricans has much the appearance of grandis, but close inspection will at once show the difference, for instead of 8 pair of leaflets constituting a leaf, there is but one pair in this species. Leaves bipinnate; leaflets formed of five pairs of pinnules, which are 1-6th inch long; flower heads globular, produced in pairs from the axis of the leaves; peduncle half an inch long. A very good plant for a pot, but better adapted for the margin of a conservatory border.

A. pubescens.—This is a neat plant for a pot or small conservatory border, being rather delicate and much inclined to assume the umbrella shape. Stem pubescent. Leaves bipinnate, about 1½ inch long, primary leaflets about 3-5ths inch long, of which eight pairs constitute the leaf. Leaflets formed of 12 pairs of pinnules of about 1-10th inch long; racemes produced singly from the axis of the leaves, about 3 inches long; flowers globular, small, yellow. A rather slow growing species, which will not stand pruning.

A. pulchella is best adapted for the margin of conservatory borders, or for the centre of a circular bed which is to be filled with dwarf plants; for by means of the knife you have free control over its shape and habit; its height is from 6 to 7 feet, and it forms as dense and compact a bush as any plant with which I am acquainted. Leaves about 1-5th inch long, formed of four pairs of leaflets, which are 1-10th inch each in length. Flowers globular, small yellow, produced singly, and furnished with a spine on each side of its base. Peduncle 2-5ths inch long. For a low bush, in a conservatory border, this stands almost unequalled.

A. pentadenia is another fine Acacia, well adapted for pot culture. Branches erect; and although making a nice compact bush, it does not become too dense, but is of a nice slender and open character. Leaves bipinnate, composed of two pairs of leaflets, the lower composed of seven pairs of pinnules, and in length about half as long as the upper ones, which are composed of 12 pairs of pinnules. Flower heads globular, produced in twos, threes, fours, or fives, from the axils of the leaves. Peduncle ½ inch in length. A nice plant for a greenhouse stage.

A. præmorsa.—This has a rather straggling habit, but it is well adapted either for pots or borders, and certainly makes handsome plants when about 3 feet high, though it will require skilful management in training to prevent its becoming unsightly from the loss of its lower phyllodes. The latter are triangular, ⅛ inch long. The branches grow about 1 foot or 15 inches in the course of a year, and are covered with flowers from the apex to the commencement of the season's growth. Peduncle ½ inch long; but its phyllodes are almost hid by its profusion of flowers. Altogether a pretty plant.

A. paradoxa, although of straggling growth, is suitable for pot culture, standing the knife well; phyllodes ½ in. in length, very wavy, unequal sided; situated very closely together along the stem, furnished with two sharp spines at the base of each, rendering the plant very prickly by their stiffening as they grow old. Flowers globular, of a bright yellow, produced very plentifully. Peduncles the same length as the phyllodes.

A. Riceana.—This forms a magnificent plant for a large conservatory, towering to the height of some 25 feet, and producing long pendulous branches hung their whole length, as it were, with numberless bunches of flowers. The latter are sessile, arranged upon a peduncle of from 2½ to 3 inches long. The phyllodes are 3-5ths inch long—linear, stiff, and nearly as sharp as needles when they get old. This plant is capable of being trained into whatever shape you may require it. It also bears the knife extremely well, and is a most abundant flowerer.

A. rotundiflora forms a loose spreading shrub, of about 3 feet high, and as much in diameter; it is most suitable for pots. Phyllodes ½ inch in length, somewhat rotundate, rather pubescent, and deep green; flowers globular, bright orange yellow, solitary, sometimes in racemes of two to four heads; peduncle ⅔ inch long. This is by no means a plant of fine habit when allowed to assume its wild form; but with judicious pruning, and by training tastefully upon a balloon-shaped trellis, allowing the shoots to hang gracefully from the top, its appearance is greatly improved, and when in flower it forms a worthy inmate of our greenhouses.

A. verticillata.—This is one of the most interesting, and, at the same time, most beautiful and conspicuous, of Acacias, and well worthy of a prominent position either on the greenhouse stage, conservatory shelves, or in the borders, where its graceful habit must render it a favourite. Its phyllodes, as its name implies, are arranged in a verticillate manner, although in broken whorls of about 1-5th inch apart; the phyllodes are about 3-10ths inch in length, linear, stiff, and very sharp pointed. Its flower heads are about an inch in length, of an oblong shape, and seated upon a peduncle of about 3-10ths inch long; in some cases they appear singly, in others four or five flower heads are so arranged as to appear verticillate. Nothing is better than to allow this species to take its own natural habit, for the use of the knife or ligatures would not improve it.

The following alphabetical list will show at a glance the time of flowering, form of flower, &c., of the various sorts just described:—

Name.	Time of flowering.	Form of Flower Heads.	Size, &c.
Acacia armata	Late	Globular	Large
,, alata	Late	Globular	Middle
,, biflora	Early	Globular	Small
,, cochlearis ...	Middle	Globular	Middle

—*J. A. Beckman.*

IS THERE POSITIVE PROOF OF THE ORIGIN OF WHEAT FROM A GRASS BELONGING TO A DIFFERENT GENUS?

By L. C. Treviranus.

The question where those objects of cultivation originated which are so indispensable to man in a state of civilisation does not, when taken by itself, admit of any general answer; but considered in a wider extent, can only be answered conditionally. For either the answer is inseparable from the general question as to the development of the human race, and so far lies out of the range of experience, or we must assume that these objects were found by man in a state of nature, and in the condition in which they were found applied to his uses; or, finally, that they at first existed in a certain form which has been modified by the agency of man, so that the original state is no longer extant, or if so, in such a condition as not to exhibit the transition from the cultivated plant to the parent from which it was derived. The first method of reply holds the question as in itself unanswerable, and in some measure coincides with those views which regard the objects of cultivation, such as the Laurel, the Myrtle, the Vine, the different kinds of corn, &c., as the gifts of the Gods, that is, of beings who introduced cultivation into the earth from their unknown habitations. The second answer to the question must have been received unconditionally as the right one, were it clear that our cultivated forms have ever been found wild, or still are found so; that is, whether they have ever lived or still live in any specific locality independently of the agency of man. But the necessary proofs are altogether wanting.

When Bureau de la Malle would make it probable from

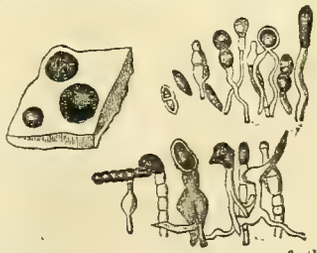
historic dates that the part of Palestine and Syria which borders on Arabia is the parent country of corn, namely, of Wheat and Barley (Ann. de Sc. Nat. ix. 61); when Heinzelmann would consider Wheat as growing wild in the country of the Baschkirs, and A. Michaux Spelt in the mountains in the north of Hamadan, in Persia (Lamarck, Encyc. Bot. ii. 458), we must bear in mind that, as regards the first, we can place very little reliance upon the accounts of the occurrence of species by persons who were little acquainted with objects of natural history, or upon their description or pictorial illustrations; and that, in respect of the other instances, a far longer residence than falls to the lot of travellers in general in the countries where they are supposed to have taken their origin is requisite, in order to distinguish the wild state of a plant from such as have merely escaped from cultivation. There remains, then, only in answer of the question, that a typical form of these plants originally existed, which has been so modified by art and human skill, in conformity with man's necessities or uses, that it is no longer capable of being recognised as such, though existing in its wild state, or together with the form produced by culture. That such alterations of plants have been effected by cultivation, and are now become permanent, is beyond question. Our biennial cultivated Carrots, with their succulent well-flavoured roots, may be produced in perfection after some generations, by the art of the gardener, from the annual wild form, whose root is dry and of an acrid taste (Lond. Hortic. Soc. Trans. ii. 348). We cannot, however, prove the origin of other cultivated plants by experiment; we are ignorant, for instance, how the Cauliflower originated from the normal form of our Colewort. The wild form of our Potatoes is far from being perfectly known. Of many forms found apparently wild in the lower mountains of South America and Mexico, which have been introduced into sytematic natural history under the names of *Solanum Commersoni, maglia, etuberosum, immite, verrucosum, utile, stoloniferum,* &c. (D. C. Prod. Syst. Veg. xiii. s. 1, 32, 677; J. D. Hooker, Bot. Antarct. Voy. 32), sometimes one, sometimes another is brought forward in proof that an alteration of the original form has been effected by culture, which by repeated reproduction has become permanent, but whose derivation from that particular species has not been observed. A similar origin has been assumed for our species of corn, especially for the most important of them, viz., Wheat, but no one had succeeded in indicating the original form, and the alterations which had taken place. That this, however, has been effected we are assured by M. Esprit Fabre, an intelligent gardener at Agde, near Montpellier, to whom we are indebted for some excellent observations on the plants of his rich neighbourhood (Ann. des Sc. Nat. 2. Ser. vi. 378, 3 Ser. xiii., 122). The observations on which this result is grounded have been published by the author himself very briefly in a small pamphlet entitled "Des Ægilops du midi de la France et de leur Transformation," 20 s. in 4to., with three lithographic plates; and Prof. Felix Dunal, of Montpellier, has added a short preface and appendix, and I have myself, when at Montpellier in the autumn of 1851, had an opportunity of examining some dried specimens of the plants resulting from the experiments of M. Fabre, which had been communicated by him to his friends in that neighbourhood. M. Fabre considers Ægilops ovata and Æ. triaristata, of which the first especially abounds everywhere on the coasts of the Mediterranean, as the parent plants of our Wheat, an opinion by no means new, but one which had never before been supported by such weighty arguments. The genera Ægilops and Triticum, it is well known, though they agree in inflorescence, in the multitude of flowers, and in the general form and texture of the parts of fructification, differ in this respect, that the glumes in Ægilops are more swollen, that the upper spikelets are abortive, containing no ovaries but only stamens, and that the fruit, instead of being convex on either side, as in Wheat, is concave. The presence and number of the awns is inconstant in either genus, and in a species or form of Ægilops which Requien found in Provence, and named Æ. triticoides, but which occurs in Sicily, at Palermo, as appears from specimens now before me, and, if as I believe, Link's Crithodium Ægilopoides (Linnæa ix. 132, t. 3) be the same thing, in Greece also, the glumes are gradually flatter, so that their form, especially as at the same time there is but one awn instead of several, approaches very closely to that in the genus Triticum. Fabre, whose attention was attracted by this phenomenon, undertook in consequence a series of experiments with Æ. ovata, which he cultivated with the greatest care for 12 years, from 1838 to 1850, and at first in a plot of ground inclosed by walls, in which no other species of Grass existed, and afterwards in the open field, surrounded however by vineyards. The result of this experiment was that the plant acquired longer ears, whose rachis was not brittle as before when ripe, and in which, step by step, fewer blossoms were abortive; the glumes, meanwhile, were less broad and flatter; instead of a number of awns, in general one only remained; and the ripe grain, which in consequence of its concave form remained inclosed in the hollowed glume, burst out by reason of its increased thickness. In brief, the species Ægilops ovata had acquired a form, represented in the figures, which every one must recognise as that of a Triticum, and which in continued cultivation was retained without any tendency to return to its original condition. M. Fabre observed also that Æ. triaristata, Willd. was subject to the same metamorphoses, only he became acquainted with this species too late to make the same experiments with it which he had made with Æ. ovata, so as to be able to prove its transition into Triticum. His treatise closes with these words: "We had here also (instead of Ægilops ovata with which the experiment was commenced) a Triticum, a true species of Wheat, which cultivated in the open field for four successive years retained its form and yielded harvest like that of other corn of this kind;" and M. Dunal adds, "We are in consequence necessitated to allow, that certain of our cultivated kinds of Wheat, if not all, are nothing more than peculiar forms of certain species of Ægilops, and that they can be regarded as none other than races of these species, so that to M. Esprit Fabre belongs the honour of having demonstrated the true origin of cultivated Wheat, which others before him only imagined and have indicated doubtfully."

Whatever consideration, however, may be due to this expression of so acute and practical an observer, who not only from personal acquaintance with a near neighbour, but from an immediate inspection of the result obtained by these experiments, was in a condition to judge of the correctness of the observations, and the justice of the inferences, the subject is too important, not to make one wish for a repetition of the experiments by a combination of many persons of different views — experiments which are easy of repetition, and have no other difficulty than the length of time requisite before the necessary result can be attained. We have before us the coincidence of two genera so different in apparently essential characters as Triticum and Ægilops, and the question arises, if a transition between these is established, must not other genera of Gramineæ in a similar way fall to the ground? But more especially, inasmuch as the normal condition of the several species of Ægilops is maintained in their native localities, it is requisite to know more perfectly than we have learned from M. Fabre, what are the conditions and influences under which the observed changes have taken place, before we can regard the results which have been obtained as perfect verities in the annals of science and agriculture.

SOAP MOULD.

It is well known that the mischievous effects of fungals are not confined to the raw materials of the vegetable world, whether living or collected for industrial purposes. What is called mildew in glass, paper, silk, and other manufactured articles is due principally to their agency, connected, more or less, with chemical causes, under peculiar conditions of moisture and temperature, and I have now before me a very curious case forwarded by Mr. Hort, in which the subject of attack has been a peculiar kind of soap, prepared at Cheltenham, by Mr. Beetham, who has kindly and promptly answered such questions as were proposed to him on the subject. The soap, known by the name of toilet soap, is of a singular character, into the composition of which honey and milk enter largely; and partly in consequence of the trouble attendant on its manufacture, partly on account of the development of the fungal, the preparation of it has been of late neglected.

The fungal was developed in those specimens only which were wrapped in tinfoil, those in paper remaining unsullied. In the former case a large portion of the squares were infested with broad jet black velvety somewhat conical spots, like little volcanoes, penetrating the substance by their rootlets, and rendering the article perfectly unsaleable. Each spot consists of a number of dark black spores, arranged occasionally in short necklaces, varying very greatly in form, and seated on hyaline or slightly discoloured threads, which vary as much as themselves in thickness and external characters. So variable are the spores, that if individuals only were examined, the species might be referred to several distinct genera, but, when all are taken in connection, the genus *Torula* seems the most proper place for its reception.



It is probable that the occurrence of the mould depends upon the animal matter which enters into the composition of the soap, which is in general not a substance subject to such injury, but the curious point is that, unlike the moulds which usually attack manufactured articles, it is no ubiquitous species, as *Cladosporium herbarum*, but incapable of being referred to anything described. The species may be characterised as follows:—*Torula Saponis* soris conico-depressis orbicularibus; sporis versiformibus fibrillis radicantibus enatis. *M. J. B.*

SARRACENIAS.

Where the accommodation necessary for the successful cultivation of these plants can be found, a few of them should be grown, as they are extremely interesting, and, under proper treatment, they grow freely. They are not difficult to flower, and their blossoms are pretty enough, but it is the curious pitcher-like appendages belonging to the leaves which render them worth attention. They are found in a wild state in swamps in North America, and are by no means tender, but, as their natural habitats indicate, they require a moist atmosphere, plenty of water at the root, and a warm shady situation during the growing season, to have them in perfection.

Those who intend to commence their culture should procure a healthy young plant at once of each of the following varieties, viz., S. purpurea, rubra, variolaris, and Drummondi. They should be placed in a low pit, where the temperature can be kept at about 60° by night, allowing it to rise to 75° or 80° with sun heat, before admitting air—shading during bright sunshine, to prevent the necessity of drying the atmosphere by currents of air to keep down the temperature. Turn the plants out of their pots, removing as much of the old soil as can be done without injuring the roots, and repot them in convenient sized pots, using light fibry peat, broken up roughly with the hand. Fill the pots about half way with crocks, on which lay some thin pieces of peat; and in potting be careful to pack the soil closely and nicely about the roots, and cover with a thin layer of sphagnum, which will give the whole a neat appearance. The pots should be placed in saucers, which should be kept regularly filled with water during the growing season, and the water must be frequently changed, always using water at a temperature of 80° or 90°. Keep the atmosphere thoroughly moist by frequent syringings during bright weather, and keeping the pit close; and also see that the soil about the roots is kept regularly wet, for any approach to dryness would be injurious to the plants. As the specimens advance in growth, attend to affording them sufficient pot room, and do not defer shifting until the plants suffer for want of sufficient space for their roots. By following out the above system of treatment during the growing season, the plants will make rapid progress, and will form nice-sized specimens by autumn. At that season they may be removed to a warm corner of the conservatory or show house, where, by covering them with large bell-glasses, to secure the necessary amount of moisture, they will be quite at home for the winter months, provided a temperature of about 45° is maintained. Water must be liberally supplied, however, to the soil; and if convenient to continue the use of pans, it will be advisable to do so, as this will ensure keeping the roots regularly moist. Should the plants show indications of injury from the confined atmosphere, remove the glasses at night, replacing them before giving air to the house. In the absence of better accommodation, the plants may be grown during the summer in a one-light box, which, if it be kept close and properly managed, the will be quite at home; but artificial heat must be afforded in spring, otherwise large specimens will not soon be obtained, nor will the plants bloom freely.

Propagation is easily effected by means of division which should be done just before starting the plants in growth, taking care to select some promising pieces for rooting, and also to keep the young plants close, warm and thoroughly moist until they become well established in their pots. The same care must be observed with the young plants as to placing their pots in pans of water, &c., as recommended above. *Alpha.*

Home Correspondence.

Concrete Walks.—Seeing in a late *Chronicle* inquiries respecting the economical formation of walks, where material is expensive, I beg to furnish the plan adopted here under similar circumstances. I have had no experience with burnt clay; but as good gravel costs here 8s. per load of 24 bushels, delivered on the ground, it became necessary in laying down extensive terrace and garden walks (which within the last two years I have done at this place), to adopt some plan of economising this expensive material. Coarse gravel at a cheaper rate was obtained, and some excellent grey lime which we get delivered at 11s. per chaldron to two-thirds of the gravel was added one-third of quicklime,—in convenient quantities to work, say three or four loads at a time; sufficient water was added to reduce the mass to a semi-liquid state, so that it would just remain on the barrows whilst being moved to the walks. About 2½ inches in depth of this was spread on the intended form of the walk with the back of a shovel; when sufficiently dry to bear a man with out the foot sinking in it, but before it set hard, a roller was twice passed over it, which produced a smooth face so that no water could remain upon it. When thoroughly dry, one inch in depth of fine gravel was laid upon the surface, and it was rolled smooth; this effected a considerable saving of the best material, and a much better walk was the result than those made in the usual way; for whilst concrete walks remain quite unaffected by frost, worms, or deep-rooting weeds other walks that had been previously formed of several inches of brick rubbish as a foundation, and 3 or 4 inches of gravel on the surface, have been puffed up by the frost, and an indefinite number of worm mounds are continually being formed by worms, rendering much more rolling necessary than on walks formed of concrete; as, however, no water will pass through the latter, particular care should be taken to introduce a sufficient number of surface drains. I remark that fresh burnt lime, and that grey in preference to white, should be used. I have no doubt where cinder ashes abound, a large proportion of

might also be employed with advantage. *H. Howlett, the Gardens, Haverland Hall.*

Lucuma deliciosum.—I am glad to see this new fruit alluded to in your columns, though rather surprised and disappointed at the statement that it will require a Banana house, as Mr. Linden distinctly asserts that his collector found it, not only in thick woods, where it became a tree, but at an elevation of 9000 feet, where the thermometer falls to zero, and there it only attains a height of 8 or 9 feet, and fruits abundantly. This assurance made me desirous to try a plant on the system so successfully pursued with the Citrus tribe in South Devon, but your opinion makes me hesitate; perhaps we shall hear more about it soon. Notwithstanding the late rigorous winter, my hybrid Rhododendrons are in glorious bloom, especially some from cinnamomeum raised by Messrs. Rollisson, which are singularly beautiful. One plant of the true arboreum was finely in flower nearly a month ago, in the open ground, and the Luculia, flowers of which were exhibited in Regent Street, has shoots 6 inches long already. A tree of Acacia dealbata, between 20 and 30 feet high, is a mass of bloom, without an injured leaflet. *A Devonian.* [Since you possess the Lucuma, we trust you will be among the first to ascertain its constitutional peculiarities experimentally.]

Tree of 10,000 *Images.*—Amongst a variety of leaves communicated to me by Dr. Hooker from Sikkim, Bhotan, and Khasia, as presenting on the surface more or less distinct traces of vegetation, galls, or other morbid affections, are those of a species of *Symplocos* from Khasia, which at once, from the singularity of their marking, called to mind the tree of 10,000 images of Messrs. Huc and Gabet. Like other matters mentioned in the curious book which professes to give an account of their travels, and which, though evidently highly varnished and exaggerated, is to all appearance not a pure fiction like George Psalmanazar's "History of Formosa," the reality of the existence of such a tree rests probably to some extent, however slight,

on fact. Without having recourse with the missionaries to any notion of supernatural agency, or the trickery of crafty Lamas, it is very possible that a tree presenting certain analogous characters may exist in the country which they assign for its habitation, though the details may not deserve credit, and the figures of the plant and leaves are doubtless mere fictions. Be this, however, as it may, the leaves of which I furnish a figure do really present a very curious assemblage of characters on their under surface, which without any very great stretch of imagination, infinitely less, for instance, than that which would enable a Greek to read AI AI on the flowers of the yellow Martagon, or a royalist to behold Charles sheltered in the Oak depicted in the cross section of a Fern root, might very readily be considered by ignorant and superstitious people as truly literal characters, and if regarded as miraculous, wonderful enough to make the foreheads of the credulous "Sirs Lamas" trickle. They do not, however, resemble either of the alphabets in use in Tibet, of which they want the circular lines which characterise a great many of their letters, but much more Chinese or Japanese characters, to some of which they occasionally approximate very closely. The marks are raised above the surface of the leaf with a narrow but distinctly defined fissure down their centre, the cuticle having been ruptured by the swelling of the subjacent tissues, and resemble closely the apothecia of some *Graphis*, still covered by the epidermis. They do not, however, present any organised structure, but appear to be due not to the agency of insects but to a diseased state of the cells which still exist in their cavity corroded and lacerated, and surrounded, as is not uncommon in such cases, by a denser stratum; and it is very probable that such marks might equally be present on the smooth bark of the tree while young, though certainly not on bark shelling off like that of the Plane tree. It is not, however, necessary to follow up the points of resemblance or difference further, for it is not pretended that the species itself has given rise to the well-told tale of the French Missionaries, or at least fathered upon them; there is quite sufficient likeness at least to show that their story might have had a certain degree of foundation in fact; and, indeed, it would have been scarcely worth while occupying so much space with the subject did it not give an opportunity of figuring a very curious and previously unrecorded form of disease. *M. J. B.*

News about Orchids.—I have lately been into one of our savannahs, and have found some Orchids novel to me. One is a Cyrtopodium, which from its fragrance may be called odoratum, though I do not find that name in my edition of "Lindley." The flower-stem rises only about 12 or 18 inches, instead of 8 or 10 feet, as in our ordinary Cyrtopodium, and the flower is darker, spotted with purple. It is the only Orchid I have seen in this land that requires no shade. It is only known to grow in one part of this savannah, in the moist sand, exposed to the full glare of the sun. I have got a dozen plants or more of it. In the same savannah, but growing under the shade of low bushes, I found a very pretty Orchid, with a delicate pink flower, I think of the Ophrys tribe, but the flower is extremely evanescent, and the plant so delicate, that though I dug up a good number, not one, I am sorry to say, promises to live. In the same savannah, I am told, is to be found in April or May an Orchid of great beauty, but of singular description, having no bulbs or leaves, and shooting its flowers above ground on a short stem, somewhat like the Cyclamen of the south of Europe. *Demerara.*

Leaves from My Chinese Note Book.—No. V.

Chinese Indigo—a new kind discovered.—Those who read my "Wanderings in China" may remember the account I gave of a valuable kind of indigo made from species of woad (*Isatis indigotica*), which is extensively cultivated in the level country, a few miles to the westward of Shanghae; I have now to notice another kind, equally valuable, if not more so, which is made from a species of *Justicia*, or from a plant of that natural order to which Justicia belongs. This kind is largely cultivated in the hilly country near Ningpo, or rather in the valleys amongst the hills. It seems to be easily cultivated—it grows most luxuriantly, and is no doubt very productive. Having evidently been introduced from a more southern latitude, it is not hardy in the province of Chekiang, any more than Cotton is about Shanghae; but nevertheless it succeeds admirably as a summer crop. It is planted in the end of April or the beginning of May, after the spring frosts are over, and it is cleared from the ground in October. During this period it attains a height of a foot or a foot and a half, becomes very bushy, and is densely covered with large green leaves. It is cut before any flowers are formed. The Chinese method of preserving plants for next year's crop is most ingenious and well worth notice. I have already remarked that it is a tender plant, and consequently the roots left in the ground after the gathering season are all destroyed by the first frosts of winter. But the Chinese do not depend upon these for the next year's crop; nor do they take them up, or cover them in any way, but simply leave them to their fate, after having done their duty for one year. Cuttings are found to be much more vigorous and productive than the old roots, and to the preservation of cuttings the Chinese cultivator directs his attention. When the stems are cut for the manufacture of Indigo, a large quantity of them have their leaves stripped off, and are afterwards taken into a house or shed to be properly prepared. The leaves thus stripped from the cuttings are thrown into the tanks with the other stems and leaves, so that nothing is lost except what is actually required for the purpose of propagation. The stems are now tied up firmly in large bundles, each containing upwards of 1000, and the ends of each bundle are cut across, so as to leave them perfectly neat and even, both at top and bottom. These bundles are each about a foot long, and, of course, nearly round. Having been thus prepared, they are carried to a dry shed or outhouse, where, in some snug corner, they are packed closely and firmly together, and banked round with very dry loam. A portion of the dry soil is also shaken in between the bundles; and this being done, the operation is complete. Should the winter prove unusually severe, a little dry straw or litter is thrown over the surface of the cuttings, but nothing else is required. During the winter months, the cuttings remain green and plump; and, although no leaves are produced, a few roots are generally found formed, or in the act of forming, when the winter has passed, and the season for planting has come round. In this state they are taken to the fields and planted. The weather during the planting season is generally showery, as this happens about the change of the monsoon, when the air is charged with moisture. A few days of this warm showery weather is sufficient to establish the new crop, which now goes on growing with luxuriance, and requires little attention during the summer—indeed none, except keeping the land free from weeds. In the country where this dye is grown, there are numerous pits or tanks on the edges of the fields. They are usually circular in form; and one which I measured was 11 feet in diameter, and 2 feet in depth. About 400 catties* of stems and leaves are thrown into a tank of this size, which is then filled to the brim with clear water. In five days the plant is partially decomposed, and the water has become lightish-green in colour. At this period the whole of the stems and leaves are removed from the tank with a flat-headed broom made

* A Chinese catty is equal to 1⅓ lb.

of Bamboo twigs, an admirable instrument for the purpose. When every particle has been removed, the workmen employed give the water a circular and rapid motion with the brooms just noticed, which is continued for some time. During this part of the operation, another man has employed himself in mixing about 30 catties of lime with water, which water has been taken out of the tank for the purpose. This is now thrown into the tank, and the rapid circular motion of the water is kept up for a few minutes longer. When the lime and water have been well mixed in this way the circular motion is allowed to cease. Four men now station themselves round the tank and commence beating the water with bamboo rakes made for this purpose — the beating process is a very gentle one. As it goes on the water gradually changes from a greenish hue to a dingy yellow, while the froth becomes of a beautiful bright blue. During the process the head workman takes a pailful of the liquid out of the tank and beats it rapidly with his hand. Under this operation it changes colour at once, and its value is judged of by the hue it presents. The beating process generally lasts for about half an hour. At the end of this time the whole of the surface of the tank is covered with a thick coating of froth of the most brilliant colours, in which blue predominates, particularly near the edges. At this stage, it being desirable to incorporate the froth with the liquid below it, I witnessed a most beautiful chemical operation which took me completely by surprise, and showed how universally must be the knowledge of the effect of throwing "oil upon the waters." A very small portion of Cabbage-oil—only a few drops—was thrown on the surface of the froth, the workmen then stirred and beat it gently with their flat brooms for a second or two and the whole disappeared as if by some enchanter's wand. And so small a quantity of oil was necessary for this purpose that even when the cup had been emptied, and had only the oil that was necessarily adhering to its edges, it was thrown in o another tank, and produced the desired effect. The liquid, which is now darker in colour, is allowed to stand quiet for some hours, until the colouring matter has sunk to the lower stratum, when about two-thirds of the surface is drawn off and thrown away. The remaining third part is then drawn into a small square tank on a lower level, which is thatched over with straw, and here it remains for three or four days. By this time the colouring matter has separated itself from the water, which is now entirely drained off—the dye occupying 3 or 4 inches of the bottom in the form of a thick paste, and of a beautiful blue colour. In this state it is packed in baskets and exposed for sale in all the country towns in this part of China. What its intrinsic value may be when compared with the indigo of commerce, I have no means of ascertaining, but it is largely used in this part of the world, where blue is the most fashionable colour, judging from the dresses of the people. And it is possible that with our knowledge of chemistry a colour of this kind might be greatly improved. After being grown and manufactured as I have described, it is sold at rates varying from 50 to 100 cash a catty, say from 2*d.* to 4*d.* per lb. Some is sold as low as 30 cash, but this is very inferior; the greater part produced is sold from 60 to 80 cash a catty, and it must be of a very superior quality if 100 cash is paid. Like the Shanghae Indigo made from *Isatis indigotica*, it is called "Lien-ching" by the Chinese. I have just sent a large supply of the cuttings above described to the Agricultural and Horticultural Society of India, and hope the plant may prove of some value in a country where the Indigo of commerce is largely cultivated. *R. F.*

Societies.

Horticultural, *April* 4.—The Right Hon. Lawrence Sulivan in the chair. By far the most novel and striking object exhibited on this occasion was a flowering specimen of Rhododendron Dalhousianum, from Mr. Packman, gr. to J. Gadesden, Esq., of Ewell, to whom belongs the honour of having been the first to flower this plant in England. The only other place in which it has yet blossomed in Britain is Dysart House, in Fifeshire, where it produced flowers last year, under the care of Mr. Laing, gr. to the Earl of Rosslyn. Mr. Gadesden's plant had had five blooms on it; but two of them had dropped, leaving, of course, only three behind, each of which measured about 4½ inches in diameter, and as much in length. They somewhat resembled the flowers of the white Lily (L. candidum), except that they were deeply tinged in the throat with yellow. Notwithstanding their great size, they were not at all flimsy in texture; on the contrary the petals were thick, and the flowers extremely well formed. When it is considered that a single stem, some 18 inches in height, produced five flowers, the display that may be expected to be made by a large specimen, covered with blossoms of the dimensions stated, must be grand indeed; and, therefore, whether this Rhododendron prove hardy or not, it must certainly be regarded as a great acquisition. A Knightian Medal was awarded it.—Of Orchids, some fine things were again produced by Messrs. Rollisson, who furnished Cattleya citrina, a yellow kind found on branches of Oak trees in Mexico: the handsome purple C. Skinneri; Dendrobium albo-sanguineum, and D. densiflorum; Chysis bractescens; the Brassia-like Oncidium phymatochilum; an Anguloa; and one or two other plants. A Knightian Medal was awarded.—From Messrs. Veitch came a variety of Dendrobium macrophyllum, with a fine spike of flowers, nearly four times as large as those of the ordinary state of this plant, and they did not smell quite so strongly of rhubarb as those of macrophyllum generally do. The same firm also showed a variety of Calanthe vestita, the red colour in the eye of which was not so dark as that of the best form of this plant. Certificate awarded. — From Messrs. Lane, the great Rose-growers at Berkhampstead, came four boxfuls of the "Queen of flowers" in as fine condition as they possibly could have been in the month of June. They consisted of the newer and better sorts of Roses now in cultivation, and were stated to have been selected from a collection of no fewer than 500 plants. A Banksian medal was awarded them.—Of Hyacinths, Messrs. Henderson sent a large collection, from which six double and six single sorts were set apart for special competition, this being a day on which the Society had invited Hyacinths to be shown for prizes offered for them; but no other grower had courage enough to send any, and therefore the prize — a Banksian Medal—was awarded to Messrs. Henderson for the following varieties, viz, double: — Prince of Waterloo, L'Eclipse, Jaune Supreme, Madame Marmone, Triumph Blandina, and Laurens Koster; single:—Queen of the Netherlands, Orondates, Lord Grey, Gumal, Baron Van Thuyll, and Mrs. Beecher Stowe.—Messrs. Henderson also furnished the following plants, viz., a small example of Elæocarpus dentatus, covered with little white, toothed bell-shaped flowers; two Acacias; Eriostemon linearifolium, a pretty species; Boronia tetrandra; small plants of Grevillea lavandulacea; Daviesia pungens; Gastrolobium Drummondi; and Cheiranthera linearis, a New Holland plant, spoken of many years ago by Mr. Allan Cunningham, as being a plant of great beauty. It has violet or rather blue starry flowers of sufficient size to be showy; but unfortunately, owing to the want of bright sunlight in the room, they did not open, and therefore its beauty could not be seen. It was mentioned that wild specimens, however, showed the plant to be much more robust than that exhibited, which was small and somewhat attenuated. A Certificate of Merit was awarded it.—Of Camellias J. Allnutt, Esq., of Clapham Common, sent two blooms, one white and the other red; but both from the same tree, which had been in cultivation many years, but had never been known to sport in a similar manner before. It was remarked that this circumstance was a good illustration of the way in which many of our existing varieties, not only of Camellias, but also of other flowers and fruits, have from time to time been obtained; and Coe's Golden Drop Plum, which was stated to have sported in a similar way from the Magnum Bonum, was adduced in confirmation of the statement.—A dish of Keens' Seedling Strawberries was shown by Mr. Brown, gr. to F. Parnell, Esq., of Waltham Abbey, Essex.—Dr. Royle then drew the attention of the meeting to specimens of paper, rope, cordage, and other substances prepared from the Plantain (*Musa paradisiaca*). He also entered into highly interesting details concerning the amount of produce obtainable from an acre of Plantain ground, independently of the fruit, for which alone the plant is now cultivated in the greater part of the tropics. The paper, although for the most part unbleached, and not prepared with European skill, was of the best quality as regards strength and fineness. Some of it was of a delicate cream colour. The threads of the Musa textilis constituted, he observed, the invaluable Manilla hemp. After going into numerous statements upon these important points, he directed attention to a living plant of the *Boehmeria nivea*, Chou-ma, or China Grass, also called occasionally, though erroneously, Manilla hemp. Specimens of the raw material and of exquisite manufactures prepared by the Chinese from this plant were laid upon the table; the excessive strength of its fibres was pointed out, and it was shown that the Indian province of Assam was capable of alone supplying an unlimited quantity of such hemp. The Vice-Secretary produced a specimen of the plant from Shanghae, and remarked that since it was capable of enduring the climate of so cold a part of China it might be reasonably expected to succeed as a field crop in the west and south of Ireland. It had this advantage over common hemp, that it was perennial, not annual, and afforded two or three cuttings in a year; so that it might be found much cheaper to grow, and more productive, as well as of far better quality than hemp itself.—From the garden of the Society came a good specimen of Rhynchospermum jasminoides, Weigela amabilis, three Azaleas, the Sikkim Rhododendron theæflorum, two Eriostemons, and other plants, among which was the beautiful Tropæolum Triomphe de Gand, which is one of the most showy and useful of the genus.

Reviews.

A Flora and Fauna within Living Animals. By Joseph Leidy, M.D. Philadelphia. 4to, pp. 67, tab. x.

This is one of the publications of the Smithsonian Institution, and a very valuable addition to our knowledge of such vegetable or animal produtions as affect living organisms. It may be true that it does not contain much which may not be found in Robin's second edition of his admirable work on those fungals which grow on animals; but the illustrations are in some instances far more complete, and well worth the attention of every botanist and physiologist who may chance to be interested in the subject. We would point out more especially the plates which represent the curious parasites which infest the intestines of different species of Julus, and the several Entozoa which live in their company; for, though the principal of them are not overlooked by Robin, there is nothing in his plates as regards these particular productions which can for a moment be compared with Dr. Leidy's copious and excellent figures.

A question perhaps may be raised as to the real nature of some of these bodies, with reference to their respective claims to be considered as fungals or algæ. For our own part, we have little doubt that they are all true fungals, as also such productions as *Saprolegnia* and *Leptomitus*, which are so commonly developed upon living animals in water. The zoosperms indeed in *Saprolegnia* seem at first sight to remove such productions very far from fungi, but we strongly suspect that it will hereafter be established that they are mere states of different species of *Mucor*, a fact which seems to be indicated by the supposed transformation observed many years since by Carus, and described and figured in Nov. Act., 1823, t. lviii., of an allied production on the larvæ of a salamander into a species of *Mucor*.

The ravages committed by a fungal on silkworms are unfortunately too well known in those parts of Europe where silk is an industrial product, and the affection occurs in America as well as in the old world. Similar affections have been observed in other caterpillars and larvæ, and there is no doubt that the fungals thus exercise a very important office in keeping up the proper balance between the several parts of the living world. Dr. Leidy suggests this more especially with respect to the 17-year locust, whose larvæ are sometimes affected by a fungal, in consequence of which, though still living "the posterior third of the abdominal contents is converted into a dry, powdery, ochreous-yellow compact mass of sporuloid bodies. The caudal appendages, and posterior two or three abdominal rings covering the mass, are loose, and easily detached, leaving the fungoid matter in the form of a cone, affixed by the base to the unaffected part of the abdomen of the insect."

Dr. Leidy is evidently an original observer, though not perhaps completely *au courant* in European publications, and his work is one amongst numerous instances of the immense progress which is making every day in natural history in the United States; and no better proof of the wide extent to which a taste for such matters exists in that country need be given, than the large impression of their publication, which the Smithsonian Institution find necessary to supply the wants of the public.

The Practical Dyer and Scourer. By Thomas Love. Small 8vo, pp. 289. Longmans.

The author is a working dyer and scourer, living at 25, Great Windmill Street, Haymarket, and he gives his brethren in the trade the benefit of his practical knowledge and long experience. He also communicates instruction to thrifty housewives, showing them how they may dye and scour for themselves. For instance—

"*To Dye Five Ladies' French Merino Dresses Five Different Colours, from Ruby to dark Brown, in one little Copper.*—In my instructions for cleaning woollens (see p. 90), I said, Sort your woollens and put up all to dry except the marones, the clarets, the rubies, and all sorts of brown merino dresses. These woollens have been prepared for dyeing, that is, boiled off in muriate of tin, alum, and copperas; they are now dry, and ready to dye with any of the many dye stuffs that crimson and brown can be dyed with. I shall dye them now with cudbear, in preference to archil or peachwood; although in the state they are at present, being full of preparation, they are ready to suck up any dye-stuff they may get.

"Clean out well a small copper, that will hold four or five pails of water, fill it up, and get it on to a boil; have a clean copper bowl, and begin.

"*The Ruby*, first. Put in your copper bowl 2 lbs. of cudbear, and mix it well with clean water, as you would flour. When mixed, put it in the copper, and take your ruby merino dress, dry as it is, and handle it well in the copper, boiling it well all the time for 40 minutes; now fill up the copper, and take the work out, and put it to drain over one of your clean small vessels, to save the liquor that will run from it; when it is taken out of the copper, the tenter-hooks are the best for it to hang by; now tell your man to rinse this ruby dress in three cold waters, and hang it up directly in a warm room to dry.

"*Crimson* is next. I sometimes give those a scarlet body first; I have not done so in this case, so we must go on. Now mix in the copper bowl as before 1 lb. of cudbear, and put in the copper, stir it well, and handle the crimson merino dress in the copper for 40 minutes; the copper boiling well all the time; now fill the copper, and take it out to drain as before, and give it to your man to rinse; tell him to give it five minutes in a common sour, and a cold water after the sour; hang it up to dry, and see that he does not touch the ruby with it.

"*Marone* is the next merino I will dye in this copper. Put 1 lb. of cudbear in the copper for this dress, stir it well and handle it in; make it boil well, and give it 20 minutes, and then get it up; put in the copper ½ lb. of turmeric, and the merino back again for 20 minutes longer, well handling and boiling it all the time; now fill up the copper with clean water, take up the work to cool, and give it to your man to rinse and hang up to dry carefully.

"*Claret* is next in the same copper. Give this another pound of cudbear and half an hour's good boiling; take

it up, and fill one of your large kettles with scalding water; melt ½ lb. of copperas in it, handle it well in this for a quarter of an hour; take it up, cool, and rinse it in three waters, and put it in the copper again and boil it well for half an hour; get it up to drain, and tell your man to rinse it well and hang it up to dry.

"*Brown* and *Rappee* are next in your copper. For these two merinos, put 1 lb. of cudbear, 1 lb. of turmeric, and 1 lb. of sumach in the copper, and handle in these two merinos, and boil them well for half an hour; fill up the copper, and hang them up to drain over a kettle, and melt 1 lb. of copperas in the kettle you had for the claret, and handle them in this for half an hour, and get them up and rinse them in three waters, and put them back in the copper and boil them for half an hour; get them up to drain, give the man the brown to rinse and hang up, and return the rappee merino in the saddening for a quarter of an hour; take it up, rinse, and return it in the copper; boil it well for half an hour, take it up, cool it, rinse it, hang it up, and tell your man to empty the copper, and fill it up with clean water, and you have done."

In another place the mystery of cleaning carpets is revealed:—

"Have them taken up and well beaten, brushed, laid flat on a floor, and the spots taken out by rubbing a piece of hard soap on the greasy spot, and rubbing it out with a brush and clean cold water, well drying each spot as it is done with a cloth before you leave it. Cut a bar of the best mottled soap into two gallons of water, and put it on the fire to dissolve, and when dissolved, begin and scour the carpet in the manner following:—Take two pails of blood-warm water, and put in one of them two quarts of the melted soap to scour the carpet with, and the other pail of warm water is to rinse the soap and dirt out of the carpet as you go on with the cleaning, which must be done at less than one square yard at a time. Now dip a brush into the pail with the soap in it, and lift it out on the carpet, and scour about a square yard at a time, while on the knees, and do it so as not to let it go through to the back of the carpet; when this spot or yard is cleaned well with a soap and brush, rub the soap well out by means of a flannel or coarse sponge, and suck up in the sponge or flannel the wet and dirt that was made on the carpet by the scouring-brush, and rinsing the flannel in a pail of clean water repeatedly. Have a pail of clean cold water and a little common sour in it, and have a clean sponge and dip it in the sour, squeeze it well, kneel down and rub the sponge well into the spot you have first cleaned and rinsed. Now this spot must be dried with clean coarse cotton or linen cloth, before you leave it as properly done, and before you proceed with another yard of the carpet. Cleaning carpets dry exemplifies the old saying, and the true one, 'You should rub off as you go.' And so you must go on, square after square yard, until the carpet is entirely cleaned. A good fire ought to be in the room to help dry it on the floor as fast as it is done. The floor must be clean and dry before you begin to scour the carpet.

"*Remarks.*—I have cleaned this carpet with the best soap, but I do not like it so well as Feild's oil soap; for, after the mottled soap is melted, it congeals as it gets cold, whereas Feild's never congeals after it is once melted, and Feild's is the cheapest. It is to be had at Legg's, in Wardour Street, Soho; and Barnes's, Long Acre; and of the makers."

It is easy to see that these instructions come from a man who knows what he is talking about; and, we dare say, Mr. Love's volume will find a place by the side of cookery books, British wine-making, and those other useful volumes which constitute the private library of economical housekeepers. At all events it ought to be placed there.

Mr. Luke Hansard has just published a pamphlet upon *Strikes and Lock-outs* (Aylott & Co.), concerning which we can only remark that his queer crabbed English wholly destroys the effect of his good intentions.

New Plants.

54. Oncidium cæsium *Rchb. fil. in Regel's Gartenflora*, t. 80.

This is certainly a mere variety of *Oncidium reflexum*, with leaves more glaucous than usual, owing perhaps to bad cultivation. Such differences as are pointed out in the figure and description, if sufficient to establish a species, would lead to the sub-division of every species of Oncidium yet known, and to a multiplication of names which can only render a subject, already sufficiently difficult, altogether impenetrable. The plant has no horticultural value.

55. Dendrobium macrophyllum, var. *giganteum*.

At the last meeting of the Horticultural Society Messrs. Veitch produced a variety of this well-known species with flowers four times as large as usual. It was a shade lighter in colour than the common kinds, and not altogether so strongly scented with rhubarb. We believe it was obtained from the Continent with some garden name indicating its being, what it is not, a new species.

56. Allosorus flexuosus. *Kaulfuss.*

This is a South American Fern, of slender growth and graceful habit. Although little known, it is, in my opinion, worthy of notice, on account of its fragrance, which I am inclined to think will render it an especial favourite with those who are cultivators of this interesting and truly beautiful tribe of plants. I remember to have first met with it about 17 years ago, in the garden of the Baroness Bassett, Tehidy Park, Cornwall, where I was told it had accidentally made its appearance among some other plants that had been then received from Real del Monte, in Mexico, of which country I presume it is a native. Through the kindness of my friend Mr. Cady, of Tehidy, I have again renewed its acquaintance, and by means of a specimen lately forwarded to me, have found it to possess the property of being remarkably sweet-scented, resembling that, with which we are all more or less familiar, of the Pteris aquilina, or common Brake, after it has been cut for some time and dried in the sun, but far more powerful, the smell of a small frond being sufficient to fill a large room. *W. B. Booth.*

Garden Memoranda.

Crystal Palace at Sydenham.—The more gigantic works in the Park, connected with this, in all respects, wonderful speculation, are now getting somewhat into shape, and those which, from the nature of the ground, have required less labour to accomplish, are beginning to assume a finished appearance. In anticipation of opening on the 24th of May, increased exertions are being made to have everything in as forward a state as possible; but, although the terrace gardens may be completed by that time, yet it is scarcely possible that the heavy operations towards the bottom of the park, where islands have to be formed, huge mounds and embankments raised, and, consequently, immense quantities of soil conveyed from one place to another, involving both much labour and time, can do more than exhibit, by the day fixed for opening, the great distinguishing features of a design, which, when completed, must be the wonder and admiration of everybody. The tons of soil that have been moved, since this park has been commenced, are incalculable; and many more must yet be turned over, and conveyed from one place to another, before all shall have been accomplished that is contemplated. The transfer is effected by means of trucks, drawn by horse-power on railways, put down temporarily for the purpose. The two projecting wings of the palace, enclosing the ends of the terrace garden, are progressing rapidly, more especially the one on the Norwood side, which is nearly up; and all the more important ground operations connected with the formation of the terraces have been completed. The upper terrace only requires the broad walk, that runs parallel with the palace, to be fine gravelled to be finished; a great portion of the turf on the terrace garden below has been laid down, and, notwithstanding the very dry weather for such work, the planting of the beds here is now being actively proceeded with. Those at present finished have been filled chiefly with the finer varieties of deep crimson and other Rhododendrons, several of which are coming into bloom. Many of the beds are edged with the pretty little Erica carnea, which is also now in flower, and very interesting in appearance it is. In order to counteract the ill effects of drought, the newly planted shrubs, not only here, but in all other parts of the grounds, are being continually watered at the root during the whole day, and towards evening they are syringed overhead with garden engines. Many young specimen Deodars, varying from 8 to 12 feet in height, have been recently planted, both on the terrace and in the park; but these having had good balls, do not appear to be the least affected by the change. The walks in the terrace garden are nearly all rough gravelled, and the different basins for the fountains have been formed, and only wait for the latter to render this garden in a tolerably advanced state. The bottoms of the basins have been puddled with clay, so as to keep them from leaking, and all round the outside of the white stonework, which forms the sides, has also been puddled for a distance of 3 feet in width, in order to effect the same end.

In our last report we stated that the main central walk had been formed as far as the first great fountain in the park; since that time no more of this noble promenade has been made, but the channels for the waterfalls and succession of little cascades on either side of it have been roughly blocked out as far as the first great lake, into which they are to empty themselves over piles of ornamental rockwork. The site for the immense valley of water which is to spread all over this lower part of the park is also now apparent; great portions of the stonework along its margin, more especially on the Anerley side, being built, and a great extent of the sloping banks around it being turfed and already under the scythe. These banks are traversed by flights of white stone stairs, which lead from walks on the higher ground down to the water's edge. The bottoms of the lakes are being covered with burnt clay, which is also largely employed here for walks, for which it is found to be cheaper than gravel. It is burnt with small coal, first (after having made a good fire in the centre, with air-holes to it), putting a layer of coal and then a layer of clay, and so continuing these concentric layers till the heap is large enough. Numbers of heaps of this kind, smoking and smouldering (for they must not be allowed to burst into flame), may now be seen in different parts of the ground, but especially in the great valleys intended for the water. In these, islands are beginning to make their appearance; but as yet so shapeless that no idea can be gleaned of what their ultimate forms may be. Several of the Saurian mousters that are to ornament them are, however, already placed out of doors. Those at present set out are in the corner of the park nearest Anerley.

Passing up towards the Palace, the whole of the ground on the west side of the central walk will be found in a tolerably advanced state. On the little knoll, a short distance east of the new railway station, is being erected a series of corrugated iron arches, supported on metal pillars, and furnished with ornamental trellis work for climbing Roses and other drapery of that kind. A belt of Roses has also been planted round the base of this floral temple, which, when fully covered with foliage and flowers, cannot fail to be a feature of much interest, more especially when viewed from the terrace garden, from which it is not far distant. The planting of the clumps on the Anerley Road side of the grounds with Rhododendrons and other shrubs is being proceeded with at a great rate; and it will be gratifying to know that few if any deaths have occurred among things previously planted here, either from frost or other causes. The great extent of turf alluded to by us in our last report, as having been laid down here, is now green and beautiful, showing no symptoms of suffering from drought.

The ground work on the large track of park lying between the east end of the Palace and the Sydenham boundary is also now receiving special attention. New walks are being formed here, planting is being done, the surface in general is being levelled and put into shape, and considerable portions of it have even already been turfed; owing, however, to the parched condition of the ground, especially on a natural knoll here, the newly-laid down turf was quite brown, and looked burnt up. At the base of this hill, a small triangular lake is already filled with water, but, with this exception, all the other lakes are as yet dry, and will apparently not be ready to receive their contents for some time to come.

We imagine we have now said enough to show that, notwithstanding the number of men employed (and they literally swarm in every part of the grounds, their number of late being nearly doubled), a large amount of work has yet to be effected before this large and fine park, with its beautiful undulating surface, judiciously interspersed with trees, shrubs, and sheets of water, with their islands and waterfalls, shall have been completed. With regard to the large fountains, the taking down of the water towers has prevented their being worked, at least for the present; but that does not affect the smaller ones. It may also perhaps be worth while to state that the walks, after draining them well, are all bottomed here with faggots, which are covered with burnt clay or rough gravel, and over that will be laid fine gravel when the walks shall come to be finished.

FLORICULTURE.

The Chrysanthemum.—In the following remarks respecting Chrysanthemums I shall chiefly confine myself to the mode of cultivating them in pots. As soon as the plants have done flowering, I cut them down, and place them in any convenient corner on the south side of a wall, where they are in some measure sheltered from frost and north-easterly winds. They remain in this situation undisturbed, except by watering them now and then, until the present time, when they are removed to a more open place, preparatory to their being wanted for the purpose of propagation. Chrysanthemums may be increased by cuttings, layers, and offsets; I have often grown them from the latter; but I have found the foliage so apt to go off them, and leave the plants naked at the bottom, that I greatly prefer cuttings, which, with good treatment, will retain their foliage green and healthy almost to the rims of the pots. The best time for putting in cuttings is the latter end of April, or the beginning of May. I use the points of the best shoots of the current year's wood, not more than 2 or 3 inches in length, cutting them close to a joint, and removing the bottom leaves. When potted, I transfer them to a close frame; and if it is convenient, I assist their striking by means of a gentle bottom-heat, but this is not absolutely necessary, for they strike readily without it. I shade for a few hours in the daytime, until they have taken root, when I give them plenty of air, and pinch out their tops, which causes them to break freely. When the shoots have grown an inch or two in length, I pot into 3-inch pots, in a mixture of turfy loam and one-third rotten dung, selecting the strongest and bushiest plants, and discarding the rest. When potted, I again place them in a close frame, and shade a little until they have made fresh roots. They are afterwards set out of doors, sufficiently far apart to prevent their being drawn, and kept well supplied with water. When the shoots have grown 3 or 4 inches in length, I again pinch out their tops, in order to make them bushy; and after they have grown an inch in length, I shift the plants into 6-inch pots, placing them again in their former situation; and when they have filled the pots well with roots, I re-pot them into 9-inch pots, in which I flower them, using the same compost as before. I now place them thinly in a nice open place, where they have a free circulation of air: this keeps them dwarf and healthy. I keep the pots clear of weeds and suckers; water them as often as they require it; and when they have fairly set their flower-buds, I give them some good clear manure-water twice a week, or more or less according to the state of the weather. About the beginning of October, I remove some of the most forward plants under glass, giving them plenty of air during the day. The others are taken in as they are required, or as the weather may render necessary; for though hardy, the Chrysanthemum will not stand more than 4° or 5° of frost, without sustaining some injury. I bloom here every year about 150 plants, varying from one to two

feet high, and having from 25 to 30 full blown flowers on each plant, many of which do not require a single stake to suppport them. It may be worth while to remark that, if some of the most promising shoots of out-door plants are layered in the beginning of September, by giving them a twist, and pegging them down a few inches below the surface of the ground, so as to make young plants about ten inches high, they will be well rooted in three weeks, *i.e.* if they are kept watered. When rooted, they may be taken up and potted in 6-inch pots, and placed in a close frame for a few days, while they make fresh roots; afterwards they should have plenty of air. Plants managed in this way are very suitable for the front shelves of the stage, or for mixing with other plants. The earliest and best flowering of the plants I take cuttiugs from are selected and planted in any vacant places in the shrubberies, all the shoots being first shortened back to within six inches of the pot. This causes them to make more shoots, which are again stopped, thus keeping the plants dwarf and in due bounds, and inducing them to bloom at a season when few flowers adorn the garden. *T. R.*

NATIONAL FLORICULTURAL SOCIETY, *April* 6.—Mr. Hancock in the chair. A Certificate was awarded on this occasion to a Pansy called Memnon, exhibited by Mr. Turner. It is a large flower, colour dark purple maroon, smooth, and of good texture; three blooms were exhibited. A Certificate was also awarded to the same for Cineraria Sir C. Napier, a dark indigo-blue kind, with good broad petals of good substance; also a Label of Commendation for a pretty alpine Auricula, named King of Crimsons. This is a neat round flower, buff ground, with shaded crimson edges.—Mr. Bousie, of Stoke Park, contributed a finely bloomed plant of his seedling Cineraria, Rose of England, which on a former occasion received a Label of Commendation. This one, however, it was awarded a Certificate. Two well bloomed plants were also sent of Bousie's Optima, a large clear bold Cineraria, pure white, with deep-blue tips; this variety received a Certificate in 1853. It is a fine flower.—Mr. Clark sent Cineraria Beauty of Streatham Place, but it was not in good condition. It has a white ground, with deep purple edge, inclined to cup; the footstalks are quite hard and wiry.—Messrs. Lee sent a Cineraria named Star, white, tipped with bright rose; a showy variety, but not of the best form. There were a few promising Auriculas, a Polyanthus, and a box of 30 fine blooms of Pansies, from Mr. Turner. The best of them consisted of Victory, Comet, Uncle Tom, Emperor, Monarch, Fair Rosamond, Sovereign, Royal Standard, Earl Mansfield, Satisfaction, Lord John Russell, Lord Palmerston, National, and Sir John Cathcart.

Miscellaneous.

Poireau d'été Petit de Brabant.—This is an early Leek, with very long narrow leaves, of a dark green colour. It is not so well adapted for a main crop as the large Rouen Leek and some others, because, if sown at the same time, it is more apt to run to seed than they are. But a little of it may be sown for early use with advantage. *Journal of Hort Soc.*

Advice to Artists.—If the principles which these remarks have been intended to explain are important to those who would represent vegetable forms as they are, they have, if possible, a still greater bearing upon those compositions in which plants and their parts are to be employed conventionally. It is to be hoped that the time is approaching when good taste will shrink from huge bouquets hung upon curtains, or carpets loaded with mountains of fruit, or muslin dresses made uncomfortable with eternal garlands of leaves and flowers, put in with a due regard to impossible perspective, and incomprehensible light and shade. Refined taste is shocked at such offences against common sense, and seeks eagerly for that which is beautiful without being ridiculous. Is it not possible that devices of botanists, not intended for decoration, but for the representation of ideal truth, may lend some assistance to the manufacturer? Botanists are accustomed, for the purposes of abstract science, to project the parts of plants, and especially of flowers or fruit, upon plane surfaces, preserving all the organs in their due position with respect to each other, but neglecting form and other minor attributes. Such projections they call diagrams. Their nature and the mode of constructing them will be the best understood by an example; for which purpose the Raspberry flower may be selected. In this flower the centre is occupied by a number of small grains forming a circular heap, each grain having a thread or style proceeding from its end; these would be represented in a diagram by numerous circles, with or without the threads. Next the grains comes a fleshy rim, which may be represented by a wavy line. Beyond this stand about 20 stamens, the expression of which would be as many rays, with oblong or globular heads. On the outside of the stamens are placed five petals, imitated by as many curves of any form; and then come five green leaves in two rows, indicated by any five points. This gives a regular figure, which represents to the eye of a botanist a Raspberry flower; but, by certain slight alterations of form or proportion in the constituent parts, the same diagram may be made to change its whole aspect without changing its material form; and of these changes I should think that intelligent artists might avail themselves. Some hundreds of thousands, nay millions of variations of this are conceivable, and they seem to answer all the exigencies of manufacturing art. I certainly think that, in this way, much may be done by the taste and skill of those who know how to apply principles to practical purposes. I have no doubt that if an artist were to take the Victoria Lily, and project all the multifarious parts of it, of different forms, upon a plane surface, and make such changes in it as would be perfectly allowable for such a purpose, consistently with the structure of plants, he would obtain an elaborate pattern, in which taste could find no fault, and in which unintelligent surprise would find much to admire. *Professor Lindley's Symmetry of Vegetation.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—The bright sunshine and cold drying winds which have recently prevailed will, unless means are used to counteract their effects, soon destroy the beauty of the finest specimens, particularly if their blooming has been forwarded in a close moist atmosphere; and although it is yet too early to bring shading into general use, it will be impossible, without its assistance, to preserve the blossom of plants during such weather as we are now experiencing. Blinds can hardly be looked upon as anything better than necessary evils; for, besides their being troublesome and expensive, it is very difficult to arrange them so as to prevent their being continual eyesores, through their disfiguring the house. It is therefore worth while to have them so arranged as to be easily drawn up or let down, and to be as little conspicuous as possible when not in use; for if they are troublesome to move, there is a great tendency to use them more than is absolutely necessary, and nothing can look more dismal than a house wrapped in canvass when the sun is hid; and besides the disagreeable appearance, it is most injurious to any growing plants in the house, and also prevents those in bloom from attaining their proper colour. Whatever material is used for blinds, it should be light and strong, for what is wanted is merely to break the force of the sun's rays, without darkening the house. A nice, light, open-made canvass forms the best article I have met with. A close net is superior in some respects, but so objectionable in the case of lofty houses, from its liability to get torn through moving it up and down, that it is altogether unsuitable. It will be necessary to admit air freely, to keep down the temperature during bright sunshine, such as we have experienced for some days past; but avoid, as far as possible, allowing currents to blow over the plants, and counteract their drying effect by keeping every available surface moist.

FORCING DEPARTMENT.

PINERY.—Plants swelling their fruit must be frequently looked over, to see that they are sufficiently moist at the root; for if they are allowed to get too dry here, the fruit will not reach the size that it would under proper treatment. It is, however, very easy to err in the opposite extreme, and some care and practice are necessary to enable one to properly water plants having their pots plunged. This sort of work, therefore, should not be entrusted to inexperienced hands, who would probably water every plant, if the surface soil indicated dryness. Use clear weak manure-water in a tepid state, for all plants that are moderately well rooted. Keep the atmosphere regularly moist, but avoid heavy syringings over the plants, and give air sparingly until the external atmosphere becomes warmer, and more congenial to vegetation; shut up early in the afternoon, allowing the glass to stand at 85° or 90° for an hour or two after shutting up and syringing the house. VINERIES.—Proceed as expeditiously as possible with thinning the fruit, and regulating the growth, in succession-houses, endeavouring to get all such important work as this done at the proper time, for it is a very bad practice to allow the Vines to produce a quantity of laterals, which only serve to exclude the light from the useful foliage and render it liable to scorch when the laterals are removed; and allowing a quantity of fruit to attain some size before cutting it off, is simply taking a proportionate amount from the weight and quality of the fruit, which the Vines will bring to perfection. Give inside borders a liberal supply of tepid manure water, using that from the stable tank when it can be obtained. Admit air carefully during the prevalence of drying winds, and maintain a moist atmosphere, using the syringe freely, except where the Vines are in bloom, or where the berries are beginning to change colour. It is of importance, however, to secure a supply of pure soft water for syringing with, as, if limy water is used, the fruit and foliage become coated, or specked with a crustation of lime, which injures as well as greatly disfigures them. PEACHES.—Trees swelling their fruit must be carefully attended to with water, giving liquid manure to those in a weakly state, or that show indications of being overcropped for their strength. Keep the young wood nicely and regularly tied in, and guard against insects and mildew by a liberal use of the syringe, and the timely application of tobacco water and sulphur.

FLOWER GARDEN AND SHRUBBERIES.

What with bright sunshine and strong drying winds, it will require the utmost care to save recently transplanted evergreens of large size. And no mere surface watering will be of any service, but the ground about the roots as well as the ball should be thoroughly soaked. After applying water, and allowing the surface to become moderately firm, stir it slightly with a blunt fork, which will prevent its cracking, and will also allow the free action of the sun and air to warm the soil, and encourage the production of active roots. Surface dress with fine soil and water, newly laid turf, whenever it is observed to be suffering from the effects of the dry cold weather. Take advantage of the present dry weather to stir the surface soil of shrubbery and herb borders, to prevent the growth of weeds, and give a fresh clean appearance. Do not neglect to put in plenty of Mignonette; and if not already done, hardy annuals should be sown without further loss of time, except in cases where they are not wanted to bloom before autumn.

KITCHEN GARDEN AND HARDY FRUIT DEPARTMENT.

See that recently transplanted trees are not suffering for the want of water; this, however, will hardly be the case except on soils of a very porous dry nature, and in such cases the ground should be mulched with decayed leaves, to preserve it in a uniformly moist state. Attend carefully to the protection of the blossoms of all fruit trees; where nothing better or more convenient can be obtained, Yew or Spruce branches will be of service, provided they are so fixed as not to be liable to be blown against the blossoms. Remove the covering as frequently as convenient on fine days, so as to fully expose the trees to sun and air. Get a supply of tobacco water in readiness to attack the aphides immediately they make their appearance on the Peach trees. Sow Broccoli on beds of light rich soil in an open situation for the main crop, and Cabbage, Cauliflower, Lettuce, &c., for succession; also attend to sowing small breadths of Turnips about once a fortnight, so as to secure having a regular supply in a fit state for use. Put in a small breadth of an early variety of French Bean on a warm, dry, sheltered border, and plant a quantity in small pots to be raised in a cold frame, and planted out as soon as the danger of frost is past. Use the hoe liberally among growing crops, to destroy weeds, and keep the surface loose and friable.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending April 6, 1854, as observed at the Horticultural Gardens.

March and April.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature of the Air. Max.	Min.	Mean	Temperature of the Earth. 1 foot deep.	2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 14th, 1852—therm. 73 deg.; and the lowest on the 16th, 1847—therm. 20 deg.

Notices to Correspondents.

AUSTRALIAN WINE: *W. M.* Not yet arrived. Many thanks. How can a parcel of books be most conveniently and unexpensively sent to you?

CONIFERS: *Anon.* We doubt whether your plants, having become corkscrewed at the root, will ever lose the form; if they do not they will never be healthy, and will probably be blown down some day. You have, however, done all that was possible under the circumstances. Barron's "Winter Garden," or Brown's "Forester," will give you the information which we suppose you to be seeking. So will Loudon's "Arboretum Britannicum." We do not think that Deodar seeds are on sale anywhere.

EXHIBITION AT CHISWICK: *Verax.* We cannot explain how the writer in the last No. of the "Florist" makes out his "facts." But we know that he entirely misunderstands the case; we content ourselves with referring to what he asserts about Orchids, as a sample of his accuracy. He assures the readers of the "Florist" that the additional medals offered by the Society in 1853 for Orchids amounted in value to 106*l.*; but if you will turn to the offer itself, as advertised, May 7, 1853, you will see that it amounted to only 53*l.*, exactly half the estimate of the writer in the "Florist." Surely we may be excused from making any further reply to such statements. Examine the facts, and judge for yourself.

FOUNTAINS: *Nemo.* We know of no better lining for a fountain than Portland cement; it will stand if well done and of very good quality.

GREEN-FLY: *W C E.* Fumigation with tobacco is the only remedy.

NAMES OF PLANTS. We have been so often obliged reluctantly to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Erzeroum.* 607, Cystopteris dentata; 529, Astragalus Echinus; 332, Astr. Lagurus; 881 A, Astr. tragacanthoides; 1260, Astr. sp. n.(?); do any of these yield Tragacanth?—Have we sent you the new edition of the "Vegetable Kingdom?" 37, Onobrychis cornuta; 1212, Onobrychis Pallasii; 1259, Hedysarum grandiflorum.—*V D.* The long green Okra is probably Hibiscus esculentus; you must treat it like a Balsam. The Osage Orange is Maclura aurantiaca, a hardy shrub much used in the United States for excellent hedges. Raise it in a little heat, and then prick it out under hand-glasses. Soil is immaterial.—*A Devonian.* The flower is so crushed that nothing can be made of it. But it is supposed to be Hemerocallis flava. The "Hibbertia" is Candollea cuneifolia.—*A H.* Anemone alpina and apennina are distinct species; but A. acutipetala is a mere variety of A. pulsatilla.—*Diss.* This is certainly Doronicum Pardalianches, whatever the other may have been; perhaps it was D. plantagineum, sometimes confounded with it. —*T Gaines.* Some Pomaderris; we will ascertain what species, and tell you next week.—*R L.* Acer rubrum.

VINES: *R H.* Stoves will do no harm, provided you keep the air damp, and the stoves do not exhale any noxious vapour, a habit of which it is by no means easy to cure them. We should have thought a flue cheaper.

*** As usual, many communications have been received too late and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

TO MANURE MANUFACTURERS.

THE Directors of the Crystal Palace Company are prepared to exhibit in the Agricultural Department samples of MANURES and other substances applied to the Soil. The terms, &c., may be obtained on application to the above department at this office.—3, Adelaide Place, London Bridge, April 8.
G. GROVE, Secretary.

PERUVIAN GUANO, Bolivian Guano, Superphosphate of Lime, Nitrate of Soda, Sugar Scum, and every description of Artificial Manures.
WM. INGLIS CARNE, 10, Mark Lane, London.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

PEAT MOSS CHARCOAL, AND OTHER MANURES.—The Undersigned are appointed sole Agents by the Peat Moss Charcoal Company, for the sale of this valuable fixer and distributor of ammoniacal matter.
Also on Sale, Peruvian Guano, Superphosphate of Lime, Gypsum, Nitrate of Soda, Bone-Dust, Sulphuric Acid, and all other Manures of known value.—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

SUPERPHOSPHATE OF LIME MANUFACTURED BY MR. J. C. NESBIT'S IMPROVED STEAM MACHINE. The following is the analysis of an average sample.
"College of Chemistry, Agriculture, and General Science, 38 & 39, Lower Kennington Lane, London.
Analysis of Sample of Superphosphate of Lime from Mr. Jolliffe:

Moisture		13.97
Organic Matter, &c.		21.98
Silica		6.05
Phosphate of Lime		35.27
SOLUBLE	16.10	
INSOLUBLE	19.17	
Sulphate of Lime, &c....		22.73
		100.00
Nitrogen (equal to)		1.16
Ammonia		1.41

(Signed) J. C. NESBIT."
For price and full particulars, apply to E. Y. JOLLIFFE, 70, Mark Lane, or the Works, Lavender Dock Wharf, Rotherhithe.
Agents wanted in all the principal towns.

SEWAGE GUANO, 5*l.* 5*s.* per ton (bags included). Circulars and Testimonials forwarded on application.

DEODORIZING CHARCOAL, 1*l.* 10*s.* per ton (bags to be returned). Terms: Cash on delivery.
The Manchester Sewage Guano Company, 3, Watling Street, Shudehill, Manchester. E. RANSBOTTOM, Agent.
JOHN THOMPSON, Secretary.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained at the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 4*l.* per ton, and in quantities less than half a ton, at 5*s.* per cwt., for ready money only: and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage. No charge for sacks.
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, Agents for London: and from all the other Agents of the Company.

PERUVIAN GUANO, WARRANTED OF THE BEST DESCRIPTION, AND THE DIRECT IMPORTATION OF MESSRS. ANTONY GIBBS & SONS; LAWES'S *Patent Superphosphate, Nitrate of Soda, Bone Dust, and all other Natural and Artificial Manures, at the lowest remunerative prices.*—*See* RENDLE'S "FARMING PRICE CURRENT AND AGRICULTURAL DIRECTORY," to be obtained from W. E. RENDLE & Co., Seed Merchants, Plymouth.

SAMUELSON'S PRIZE FORKING or DIGGING MACHINE, as applied to Spring Cultivation, serves to thoroughly pulverise land which has been trodden by sheep or autumn ploughed, deepening the staple, leaving no pan, dragging up the Couch Grass, and preparing a finely divided seed-bed.
Extracts of Testimonials and references to persons using it.
"Answers thoroughly; brings everything to the surface."—*E. W. Wilmot, Congleton.*
"The very best a man can have upon a mixed or stiff soil, it so thoroughly pulverises it."—*Joseph Cooper, Acton Burnel, Salop.*
"I inform you, with the greatest satisfaction, of its success."—*Francis Hamilton, Friars Place, Middlesex.*
"Attached horses at half-past 8, on 5½ acres, finished at a quarter past 3, making first-rate work."—*J. Kirby, Bodicott, Oxon.*
"Has been working every day."—*T. Cardus, Barwell, Surrey.*
"Will do a given amount of labour, not only cheaper but better than the plough."—*J. J. Mechi, Tiptree, Essex.*
"Let me have one at your earliest convenience."—*Earl of Essex, Cassiobury, Herts.*
"Send to Exton Park one of Samuelson's Forking Machines for *Earl of Gainsborough, Oakham.*"
"Besides improved tillage, economises ploughmen."—*P. Gener, Cuba.*
"Been digging all the week; the *champion* of all implements in England: should be very sorry to be deprived of it."—*Thomas Lawrence, Thurlaston, Dunchurch.*
Price 24*l.* 10*s.*, the general purpose size; and 27*l.* 10*s.* large size, Cash; at the Works, Banbury.

MORNING FROSTS.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.
"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey. (Removing in May next to 112, Regent Street, London.)

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

WEDLAKE'S OAT-CRUSHERS, 2*l.* 15*s.*; do. 4*l.* 5*s.*; Chaff-cutters, 1*l.* 7*s.*; do. 3*l.* 7*s.*; Mangles, 2*l.* 10*s.*; Flour-mills, 4*l.* 10*s.*—118, Fenchurch Street.

FOR HOME AND FOR AUSTRALIA.—Cheap Corn Winnowing Machines, Wheat Dressing Machines, Flour Dressing Machines, Threshing Machines, Oil-Cake Breaking Machines, Turnip Cutting Machines, Brick Making Machines, Tile Making Machines, Sowing Machines, Chaff Cutting Machines, Oat Crushing Machines, Barley Crushing Machines, Grass Mowing Machines, Reaping Machines, Washing Machines, Mangling Machines, Wringing Machines.
All improved and at Free Trade Prices. List of Machines free per post, 1*s.* 4*d.*; How to Keep a Horse Cheaply, 1*s.* 4*d.*—MARY WEDLAKE & Co., 118, Fenchurch Street. Established Half a Century.

THE GENERAL LAND DRAINAGE and IMPROVEMENT COMPANY.—Incorporated by special Act of Parliament.—Offices, 52, Parliament Street, London.
Directors.
HENRY KER SEYMER, Esq., M.P., Chairman.
Sir JOHN VILLIERS SHELLEY, Bart., M.P., Deputy Chairman.
John C. Cobbold, Esq., M.P. — William Fisher Hobbs, Esq.
Sir William Cubitt, F.R.S. — Edward J. Hutchins, Esq., M.P.
Henry Currie, Esq. — Samuel Morton Peto, Esq., M.P.
Thomas Edward Dicey, Esq. — William Tite, Esq., F.R.S.
William Wilshere, Esq.
Empowered to execute or to assist Landowners in executing with their own capital Works of Land Improvement, viz., Drainage, Irrigation, Roadmaking, Enclosing, Reclaiming, and the Erection of Farm Buildings upon any Estates, under Settlement, Mortgage, or Disability, and without any investigation of title, to charge the total amount of the outlay and expenses upon the property improved, to be repaid by annual instalments, varying according to the number of years over which Landowners may determine the repayment shall extend.
WILLIAM CLIFFORD, Secretary.

GRAND POULTRY SHOW AT BATH, JUNE 7th, 8th, and 9th. In connection with the Bath and West of England Agricultural Society, but with a separate entrance and subscription.
Director and Steward—JONATHAN GRAY, Esq.
The Honorary Secretary will forward Prize Lists and Certificates of Entry on application.
All Certificates must be returned to him on or before the 10th of May, or Exhibitors will be excluded.
All Advertisements for the Catalogue must be forwarded to him by the 10th of May.
By the kind liberality of the Great Western, the Bristol and Exeter, and South Devon Railway Companies, all Poultry will be taken to and fro free of carriage, provided the same are not sold.
HENRY SPACKMAN, Honorary Secretary, 6, Terrace Walk, Bath.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—PRIZE SHEETS for the LINCOLN MEETING may be had on application to the SECRETARY of the Society, No. 12, Hanover Square, London.

The Agricultural Gazette.

SATURDAY, APRIL 8, 1854.

MEETING FOR THE FOLLOWING WEEK.
THURSDAY, April 13—Agricultural Imp. Society of Ireland.

A VERY interesting discussion on the policy and on the methods of collecting annual returns of the agricultural produce of the country has been proceeding at the last two meetings of the Society of Arts. It was opened last week by a paper from Mr. LEONE LEVI on the need and value of such information; and this week the same gentleman read a statement of the method he would propose for collecting it. Abstracts of both papers will be found in our columns.

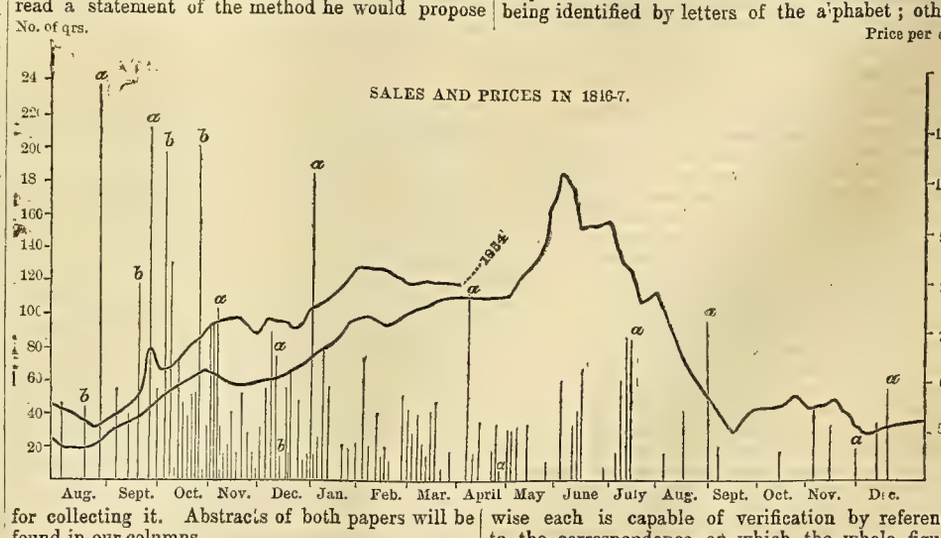
Mr. CAIRD described at the first meeting the plan for the same purpose, which he had drawn up and submitted to Government; and on Wednesday last Mr. LUMLEY described the plan which Government had actually conducted to a successful issue in the counties of Norfolk and Suffolk. These several methods will be found described in another page, and will furnish matter for future remark.

The preliminary consideration as to the utility—and especially the agricultural utility of agricultural statistics—was not so entirely taken for granted as to be altogether lost sight of. Several speakers referred to it, some believing that the information published would be useless, and others that it might even be injurious to the farmer. These opinions were well combatted by Mr. CAIRD; and a short paper on the same side was read by Mr. MORTON, in which records of the sale of the harvest of 1846 over 1500 acres in different parts of the country, were quoted, in order to show how the farmer was interested in obtaining correct and early information of the produce of the country. The subjoined woodcut is reduced from the diagram exhibited by Mr. MORTON, in which these sales are represented. And it is to the information, on which it is founded, that we wish very shortly to call the attention of our readers.

In the first place it is a striking illustration of the readiness with which agricultural information is granted to inquirers. On Thursday of last week some 20 letters were written to gentlemen occupying land in different counties in Scotland and England, asking the following almost impudent question:—"What were the dates and quantities of the several sales by which you disposed of the Wheat, whether old or new, which you held, whether in barn, rick, or field, in October, 1846." And by return of post back came information giving full details of the disposal of upwards of 50,000 bushels of Wheat grown in that year, corresponding to probably 1500 acres in that crop, and therefore perhaps 10,000 acres of arable land. In some cases the object of the inquiry was strongly disapproved of,—the writers believing that the information would, by guiding the movements of importers, cheapen corn, and so injure the growers of corn,—but even when this was the case the information asked for was frankly supplied. And we here gratefully acknowledge the confidence which has been exhibited in the good faith and intention with which the inquiry was made.

Some of these returns were not detailed enough to be useful—some proceeded upon a mistaken idea of the object, and referred to sales of the *year* 1846, whereas the sales of the *harvest* of that year were what was desired; in a few cases the information was given generally and not in figures. One gentleman who replied in this way gives a most conclusive testimony, as we believe it to be, on the commercial as well as the agricultural importance of the information which trustworthy agricultural statistics would supply. He says that he sold all his old Wheat in October, 1846, and all his new crop during the winter and spring, before the high prices came, being guided in this by one in the corn trade whose judgment proved erroneous, and who was afterwards ruined by the extravagantly altered views which he entertained when high prices set in. So here was damage done both to the commercial man and to the agriculturist by ignorance.

The diagram represents, by the vertical lines upon it, the sales of ten gentlemen farming in Lincolnshire, Gloucestershire, Berks, Hampshire, Sussex, Mid-Lothian, and Dorsetshire; the scale on which they are drawn does not admit of the several lines being identified by letters of the alphabet; otherwise each is capable of verification by reference to the correspondence on which the whole figure is founded. It may suffice to say that the curved lines indicate the way in which prices varied



during the months August, 1846, to December, 1847, the height of the curve indicating that of the prices as the months passed on; and the key is given in the right-hand column of figures, where the price per quarter is stated. The vertical lines indicate successive sales of Wheat; their position indicates the date of each, and their height shows the amount of each sale, as may be read in the left-hand column of figures, by which it will be seen that several individual sales exceeded 200 quarters.

Now, of course, it needs no record of facts, such as is given here, to prove that price must be inversely as supply, and that just as prices are excessive is the fewness of those who benefit by them, and the number of those who are injured by their ignorant sale of produce while prices were low; but an actual record of sales, such as is here given, will, it is thought, be more influential than any mere *à priori* reasoning, and as such we commend this diagram to the attention of all those farmers who believe that information on our food supplies would be useless to them. They will see how the great majority of sales were effected while prices were low, crossing the curve of price before it had attained any height, and how very few were effected while it was near its maximum. Let them remember, too, that these sales were conducted by intelligent men, and by strong men too—there was no need for *them* to dispose of their Wheat so early in autumn, on account of the approach of rent day. These sales were the deliberate resolution of reasonable men, guided simply by what information was accessible to them. Take that first sale by letter *a*, for instance: Prices had been falling ever since May, and he threshed out one-fourth of his whole produce in August, in order to obtain a price before it had got lower; in order, in fact, to obtain what looked to be the highest price of the year—*the fact is, he got the lowest price of the year!* If he had known how the crops were turning out he would have been better guided; and if he had known that in October he would have accurate information on the subject, he would have waited till October for it. He not only injured himself by his ignorance, but he injured all those smaller farmers who are *forced* into market before rent day, and whose prices are necessarily very materially affected by these sales of the greater holders, conducted in utter ignorance of what it is for their personal interest to do. It is in this way, too, that the information, which all admit would be useful to our great corn importers, would be useful to corn growers as well. All farmers are corn merchants; and if great importers are guided aright in their purchases, it will be a safer, steadier trade for those smaller holders who grow what they have for sale.

But we must postpone further remarks on the subject till next week.

To avoid the removal of straw at the expiry of the lease, unless where its equivalent of manure is returned, the incoming tenant sometimes agrees to take the whole crop at a valuation, but the most effectual barrier to removal is the practice of "steelbow;" for under it the straw, like the land, is the property of the landlord.

Under "steelbow" the statistics of the away-going crop are generally taken by the outgoing and incoming tenants, the bushel and balance determining quantities. So long as crops were threshed by the flail the practice had to contend with many difficulties, and not unfrequently fell short of the truth; but now that we have steam engines to thresh and sack the corn ready for market, obstacles of this kind are beginning to disappear, hence we lately suggested the statistics of the away-going crop, or last crop of the lease under renewal, or crop at the expiry of periods for the renewal of agreements under tenancy at will, as the case may be, as a distinct branch of statistical science.

The proposition forms part of the general one we enunciated the other week, and not the least important branch of it; for if a definite per centage of crops were thus ascertained annually in every county, it would prove a counter check, as it were, to the accuracy of the other returns, and might be preferred by many for the regulation of rents and the like, now determined by the corn averages and fiars prices. If we suppose, for example, that at the expiry of every 20 years landlords and tenants, instead of appointing valuators to revise rents at renewals by inspection, adopted the more practical plan of setting to work themselves with the balance and bushel, then this would amount to five per cent. in every county on an average, or one-twentieth of the whole crop yearly, so that over this area the yield per acre, and price, could be certified in a manner beyond objection. Every county-schedule might have columns for returns of this kind, which, when compared with the others for a series of years, would afford probably a truer index to corn merchants for the regulation of imports than they could have without them. The benefits gained would, therefore, be of the highest value, and shared by all parties.

Landlords and tenants, however, would be the greatest gainers, for the actual statistics of the away-going crop would enable them to base the contract of lease upon a more solid foundation than they now are able to do, and, by consequence, improve the relation between them during its currency; for the former would then know how much rent they ought to receive, and the latter how much they could safely afford to give.

NOTES ON SOME EXPERIMENTS IN THE BOTANICAL GARDEN OF THE ROYAL AGRICULTURAL COLLEGE.—No. III.

By Professor J. BUCKMAN, F.G.S., F.L.S.

In completing the notice of our green-food plants, it remains to comment upon the eight following species, namely:—

1. Symphytum asperrimum, Prickly Comfrey
2. " officinale, Comfrey
3. Heraclium sphondylium, Cow Parsnip
4. Poterium sanguisorba, Burnet
5. Achillea millefolium, Millefoil
6. Plantago lanceolata, narrow-leaved Plantain
7. Brassica Napus, Rape
8. Sinapis alba, Mustard

About four years since the *Gardeners' Chronicle* contained a notice of the properties of Symphytum asperrimum, recommending it for cultivation as a green food plant; from this I determined upon procuring some plants, which I accordingly obtained, and planted them in a plot of ground five yards square, preserving nearly the distance of 2 feet between each set. It soon grew to a great height, and stooled out so abundantly that the following year I might have planted a quarter of an acre. When growing I used to amuse myself by taking branches of it into the meadow to the cows; and it was highly curious to watch how eagerly they surrounded me, and with what appetite the whole plant was demolished by them. Again, the first crop, on being cut down, was taken into the feeding stalls, where the cattle as readily devoured it; this clearly showing that the plant is far from unpalatable, whilst the laboratory report upon it shows it to be rich in flesh and fat forming principles. In speaking of the qualities of this plant, Dr. Voelcker, to whom I am indebted for the subjoined analysis, makes the following remarks.

"In its fresh state, Comfrey contains more moisture than white Mustard; but notwithstanding this large proportion of water, the amount of flesh-forming constituents in this plant is considerable. This appears still more striking by throwing a glance at the composition of the dried plant. The whole plant, and more particularly the stems, contain a great quantity of gum and mucilage, but comparatively speaking little sugar."

The following is the composition of Symphytum asperrimum with respect to its alimentary substances:—

	In Natural State.	Dried at 212° Fahr.
Water	94.74	...
Nitrogenised substances (flesh-producing matters)	0.69	13.06
Substances not containing nitrogen (heat-giving and fat-forming substances) ...	3.81	72.49
Inorganic matters (ash)	0.76	14.45
	100.00	100.00

This plant does not require a rich soil, yields two abundant crops in the course of the year, and at the same time keeps making fresh shoots, which can readily be divided, to make new plants. We have not yet tried it in the practical department of the farm, and perhaps on a large farm, with a regular system of cropping, it is not advisable; still I am convinced that for small holdings, a patch of a few yards devoted to this plant would be well employed. It takes but little trouble to cultivate; one or two hoeings, to keep down the weeds until the sets make head, will be sufficient to keep it clean, as the large leaves of the plant keep down any extraneous growth; it can be cut down when 2 or 3 feet high, and used as a soiling plant. Its bed will last many years, if manure be dug in between the sets every spring, which supplies the waste of constantly carrying away the crop, and loosens the soil about the plants.

Symphytum officinale.—On introducing the S. asperrimum to my botanical garden it struck me that notwithstanding the latter is known as a Caucasian species (which was introduced as a garden plant, on account of the beautiful colour of its flower bells), yet that the former scarcely presented those marked differences which should belong to species. I therefore determined to plant some specimens of S. officinale, concluding that, if I could get a plant from the waterside to grow in an upland district remote from water, so great a change of circumstance would at least exert great influence upon its growth. Accordingly a plant with white bells was introduced into the botanical garden, which at once grew abundantly, and the following year was subdivided into several sets, which flowered, but this season the flowers became stained with a dull reddish blue tinge, and each season great changes have gone on in this plant, so that in fact in the summer of 1853 it was scarcely distinguishable from the S. asperrimum; and as these changes cannot be otherwise than interesting in a scientific point of view, I have drawn up the following comparison, to mark it in as clear a manner as possible.

SYMPHYTUM OFFICINALE (wild).—*Flowers* pendent, white, sometimes stained with red. *Leaves* of the root on long petioles; petioles slightly winged; of the stem all decurrent. *Habit.*—Plant covered with rough hairs, from 18 inches to 2 feet high.

SYMPHYTUM OFFICINALE (cultivated).—*Flowers* pendent, buds a darkish red, a light blue when expanded. *Leaves*—of the root on long petioles—of the stem slightly petiolate. *Stem* with a slight leafy line marking the position of the decurro. Plant rough, from 3 to 4 feet high.

SYMPHYTUM ASPERRIMUM.—*Flowers* pendent, buds vermilion, bright blue when expanded. *Leaves*—of the root on long petioles—of the stem quite petiolate. *Stem* with a mere line marking the position of the decurro. Plant rough, from 3 to 4 feet high.

These experiments tend to show that, however different plants may appear, after all, they are not specifically distinct; and I so far felt the interest of experiments of this kind as to induce me to draw up a notice of the changes of the Symphytum for the meeting of the British Association at Hull. In an agricultural point of view it has a further interest, because we now know that the S. officinale has the same properties as the S. asperrimum; it too will admit of field cultivation: that, taken from its natural situation by the river side and brought to the field, it does not degenerate, but gradually increases in size and strength, so that, should any one wish to experiment upon the food properties of Symphytum, our own observations lead to the conclusion that our common wild species is admirably adapted for the purpose.

The *Heraclium sphondylium* grows well in my plots, and its herbage is eaten readily by pigs; and cattle in general may do tolerably well upon it; but as yet I can see nothing about it to recommend the plant for cultivation. It is often found abundant in Grass meadows, where, although fed off by cattle, it is very unsightly; and as the plants are large and coarse, should be eradicated as a weed, on account of the great room it takes, to the prejudice of the growth of Grass, which is so much better.

The *Poterium sanguisorba* and *Achillea millefolium* are examples of plants which can never be cultivated as self crops, but the fineness of their herbage recommends them (as they are not objected to by sheep and cattle) for sparing admixture with seeds in laying down pasture, as there can be but little doubt that the hay and even Grass of mixed plants of a wholesome kind is much preferred to that of an unmixed or unvaried description.

These plants are particularly good in thin upland districts, as they readily grow, and thus tend to keep the ground covered.

Plantago lanceolata, so common in fields, especially on upland soils, offers a very useful bite for sheep, and where mixed with seeds is really a valuable plant, though in one field of seeds, about four years since, we had scarcely anything but the Plantain, when it was so distasteful to the sheep as to be mostly refused by them. Its upright method of growth, when compared with the P. media, which grows flat on the ground, will recommend it, or at least lead to its not being molested in pastures, while the latter should in all cases be treated as a weed. This plant was introduced into my garden principally with the view of demonstrating its habit of growth to my class.

Brassica Napus.—Rape does not succeed well on our poor soils, and is hence a most unprofitable crop; however, if it paid to cultivate the seed, it would be worth trying with this view, as, though it would not produce an abundant herbage, yet, on the principle of arrested development, we should have reason to hope for a good seed crop; and the change from the uplands to the deeper soils would be so beneficial as to render the seed valuable for planting.

Sinapis alba is much used on stubbles, and its quick growth and use for sheep should recommend a quantity being sown each year, as it is a change of food considered to be of value in sheep farming. It has been occasionally sown on headlands on our farm, and here, from the better preparation of the soil, from that adopted in sowing on the stubbles, its crop is sometimes enormous—so much so as to lead to the assumption that under some circumstances it would be a soiling crop worth cultivating with care; and from its quick growth and the certainty with which it can be managed, there would be no difficulty in preparing for succession to any amount. *Cirencester, March* 15.

NOTES OF A RECENT AGRICULTURAL TOUR IN IRELAND.—By MARTIN DOYLE.

FORTY years ago I was well acquainted with the southern parts of Ireland more particularly; within this period my visits there have been "few and far between," and during the last 20 years, until the the spring of 1853, they had ceased altogether. I then left England with the intention of ascertaining by personal observation how far modern progress has produced changes not only in the localities with which my early associations have been connected, but also on the whole railway line of country from Dublin to the southern limit of my tour, but also through more eastern districts, not yet united with the trunk line.

He must be a dull observer who has no pleasurable impressions on entering the Bay of Dublin, surrounded by an infinite number of suburban terraces, rows, and villas of all dimensions and characters, embellishing the whole area of space around the foreground of a magnificent amphitheatre, backed by mountains of considerable elevation. My first impressions were, however, modified considerably after a few days' observation of the detailed features of the panorama; incongruities became apparent, and while all the colouring of prosperity and good taste was glowingly bright in certain favoured localities, within and without the precincts of the metropolis, other parts, severed by some apparently capricious line of fashion, have remained in an unfinished state at best.

The distinction is obvious as regards the north-eastern and south-eastern streets and environs; the course of improvement, with the stream of fashion, has flowed far into the country also on the south-east side; yet, even within a short walk of Kingstown and the line of railway leading to it, and passing along the intermediate suburban residences, which have been improved so strikingly, the aspect of Irish misery is to be recognised.

The agricultural training school at Glasnevin, in connection with the National Model Farm, on the north side of the city, and not far from the celebrated Botanic Gardens of the Royal Dublin Society, was an early object of attraction to me. There considerable progress has been made. A new range of buildings, in direct continuation of the first, in order to complete the necessary accommodations for 100 resident agricultural pupils and a superintendent, has not added architectural beauty to the previously built portion, from its want of uniformity, and extreme inelegance of style; but it is an evidence that the important objects of economy, convenience, and durability, were scrupulously regarded in the design and details of the structure. The necessary offices for cattle, &c., with steam machinery, and every appropriate adjunct, are principally at the rear of, and partly at right angles with this new part of the long barrack-like row. About 80 fine-looking young fellows were at various labours on my approach to the building, through a large extent of open arable land, and many of them were engaged in planting out evergreens in well-prepared soil, to relieve the bare and bleak aspect of the buildings, not far from the front of which was a long rampart of very fine cattle Beet, carefully covered up, and apparently containing a supply of food sufficient for a great many head of cattle during a long confinement in the straw-yard. The 80 pupils are boarded, lodged, and educated at the expense of the National Education Society, and selected from young men previously educated either at minor agricultural or at elementary national schools, and of satisfactory characters and literary attainments. The period of instruction for these pupils is two years, hardly enough for any effective purpose, and quite inadequate if they should aspire to be teachers. However, there is a distinct class for agricultural teachers, previously trained in the literary department; or at least such a class is contemplated in the prospectus. I had no opportunity of ascertaining whether this class has been realised, and if so, to what extent of numbers. One year's tuition is the period of instruction for the individuals of this class; too short a term of discipline and experience. Extra pupils are admitted, on the payment of a fee of two guineas (for the purchase of agricultural books for the general library), to all the advantages of lectures on scientific and practical husbandry. The young men of this class board and lodge at their own expense in the neighbourhood, and take their full share of farm work. Each portion of the day, from 5 A.M. in the summer and 6 A.M. in the winter half year, to 9.40 P.M. throughout the year, is apportioned in an occupation time-table.

The bread, milk, butter, meat, and vegetables will, I believe, be supplied by the farm, and thus all the elements of ordinary domestic economy in the farmer's private establishment will be, if not already so, introduced into this most interesting national institution.

Moving by railway to Cork, through the counties of Dublin, Kildare, Queen's, and Tipperary, the agricultural tourist soon has evidence in the undrained and dreary-looking lands through which he travels, that he has left behind or is passing through a wide interstice between the wooded and improved portions of those counties. When he has passed the undulating down of the Curragh, so admirably suited to sheep feeding from the calcareous quality of the soil, he is passing over a cheerless expanse of bog-land, and learns that the Bog of Allen is one of the two distinguishing features of the county of Kildare, the Curragh being the other. He hardly sees the fertile and improved parts of this county; his eye rests on the passing diorama—bog, bog—undrained, ill-fenced land—straggling, crumbling furze banks—from Monastereven to Portarlington, a wretched soil. I think it was between Portarlington and Mountrath I saw a plough drawn by two donkeys, the only one I had ever seen thus yoked in Ireland. The thinness of the peaty surface earth may be inferred from this fact, and yet it is probable that limestone gravel was beneath. Having read and heard of the wondrous extent of thorough and arterial drainage throughout the country, I was surprised that fewer indications of it appeared; the roofless cabins and mouldering walls of the departed natives being far more frequent. It is not a little provoking to an Irishman who feels proud of the many fertile, well-timbered, and highly embellished and well-farmed portions of Ireland, interrupted no doubt by many incongruities, that British tourists, whether in search of the picturesque or with the intention of purchasing estates, generally see the least favourable parts of the land: going southwards, to Killarney, they either travel over parts of the vast bog of Allen, or skirt its margin, and see bare and forbidding tracts, and traverse comparatively wild and desolate regions in the counties of Cork and Kerry; and if they take the western road, the other favourite line, and visit the wilds of Connemara, they have such large expanses of rocky, boggy, treeless, and ill-cultivated land, dotted with ruined villages and forsaken cabins, and only relieved by a gentleman's house and trees here and there, that their impressions regarding the agricultural condition of Ireland must be very painful and unfavourable; and as to capitalists who had gone there with a view to the investment of money in the purchase of estates, I am by no means surprised at their deciding not to buy, except at dead bargains; so much remains to be done, in the very elementary points of land improvement, even along the leading thoroughfares from Dublin to Killarney, and from Dublin to Galway: but let these travellers diverge from the trunk lines—let them pass through Carlow, Kilkenny, and, departing from the direct Dublin and Cork line, visit Cahir, Clonmel, Carrick, Waterford, and also the parts of Wexford along the Slaney—those splendidly timbered districts, with gentlemen's seats and well-managed farms closely arrayed; or let them go by the east coast from Dublin northwards, how very different will be their impressions. Deeply disappointed as I have been with the aspect of the country from Dublin southwards by the railway line, my sensations on seeing the more eastern portions just referred to, and the decided progress which has been made in these districts, have been of the most exciting kind. But something of details will be better than a general expression of opinion. From Portarlington to Monastereven and Mountrath, the soil is a shallow layer of peat over clay, yielding however Grass, Oats, and Potatoes; the two latter in lazy beds— and wisely, because the soil is thus spade-trenched, and without this mode of tillage it would be impossible to deepen the staple of the soil, while the horses and ploughs of the small farmers are of their present feeble constitution.

As the practice of moulding the Potato plants two or three times in their beds, by scattering the soil obtained in the furrows over them, prevails in the south and west of Ir land, the sinking of the spade into the subsoil of the furrows for a supply of earth for the surface of the beds is in effect a sort of trenching, and especially advantageous in thin soils, which thus become deepened in course of time. The Dun variety of Oats is in high estimation on the inferior soils of Ireland, and in some localities it is the favourite even on good strong loams capable of producing heavy crops of Barley.

To estimate the value of land in the actual condition of a large proportion of the soil alongside of the line of railway under notice would be very difficult. I was told that 30*s.* per (Irish) acre is the probable average rent charged for the moory land about Portarlington. When the proportion of rates chargeable to the tenant is added, this is apparently a high rent. From Maryborough, southwards, for some distance, the soil seemed to be desperately bad; but I should bear in mind that the engineers of the railway would have been directed to carry it through the least valuable land on the line, and though the portion of the Queen's County at present under review shows no indications of neat farms, and hedgerows, and gentlemen's demesnes, these are to be found in other parts of the county, on the great limestone base of the central level of Ireland. It was not surprising that so few cattle were to be seen—there was no grass for them to eat; the natural barrenness of that district, combined with the backwardness of the season, accounted for this, without inferring the inability of the landowners to stock the land. The great Munster fair had passed, and very high prices had been obtained for sheep and cattle, and I was informed that the Earl of Derby had recently let farms to Englishmen in the county of Tipperary, who had given unusually high sums for live stock.

The want of trees about Thurles, as generally throughout the course of the journey, was striking. Here was a considerable breadth of land in course of tillage, but of Clover fields I scarcely saw any, and generally very little Wheat relatively with Oats and Barley. This has been chiefly occasioned by the wetness of the last months of the past year, the favourite ones for Wheat-sowing in Ireland, which obliged the farmers to substitute Barley and Oats in the succeeding spring. It is not surprising that tillage rather than the pasturing of cattle and sheep should be practised about Thurles, where there is such want of shelter. However, there is no deficiency of timber a few miles farther off; the splendid woods and plantations on Lord Hawarden's demesne of Dundrum, which comprises 2400 acres, present a very beautiful appearance, and grand mountains furnish a noble background to the picture.

It was a relief to see, at the junction with the Limerick line, very splendid land, but miserably fenced, and usually without gates; a cart, when at rest from its active labours, might be seen doing duty as a gate, and dry banks frequently occupied space where they appeared to be utterly useless—certainly so as fences, for cattle walked over them when they pleased.

(To be continued.)

THE CURING OF BACON, PORK, &c.

The pig being killed, properly dressed, hung up, opened, the entrails taken out and cleansed, and the carcase well and thoroughly cleaned, it is left to cool and set for such indefinite period as appears requisite—this, in the mildest season, should not exceed one night, and in the coldest, frost should be avoided. The following very clear and concise account of the curing of bacon is from Henderson's Treatise on Swine; he says—"After the carcase has hung up all night, lay it upon a strong table, or bench, upon its back, cut off the head close by the ears, and cut the hinder feet so far below the hough as will not disfigure the hams, and leave plenty of room to hang them by; then take a cleaving knife and if necessary a hand mallet, and divide the carcase up the middle of the back-bone, lay it in two equal halves, then cut the ham from the side by the second joint of the back-bone, which will appear on dividing the carcase, then dress the ham by paring a little off the flank or skinny part, so as to shape it with a half round point, clearing off any top fat that may appear. The curer will next take off the sharp edge along the back-bone with his knife and mallet, and slice off the first rib next the shoulder, where he will perceive a bloody vein, which he must take out, for if it is left in, that part is apt to spoil. The corners must be squared off where the ham was cut out. In killing a number of swine, what sides you may have dressed the first day lay upon some flags or boards, piling them up across each other, and giving each flitch a powdering of saltpetre, and then covering it with salt; proceed in the same manner with the hams, by themselves, and do not omit giving them a little saltpetre, as it opens the pores of the flesh to receive the salt, and besides gives the ham a pleasant flavour, and makes it more juicy. Let them lie in this state about a week, then turn those on the top undermost, giving them a fresh salting; after lying two or three weeks longer they may be hung up to dry in some chimney, or smoke-house, or if the curer chooses he may turn them over again without giving them any more salt, in which state they may lie for a month or two without catching any harm, until he has convenience for drying them."

Pickled Pork.—The carcase, if intended for pork for pickling, is cut into small pieces, and is packed away in tubs or kits as follows:—Rub the pork with saltpetre and common salt; then spread common salt on the bottom of the tub or kit, about an inch thick, and lay in the pork close; cover it with salt, fill every crevice, and make all as firm and compact as possible; then lay in another quantity of pork with salt in the same manner. Proceed thus till within three inches of the top, when the tub or kit must be filled "with salt, pressing it hard down," and cover it with an air-tight covering, as upon the exclusion of the air depends the success. Another plan is to pack the pork in a tub or kit, and pour over it a strong brine made by dissolving salt in water, adding a little saltpetre, boiling it, letting it cool again, and then pour it upon the pork so as to cover it, when it should be closely headed up. In pickling for the navy, a slight deviation from the latter mode is made. It is all cut up as nearly as possible of equal size and weight; "it is thrown into large tubs containing a preparation of strong pickle, formed of salt and saltpetre; when cured it is put in barrels, the bottom of the cask being covered with a layer of bay salt, then a layer of pork, another layer of salt, and so on alternately until the cask is nearly filled; then a layer of salt is laid on the top, and the cask headed up. The fresh pickle out of which the pork has been taken is then saturated with salt and poured through a hole left in the head of the cask for the purpose; when the cask is full the hole is plugged up and the cask sent to market." In some districts the common practice before curing is to take out all the bony parts, as the spare-ribs and the loin bones; these are eaten as fresh meat; the spare-ribs are roasted; the loin is generally made into pies.

Much of the success in the curing of bacon and the pickling of pork depends upon the precise condition of the carcase and the state of the weather. Many old housekeepers will not have their pigs salted in the wane of the moon; this is preposterous, but it is evidence of the influence of the weather. It has, however, been clearly ascertained that changeable weather is highly injurious; that sultry, moist, and oppressive weather, *i. e*, when the air is much charged with electricity, has an extremely prejudicial influence; that excess of moisture in the atmosphere is hurtful, but that hot weather with a dry atmosphere is not injurious, further than to prevent the proper cooling or setting of the meat; that severe frosty or intensely cold weather is not prejudicial, but that frozen meat will take salt freely on thawing, and remains perfectly fresh through the longest frost; the changeable weather of the winter is not so baneful as that of the summer.

The precise condition of the carcase is of great moment to successful curing. The flesh from well-fed pigs is much more readily and safely cured than from those ill-fed. Sound firm meat will take salt better, and absorb more of it than their soft and flabby meat. On no account should the pig be killed in a hot and feverish state; driving fat pigs to the slaughter in cold weather does injury, but in hot weather it is certain to spoil the meat. If the meat is but slightly heated it can scarcely be preserved—the great difficulty being to make it take salt freely enough. There is considerable difficulty in curing pork in hot weather, but it is much practised in many counties, and is the principal animal food of the inhabitants. The usual custom is to kill the pig in the evening, hang the carcase in the coldest place to be found till morning, cut it up and pack it away before the day waxes hot: a cold cellar is preferred for pickling. This pork is ready for consumption in two or three weeks. Bacon and hams are much injured by skippers when they are hung up, as in farmers' kitchens. Bacon flitches, as also hams, should be pasted over with brown paper—the hams hung up in bags made of harding.

The recipes for curing bacon, pork, and more especially hams, are innumerable; the following is an old one:—Take 3 oz. of saltpetre and rub over the ham, let it be till next day, then take ½ lb. bay salt, ½ lb. common salt, ½ lb. coarse sugar, a pint of beer-vinegar, and a pint of old ale, boil these all together, and pour the mixture boiling hot upon the ham; baste the ham with the pickle, and turn it twice a day for three weeks, then rub it over with Barleymeal, and hang it up to dry. This will suffice for a large ham.

In curing bacon, &c., all those parts of the carcase

usually converted into lard are taken out. The leaf from the inside of each flitch, the caul and other loose bits of fat (the caul being well washed may be used with the leaf), these are cut into small pieces or squares, and placed with a little water in a boiler to be melted or rendered down, during which process it requires constant attention, to prevent burning or injury to the lard. It is then strained and poured into prepared vessels, or into bladders. It keeps best in the latter, and is generally sold in bladders; if nicely melted, and sweet, it will fetch a good price. The parts of the squares not melted are left to drain; they are called scraps, and are generally considered an attractive dish on a farmer's breakfast-table. In large establishments they are pressed into large cakes, called greaves or graves, and sold as food for dogs, pigs, &c.

The offal or rather the head, feet, shanks, &c.—for literally the pig might be said to be without offal, every part being made available in some way or other for food—the head when cured and dried is eaten with great relish as an accompaniment to veal, fowl, &c.; the fat and shanks or houghs make a capital addition to the breakfast provisions, or when boiled down and made into brawn they are considered a delicacy. "Pig's fry" is universally known and eaten; it is made from the liver, kidneys, sweet-bread, and caul, with a little addition of fresh pork. Pork pie is in high esteem; it is made from the small and unconvertible pieces. Aselet is much prized; it is similar pieces inclosed in the skin of the "leaf" named above. Mince pies are made from the pluck or lungs. Sausages are greatly in favour; these are the finer portions of lean meat and fat chopped into a pulp, and enclosed in the small intestines. The tongue will pass for rein-deer tongue. Besides these dishes of extraordinary popularity, there are others of less note. The stomach and large intestines are made into first-rate tripe or chitterlings; and the blood, mixed with lard and other approved accessories, is inclosed in a large intestine, and is known as black pudding. The skin is appropriated by the saddler, and the bristles by the brushmaker and shoemaker. In many parts of the country it is customary to smoke-dry bacon and hams. *J. C.*

COMMON SALT AS A MANURE.

Common salt has been employed in all ages and in all countries, for the purposes of promoting vegetation, and has been found especially useful in inland countries. In some districts it has failed to produce any beneficial effects upon the growing crop, and has consequently suffered in the high estimation in which it was held in England about a century ago. Still, salt is largely employed for manuring purposes, and there can therefore be little doubt, that in many cases it produces a sensible improvement in various crops. Its use has been particularly recommended for the cereal crops; and numerous experiments have been published from time to time, in which the application of salt has produced a considerable increase in the yield of Wheat, Barley, and Oats. Thus Mr. C. Johnson found it answer exceedingly well on a light and gravelly soil, at Great Totham, in Essex. The produce per acre, on a part which had not been manured for four years, was found to be 17 bushels and 26 lbs.; and on a part, which he manured with 5 bushels of salt per acre, and which likewise had not received any manure whatever for four years, the yield of Wheat amounted to 26 bushels and 12 lbs. In a comparative experiment on a part which he manured with stable dung, to a crop of Potatoes in the preceding year, he obtained 26 bushels and 52 lbs. Mr. C. Johnson is, accordingly, a great advocate for salt as a manure for Wheat, and recommends it to be applied some time before sowing the seed, in a dose of no less than 10 bushels and not more than 20 bushels per acre. Mr. G. Sinclair, Mr. Fleming of Barochan, Mr. Hannam, and many others, speak highly of salt as manure for Wheat. The use of salt was found less beneficial by Mr. Fleming on Oats. In an experimental trial the produce of the unsalted portion of the field was 51 bushels, and that of the portion manured with 3 cwt. of salt, 53 bushels; the increase thus amounted to 2 bushels only. On Barley, a very large increase was obtained by Mr. Ransome, in Suffolk. No salt gave 30 bushels; and 16 bushels of salt raised the produce to 51 bushels. We abstain from mentioning any other experiments in which salt has been tried on corn crops, because they have, for the greater part, not been conducted with the requisite care and accuracy. Salt is said to give strength to the straw, and theoretical reasoning leads us to expect this; but whether it is the case or not, has never been determined as yet by any direct experiments. Neither theoretical speculation, vague statements, nor solitary practical observations, can establish so important a fact, which can only be proved by the rigorous tests of a series of well-conducted comparative experiments. The use of salt for root crops has also been highly recommended; and in some experiments by Mr. M'Lean of Braidwood, Mid-Lothian, a considerable increase in the Turnip crop was obtained, by the addition of 4 cwt. of salt to thirty carts of dung per acre. Root crops, especially Mangolds, contain a considerable proportion of common salt, and it is therefore very probable that they will be benefited by a generous supply. It has been estimated by Mr. Way ("Roy. Agr. Soc. Journal," viii., p. 186), that Turnips contain, according to the average of his trials, about 2 lbs. of common salt in every ton of bulbs; and Mangold-Wurzel, 6½ lbs. These analytical remarks lead us to expect that salt will be highly favourable to the luxuriant growth of root crops, and in an especial manner to that of Mangold-Wurzel. It is well known that a saturated solution of salt is capable of killing weeds; and we know further, that some plants are injured by a dose of salt, which decidedly improves others. There have been made as yet few precise experiments, with a view of determining in what quantities, and under what conditions, salt exercises a beneficial effect upon our various cultivated crops. That salt affects various plants differently will be seen from a series of experiments which were made some years ago by Dr. Voelcker, with a view of ascertaining in what quantities salt exercises an injurious, and when a beneficial effect. The following is the summary of the results of these experiments:—

1. Salt solutions, containing 3 grains of salt per imperial pint, or 6 grains, 12 grains, and even 24 grains of salt per pint, produced no injurious effects on Cabbages, Field-Beans, Onions, Lentils, Chickweed (Stellaria media), Groundsel (Senecio vulgaris), Thistle (Carduus pratensis), Annual Meadow-Grass (Poa annua), Radishes (common long red variety), which were regularly watered with these solutions during two months. Plants of Anthoxanthum odoratum (Sweet-scented Vernal) were killed by a solution containing 24 grains of salt per pint, after the lapse of one month.

2. Such weak solutions appeared to benefit most plants experimented upon, especially Cabbage, Radishes, and Lentils. All had a fresher and more luxuriant appearance than those watered with rain water only. The Leutils, which were watered with a salt solution containing 24 grains per pint, were nearly one-half larger in size than those watered with 6 grains of salt to the pint, and these again appeared more vigorous than the Lentils which received no salt at all.

3. Salt solutions, containing 48 grains of salt, exercised a prejudicial effect in the course of a month on Lentils, Chickweed, Groundsel, and the annual meadow Grass. They had no injurious effects on Cabbages, field Beans, Onions, Radishes, and Thistles.

4. Salt solutions, containing 96 grains of salt per pint, exercised an injurious effect upon Cabbages and field Beans, but did not injure Onions, Radishes, and Thistles, regularly watered with such solutions during two months.

5. Cabbages will continue to grow, though sickly, when watered regularly during a month with a salt solution, containing 192 grains of salt per pint, and even when watered with a solution containing 384 grains of salt per pint.

6. A solution of salt, containing 192 grains per pint, now proved prejudicial to Onions regularly watered with it during one month.

7. A solution, containing 24 grains of salt to the pint, decidedly benefited Radishes, Onions, Lentils, and Cabbages.

8. Grasses are affected by salt more readily than any other of the plants experimented upon.

9. Bulbous plants, and plants with succulent leaves are especially benefited by the application of salt.

Many of the plants in these experiments had taken up so large a quantity of salt, that they tasted quite saline; but, notwithstanding this, they grew healthily. This evidently shows that salt, in a moderately dilute solution, can be taken up by many plants without exercising a pernicious effect. In many cases in which salt was applied to the land, it has failed to produce any sensible improvement of the growing crop; but in examining the circumstances under which it was unsuccessfully employed, we shall frequently be able to point out the cause of the failure, if we pay due regard to the following considerations:—

1. The neighbourhood of the sea must necessarily interfere with its action. On land situated along or near the sea-coast, or which is exposed to the action of prevailing sea-winds, the application of salt will prove useless; because the soil in such localities contains already more than is sufficient to satisfy the wants of the growing crops. It is well known that the spray of the sea is constantly borne by the winds, and sometimes strewed upon the land at a great distance. Moreover, the clouds which form over the sea always contain a greater or less quantity of salt, which will be deposited in the soil by the rain. In England, rain seldom falls anywhere in which a sensible portion of common salt cannot be detected; and this circumstance no doubt explains at once why, on the whole, the application of salt to the land, in continental countries, has been attended with much better results than in England. Calculating the fall of rain at 31 inches per annum, Dr. Madden has determined, by analysis, that the rain which falls at Penicuik brings down upon each acre of land in that neighbourhood 641 lbs, or nearly 6 cwt. of salt. Dr. Madden has shown, also, that nearly all the failures which are described in the *Quarterly Journal of Agriculture*, September, 1842, page 574, were experienced on farms which are more or less freely exposed to the winds from the east or west sea.

2. Some soils, in inland districts, also, contain much salt; and the presence of deposits of salt, or the occurrence of salt springs, affords excellent indications, that on land, in the neighbourhood of localities where such deposits or saline springs occur, the application of salt will, in all likelihood, be unprofitable.

3. It must not be forgotten that salt is not a universal manure, and that for this reason it cannot supersede the use of other manures. Indeed, if land is out of condition, salt applied alone will do little to raise its fertility.

4. On farms where salt is given with the food to the stock, the manure which is made must necessarily contain much salt; so much, indeed, that in many instances the special application of salt to the land which has been dressed with such manure will be altogether superfluous.

5. In dry seasons common salt, like all other saline manures, exercises no effect if it be supplied to the land in moderate quantities, and may prove prejudicial when used in large doses. With respect to the theory of the action of common salt, when applied alone to the land, we would observe that it may exercise a beneficial effect upon most plants, for the following reasons:—

1. Common salt exists in greater or less proportion as such in all our cultivated plants. Several, naturally growing near the sea-coast, require considerable quantities for coming to perfection. One of the functions of salt will therefore be to supply plants with this necessary alimentary constituent.

2. According to Sprengel and Meyen, the leaves of plants give off chlorine in the dark. The chlorine must arise from the decomposition of a chloride, in all probability, from chloride of sodium, or common salt. The soda which is thus produced may act upon the constituents in the sap in a variety of ways, and produce effects highly conducive to the luxuriant growth of plants.

3. It is stated by Berthollet that, in a calcareous soil, common salt is gradually decomposed by the carbonate of lime which the soil contains. By a double decomposition, carbonate of soda and chloride of calcium are formed; and as carbonate of soda has the property of dissolving silica, we can in some measure explain the effects of salt by the circumstance that it supplies indirectly silica, which is so essential a constituent of many plants. Carbonate of soda not only dissolves silica, and may supply it to the plant in a readily-available form, but it is also a solvent for phosphoric acid, organic acids, &c., and may, therefore, exercise a beneficial effect by carrying these constituents into the vegetable organism, in combinations highly favourable to the healthy condition of plants.

4. Professor Way has lately shown that silicate of ammonia is much more soluble in a solution of common salt than in pure water. His researches render it very probable that silicate of ammonia fulfils the important function of carrying silica into our cereals, and depositing it on the surface of their leaves and stalks. Now, if silicate of ammonia is really the chief source from which the silica in our cereals is derived, the use of salt in growing corn can be intelligibly explained by the great solubility of silicate of ammonia in a salt solution. "If it be in any degree correct," Professor Way observes, "then the action of common salt in strengthening and brightening the straw of Wheat and Barley, which is the best ascertained of its effects as manure, is immediately traceable to the greater solubility of the silicate of ammonia in a saline solution." *Dr. Voelcker in the last number of Blackie's Cyclopedia of Agriculture*

Home Correspondence.

Sheep Feeding on Dartmoor.—In your *Gazette* of the 10th December last, Mr. G. W. Fowler, Prince Hall, Dartmoor, referring to a paper read by me to the Fettercairn Farmers' Club on "Sheep Feeding under cover," copied into your Paper of 26th Nov., makes some remarks upon the "dismal results" of my feeding, compared with his own, and which he attributes to the breed of sheep. In answer to Mr. Fowler's observations (which reply you inserted in your Paper of the 24th December), after giving him the information he asked as to my breed of sheep, I expressed an opinion that the difference in our results might be probably referable to climate rather than breed; but suggested that, to enable your readers to contrast the difference of profit, the value of the "hog," when put up ought to be stated, as well as the subsequent expense of feeding. Mr. Fowler, in your Paper of Jan. 7, in reply, gives the weight of his hogs when put up, and adds that they cost only a halfpenny per day for purchased food, but did not meet my suggestion by stating how the animals were fed, and what was the whole cost of his mode of treatment. I find in your *Gazette* of March 18 the information (extracted from the "Journal of the Bath and West of England Society") which enables me to place before your readers the details of the treatment, with the success of which Mr. Fowler seems so well satisfied as compared with mine. In my paper, read to the Fettercairn Club, I showed, as the result of two years' experience, a gross sale of 31*s.* 6*d.* and 29*s.* per head, average 30*s.* 3*d.*; and an expense incurred of 11*s.* 6*d.* and 10*s.* 6*d.*, average 11*s.*; leaving a net price obtained for my hogs, when put up, of 19*s.* 3*d.*, and this for 120 sheep. The difference betwixt 19*s.* 3*d.* and the market value of the hog when put up constitutes the net profit on the mode of house-feeding adopted. My valuation (which I believe to be their market value) was 15*s.* 6*d.*; consequently the profit per head, 3*s.* 9*d.*, exclusive of the increased value of the manure so produced. Let me compare this with Mr. Fowler's treatment:—

	£	s.	d.
124 days on cut Swedes (21 lbs. per day), at 10*s.* per ton	£0	11	9
Clover hay (2 lbs. or 3 lbs. per day, say 2½ lbs.), at 70*s.* per ton	0	9	7½
Halfpenny per day for oilcake	0	5	2
	£1	6	6½
Hog sold for	2	3	10½
Remains for the hog	0	17	4

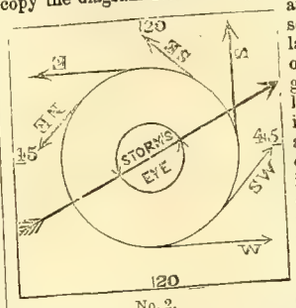
(N.B. Add fuel and attendance)

The quantities of food supplied are stated by Mr. Fowler. Am I rating hay at 3*l.* 10*s.* or Swedes at 10*s.* per ton too high, or is my calculation wrong? Then, if these articles be fairly estimated, it appears that I obtained for my hog 19*s.* 3*d.*, whereas Mr. Fowler netted

only 17*s.* 4*d.* for his, although sold at a much higher figure! As I seek information to correct or improve my practice of "feeding sheep under cover," I shall feel much obliged if Mr. Fowler will kindly point out if I have erred in my calculation of his expenditure of food, which appears to me very great even for such a result as he obtained. *William M'Inroy, The Burn, near Brechin, N.B.*

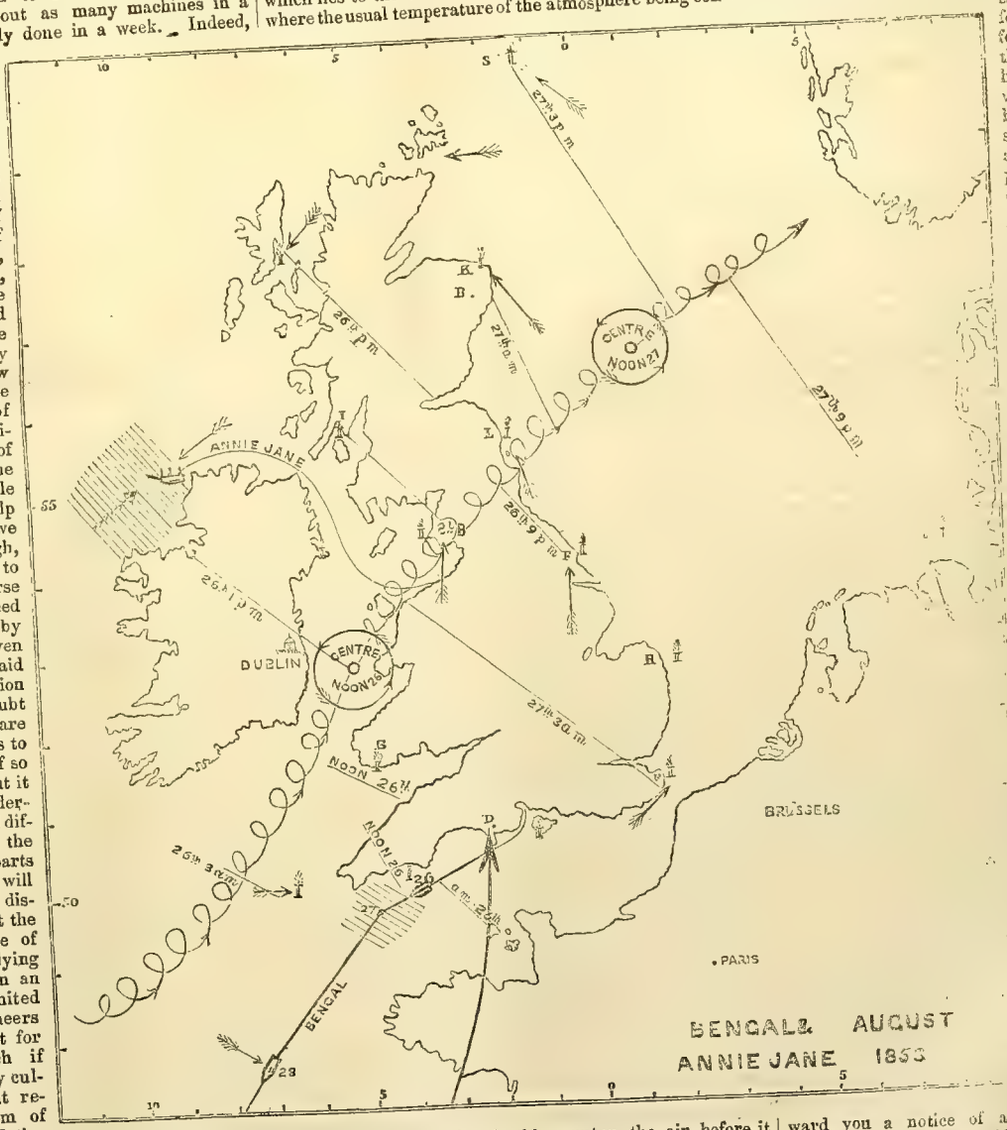
The Rotary Forking Machine.—I do not think you will deem it an abuse of your columns, if I endeavour, through their instrumentality, to call attention, at this season, to the forking machine which I introduced last year, and which found its way so rapidly into public favour, until its adoption received a check from the expectation held out on no mean authority that a steam cultivating engine would forthwith be introduced to the public. During many weeks I sent out one of these machines per day on the average, and you will see from the enclosed letters of persons using them, that they fully answered the expectations held out, when suddenly it was announced on the one hand that a Canadian had brought over an invention which would dig, sow, and reap, by steam, and that in a few weeks (this was last August) a machine, weighing about 30 to 35 cwt. would publicly perform those operations; on the other, the idea of forking by horse power was decried as barbarism, and the operations of existing forking machines declared to shame the very name of cultivation, by one of the most attractive writers on agricultural topics, who at the same time himself patented a steam cultivator, which he had previously described in that most charming of Georgics, the "Chronicles of a Clay Farm." The consequence was that many horse forking machines which had been previously ordered were countermanded, and the demand for them fell off to such an extent, that I have not latterly sent out as many machines in a month as I had previously done in a week. Indeed, to compare small things with great, the effect resembled that which might have been expected, in reference to guano, had the 1000*l.* prize for its artificial production at 5*l.* per ton been offered in the earliest stage of its introduction. Now if there be any advantage, *i. e.*, profit, in deep tillage, and if my forking machine effects it, then it is absurd to reject its use because it is not propelled by steam. I do not know what is the present stage of progress of either of the inventions, the anticipated introduction of which was so fatal to the progress of my humble tool, but I cannot help repeating it, so long as we do not disdain to plough, to harrow, to roll, to scarify, to sow by horse power, I think we need not hesitate to fork by the same means, even if we are to have the aid of steam in this operation before long. No doubt many earnest men are directing their talents to the accomplishment of so desirable a result; but it must be clearly understood what is the real difficulty. It is not the arrangement of such parts of a machine as will abrade or otherwise disintegrate the soil, but the discovery of a mode of generating and applying the force of steam in an engine of such limited weight as our engineers have hitherto sought for in vain, and which if found would not only cultivate our fields, but reduce the engine-room of our steam-ships, and the cost of the permanent way of our railroads by 70 or 80 per cent. I must not omit to allude to the draught of my forking machine. Many persons are working the largest size with five good horses, but to meet the circumstances of those who have not so much power at their disposal, I have constructed a narrower implement which, with three or four horses, will fork as many acres per day, which cannot be considered an extravagant application of power. Mr. Wilmot, of Congleton, who uses the large machine, puts a horse in the shafts and four oxen in front, and the same plan has been adopted in Cuba with perfect success. *B. Samuelson, Britannia Works, Banbury, March* 28.

Snowstorm of Jan. 2—5, 1854 (continued from p. 203).—I have stated that at the time this storm occurred my opinion was that it came from the southward and westward; that probably it passed between England and Ireland; that it crossed this island in an easterly or north-easterly direction; and that this opinion was based—1. On the high temperature of the air; 2. On the great amount of rain; 3. On the length of time the storm lasted. That your readers may more readily follow my train of reasoning, I annex two diagrams. The spiral line in the lower one represents the course along which I supposed the centre of the storm to have travelled; the small lines drawn from this to the various points of observation indicate the period at which the greatest depression of the barometer is recorded. The small arrows indicate the various directions of the wind at noon of the 26th. The former show the storm to have been progressive, the latter rotary; and l, as regards the high temperature of the air at the commencement of the storm, if my young readers will copy the diagram No. 2 on a piece of transparent paper, and lay it on a globe, so that the lines of latitude and longitude of the diagram and globe may respectively coincide; and then, if they will describe a circle with a radius of 20 degrees, imagining the moveable leg of the pair of compasses to represent the wind moving in a circle, they will see that before the air coming from the south-



No. 2.

ward could reach the coast of Dorsetshire, it must have passed over that portion of the North Atlantic Ocean which lies to the westward of Africa and the Peninsula, where the usual temperature of the atmosphere being considerably higher than in this country, the air before it reaches us must be warmed to a temperature of several degrees above that of the atmosphere of these islands. Had this storm come from the north of west (viz., from Newfoundland) it would have brought cold air, as may be seen by setting one leg of the compasses in latitude 55° instead of 45°, and then it will be seen that before the air could have reached, as it must have passed from so high a latitude, viz., the frigid zone, that it would have been sensibly cooled, and consequently that the rain which it brought, instead of being warm, would have been cold. 2. The great amount of rain by which this storm was attended, led me to infer that it came from a southerly direction, inasmuch as most of those storms of this nature, which I have succeeded in tracing, come from that quarter. I particularly instance one, that passed over England on the 3d and 4th April, 1850, which was a perfect deluge. And the cause of this phenomenon is very evident, and very easily to be explained, if we consider to what rain is owing. Rain is the precipitated moisture held in suspense in the higher regions of the air, and condensed by coming in contact with some colder medium. When that condensed moisture becomes excessive, or, in popular language, when the clouds have more water than they can hold, that moisture becomes rain. The moisture of the atmosphere is caused by evaporation, being the effect of the warm rays of the sun acting on the surface of the globe. This we frequently observe on Grass lands in summer evenings; the evaporation during the daytime is not noticed, because the air is warmer than the earth, but as soon as the heat of the sun is withdrawn the air becomes colder than the earth, and the evaporation from the moist Grass land coming in contact with the colder medium of the evening air is condensed and becomes fog, or mist. Therefore the greater the heat the greater the amount of evaporation, the moisture of which being carried upwards becomes cloud, in proportion to the amount of condensation; the greater the amount of condensed moisture, the greater the amount to be precipitated, that is to say, the greater quantity of rain will be the result. Now, it is hardly necessary to say that hot and cold are only so by comparison. Water at a temperature of 70° or 80°, which is very pleasant for the face or hands, would be disagreeably chilly as a bath for the body accustomed to be protected from the effect of the air by suitable clothing. I recollect well, being struck with the force of relative terms on the occasion of visiting those remarkable caverns with which the limestone hills of Franconia abound. The heat of the day had been intense, so our expedition was postponed until the cool shadows of the evening, which was perfectly delightful in comparison with the blaze of the noontide sun. We visited the caverns, and I shall never forget the feeling of suffocation on emerging from them into the oven-like heat of the outer air, which, cool as it seemed before entering, quite stopped our respiration after the still lower temperature of the limestone caverns. And so does the temperature of England affect the warm and moist air of the tropics when wafted into our latitude. Warm as the air may seem to us, it is nevertheless much colder than the temperature of the Cape de Verde Islands or of the Azores. If my readers will take the pair of compasses as before, they will see that the evaporated moisture of that latitude will become sensibly cooled down before it reaches us, and thus we see how it is that to us rain may feel warm at the very time that it becomes rain by condensation. This explanation shows us how it happens that we rarely have rain with a north-westerly wind. As the air which then reaches us comes from a colder latitude any moisture which it might contain, instead of being condensed and precipitated, is rarified and evaporated. It would be irrelevant at this moment to discuss the connection between this fact and the rise of the barometer, which so constantly accompanies north-westerly wind. *P. B. M.*



Aids to Labourers.—Sympathising in the remarks of "G. S." on the subject in the *Gazette* of March 20, I beg to forward you a notice of a case fully illustrating the effects resulting from aid to the labouring class given too much in the form of charity, without sufficient attention to justice, or to the ultimate issues of such help, and also of the manner in which such acts are regarded by the more intelligent members of that class. The man who drives the engine which I employ to thresh my corn has raised himself from the ordinary position of a common labourer entirely by his own well-aided intelligence, industry, and prudence. In a short chat I had with him a few days since, whilst tending his iron horse, he told me that some coals had been gratuitously distributed to the poor of the parish in which he resided, of which he was denied a share because he belonged to the neighbouring parish, where a week afterwards, there was a similar distribution, from

which he also received no benefit. I jokingly remarked, "They knew you didn't want it, John." "There," said he, "that's it; because I have tried to get on, and made better use of my money than spending it in the beer-shop, this is how I get served; while the lazy ones, and those that spend as fast as they can get, run off with the windfalls." These are very nearly his own words, and need no other comment than that which will suggest itself to every intelligent reader. *Clathrus Celatus.*

Societies.

ROYAL AGRICULTURAL SOCIETY.

MONTHLY COUNCIL, *April* 6.—Colonel CHALLONER, Trustee, in the Chair. Sixty-one new Members were elected.

FINANCES.—Mr. Raymond Barker, Chairman of the Finance Committee, presented the monthly Report on the accounts of the Society, from which it appeared that the current cash-balance then in the hands of the bankers was 1364*l.*

CHEMICAL GRANTS.—Sir John V. B. Johnstone, Bart., M.P., laid before the Council the Report of the Chemical Committee, which was read and adopted.

LINCOLN MEETING.—Colonel Challoner presented the Report of the General Lincoln Committee, which was also read and adopted. It had reference to the arrangements connected with the dinner of the Society at the ensuing country meeting, to be held at Lincoln in July next; and to the plan of the cattle, implement, and trial yards, drawn out by Mr. Brandreth Gibbs, the honorary director of the Show, and adopted by the Committee.

MEMBER OF COUNCIL.—On the motion of Colonel Challoner, seconded by Mr. Brandreth, Charles Towneley, Esq., of Towneley Park, in the county of Lancaster, was elected one of the general members of Council, to supply the vacancy created by the transfer of Sir John Villiers Shelley, Bart., M.P., to the class of Trustees.

COUNTRY MEETING OF 1855.—A memorial was received from the authorities of Carlisle, inviting the Council to select that city as the place of the Society's country meeting of next year. The Council requested Mr. Raymond Barker, Mr. Brandreth Gibbs, Mr. Fisher Hobbs, Mr. Brandreth, and Mr. Cavendish to form an Inspection Committee, for the purpose of visiting the proposed localities, and of reporting to the Council, at their next monthly meeting, the respective capabilities of the several sites and edifices required for carrying out the objects of the meeting.

ARRANGEMENTS FOR COUNTRY MEETINGS.—On the motion of Mr. Raymond Barker, seconded by Mr. Brandreth, it was resolved—"That the Council reserves to itself the right to adopt at all country meetings such arrangements as may seem most conducive to the general objects of the Society, without binding itself to adopt or follow the arrangements of previous years."

LECTURES.—On the motion of Mr. Thompson, seconded by Sir John Shelley, the following arrangements were made for the delivery of lectures at weekly meetings of the Council, held at 12 o'clock at noon, and open to all members of the Society:—

May 10.—Prof. WAY: On the progress made in the manufacture of artificial manures.

May 17, *and May* 24.—Prof. SIMONDS: On the particular indications of the ages of animals, furnished by the structure of the teeth and the general developments of growth, in cattle, sheep, and pigs.

May 31.—Prof. WAY: On the nature and use of peat charcoal, and other deodorising substances, in reference to agriculture.

June 21.—Prof WAY: On the absorbent nature of soils.

MAD DOGS.—Sir John Shelley took that opportunity of stating, that on inquiry at the Home Office, he had found that, in consequence of the representation made by the Council at their last meeting to Lord Palmerston, on the increase of mad dogs in the neighbourhood of the metropolis, attacking not only persons in the streets, but committing ravages on the live-stock of farmers, his lordship had given orders to the police to take possession of all dogs found at large and unowned. Under this salutary regulation, Sir John Shelley had reason to believe that several suspicious animals roaming abroad in the streets had already been removed, and being unclaimed had been shot.

PRIZE ESSAYS.—Mr. Pusey, as Chairman of the Journal Committee, transmitted to the Council the following awards, made by the judges of Essays and Reports:—

I. To LEWIS HENRY RUEGG, of Sherborne; the Prize of 50*l.* for the best Report on the Farming of Dorsetshire.

II. To CLARE SEWELL READ, of Watlington; the Prize of 50*l.* for the best Report on the Farming of Oxfordshire.

III. To JOHN ALGERNON CLARKE, of Long-Sutton; the Prize of 50*l.* for the best account of Trunk or Arterial Drainage.

IV. To EDWARD E. AGATE, of Horsham; the Prize of 10*l.* for the best essay on the Autumn Cleaning of Stubbles.—The essay in this class, bearing the motto: "Practice with Science," was commended by the judges.

Adjourned over Passion and Easter weeks to the 26th of April.

SOCIETY OF ARTS, *April* 5: *Agricultural Statistics.*—The following is a report of Mr. Caird's remarks at the previous meeting:—Mr. Caird said, he thought they must be all agreed that agricultural statistics, in a national point of view, were of the greatest importance, but imagined that if they taxed the farmer for that which was intended as a national benefit, they would set him against them at once. The quantity of grain sold annually in the English market amounted to 40 millions of quarters; and if accurate statistics should prevent the fluctuation of prices to the extent of only 1*s.* a quarter, the sum gained would amount to two millions sterling, which would pay for collecting the agricultural statistics of this country for the next century. He thought, after the paper which had been already read, that it was quite unnecessary to urge the importance of the subject; but he would read to the meeting a plan for collecting the statistics which he had prepared, upon the principle that it would be improper that they should demand of the farmer information as to his private affairs. With regard to the suggestion for sending out commissioners to instruct the farmers how to fill up the returns, he would observe, that during a very extensive experience, he had always met with the greatest civility from farmers, and a desire to give him every information which would be publicly useful and not privately injurious, but he considered such a commission entirely unnecessary.
